Final
Subsequent Environmental Impact Report

Santa Clara Valley Water District
Stream Maintenance Program Renewal
2027-2036

Volume II of II

State Clearinghouse No. 2000102055

Prepared for:
Santa Clara Valley Water District

March 2026

2027 – 2036 STREAM MAINTENANCE PROGRAM RENEWAL

Prepared by Santa Clara Valley Water District

TABLE OF CONTENTS

Acronyms and Abbreviations ..... **xi**

Glossary of Significant Terms ..... **xxiii**

Executive Summary **ES-1**

Chapter 1 Introduction **1-1**

1.1 Valley Water 1-1
1.2 Program Background 1-1
1.3 Overview of CEQA Requirements 1-3
1.3.1 CEQA Requirements for Subsequent EIRs 1-3
1.3.2 Intended Use of this SEIR 1-5
1.4 CEQA Process 1-5
1.4.1 Notice of Preparation 1-5
1.4.2 Scoping Comments and Meeting 1-5
1.4.3 Subsequent DEIR Distribution and Public Review Process 1-6
1.4.4 Certification of the Final Subsequent EIR and Project Approval 1-7
1.5 Organization of this Subsequent DEIR 1-7

Chapter 2 Project Description **2-1**

2.1 Introduction and Background 2-1
2.2 Program Renewal Updates 2-2
2.3 Activities Not Covered 2-2
2.4 Program Purpose, Goals, and Objectives 2-3
2.4.1 Relevant Ends Policies 2-4
2.4.2 Program Goals and Objectives 2-5
2.5 Program Renewal Area 2-6
2.5.1 Channel Types and Ownership 2-6
2.6 Overview of Program Renewal Approach 2-19
2.6.1 Work Area Projections and Annual Work Plan 2-19
2.6.2 Adaptability 2-19
2.6.3 Maintenance Guidelines 2-20

2.7 Maintenance Activities 2-20
2.7.1 Vegetation Management 2-21
2.7.2 Sediment Removal 2-27
2.7.3 Bank Stabilization 2-28
2.7.4 Downed Tree Management 2-30
2.7.5 Management of Animal Conflicts 2-31
2.7.6 Minor Maintenance 2-32
2.8 Summary of Program Renewal Work Projections 2-33
2.9 Implementation and Oversight 2-33
2.9.1 Annual Work Cycle 2-33
2.9.2 Maintenance Crew, Work Durations, Equipment, and Maintenance Methods 2-35
2.10 Impact Avoidance and Minimization Measures and Compensatory mitigation 2-38
2.10.1 Programmatic Impact Avoidance and Minimization 2-38
2.10.2 Avoidance of Serpentine Habitats and Payment of Nitrogen Deposition Fees 2-38
2.10.3 Program Limits and Best Management Practices 2-39
2.10.4 Compensatory Mitigation 2-41
2.11 Permits, Approvals, and Consultation Requirements 2-47

Chapter 3 Environmental Setting and Impact Analysis 3.1-1

3.1 Introduction to the Environmental Setting and Impact Analysis 3.1-1
3.1.1 Regional Environmental Setting and Program Renewal Area 3.1-1
3.1.2 Approach to Impact Analysis 3.1-2
3.1.3 Sections Eliminated from Further Analysis 3.1-3
3.2 Aesthetics 3.2-1
3.2.1 Introduction 3.2-1
3.2.2 Regulatory Setting 3.2-2
3.2.3 Environmental Setting 3.2-3
3.2.4 Impact Analysis 3.2-6
3.3 Air Quality 3.3-1
3.3.1 Introduction 3.3-1
3.3.2 Regulatory Setting 3.3-1
3.3.3 Environmental Setting 3.3-8

3.3.4 Impact Analysis 3.3-17
3.4 Biological Resources 3.4-1
3.4.1 Introduction and Methods 3.4-1
3.4.2 Regulatory Setting 3.4-5
3.4.3 Environmental Setting 3.4-18
3.4.4 Impact Analysis 3.4-83
3.5 Cultural and Paleontological Resources 3.5-1
3.5.1 Introduction 3.5-1
3.5.2 Regulatory Setting 3.5-2
3.5.3 Environmental Setting 3.5-7
3.5.4 Impact Analysis 3.5-18
3.6 Energy 3.6-1
3.6.1 Introduction 3.6-1
3.6.2 Regulatory Setting 3.6-1
3.6.3 Environmental Setting 3.6-3
3.6.4 Impact Analysis 3.6-7
3.7 Greenhouse Gas Emissions 3.7-1
3.7.1 Introduction 3.7-1
3.7.2 Regulatory Setting 3.7-1
3.7.3 Environmental Setting 3.7-9
3.7.4 Impact Analysis 3.7-14
3.8 Hazards and Hazardous Materials 3.8-1
3.8.1 Introduction 3.8-1
3.8.2 Regulatory Setting 3.8-1
3.8.3 Environmental Setting 3.8-8
3.8.4 Impact Analysis 3.8-32
3.9 Hydrology and Geomorphology 3.9-1
3.9.1 Introduction 3.9-1
3.9.2 Regulatory Setting 3.9-1
3.9.3 Environmental Setting 3.9-6
3.9.4 Impact Analysis 3.9-23
3.10 Noise 3.10-1
3.10.1 Introduction 3.10-1
3.10.2 Regulatory Setting 3.10-3
3.10.3 Environmental Setting 3.10-11

3.10.4 Impact Analysis 3.10-13
3.11 Public Services and Utilities 3.11-1
3.11.1 Introduction 3.11-1
3.11.2 Regulatory Setting 3.11-1
3.11.3 Environmental Setting 3.11-2
3.11.4 Impact Analysis 3.11-6
3.12 Traffic and Transportation 3.12-1
3.12.1 Introduction 3.12-1
3.12.2 Regulatory Setting 3.12-1
3.12.3 Environmental Setting 3.12-2
3.12.4 Impact Analysis 3.12-8
3.13 Tribal Cultural Resources 3.13-1
3.13.1 Introduction 3.13-1
3.13.2 Regulatory Setting 3.13-1
3.13.3 Environmental Setting 3.13-3
3.13.4 Impact Analysis 3.13-4
3.14 Water Quality 3.14-1
3.14.1 Introduction 3.14-1
3.14.2 Regulatory Setting 3.14-1
3.14.3 Environmental Setting 3.14-13
3.14.4 Impact Analysis 3.14-26
3.15 Wildfire 3.15-1
3.15.1 Introduction 3.15-1
3.15.2 Regulatory Setting 3.15-1
3.15.3 Environmental Setting 3.15-4
3.15.4 Impact Analysis 3.15-8

Chapter 4. Other Statutory Considerations 4-1
4.1. Irreversible Impacts 4-1
4.2. Significant and Unavoidable Impacts 4-1
4.3. Growth-Inducing Impacts 4-2
4.4. Cumulative Impact Analysis 4-3
4.4.1. Methods Used in this Analysis 4-3
4.4.2. Cumulative Impact Analysis 4-11

Chapter 5. Alternatives Analysis 5-1

5.1 Introduction 5-1
5.2 Regulatory Requirements 5-1
5.2.1 CEQA/NEPA Requirements 5-1
5.2.2 Clean Water Act Section 401(b)(1) 5-2
5.3 Alternatives Development Process 5-2
5.3.1 Program Renewal Goals and Objectives 5-3
5.4 Alternatives Considered 5-3
5.4.1 No Project Alternative 5-5
5.4.2 Reduced Frequency Alternative 5-19
5.4.3 Limited Work in Unmodified Channels Alternative 5-30
5.4.4 Limited Activities Alternative 5-47
5.5 Comparative Summary of Alternatives 5-58
5.6 Alternatives Considered and Dismissed 5-67
5.6.1 Geomorphic Alternative 5-67
5.6.2 Watershed Approach Alternative 5-68
5.6.3 Return to As-Built Conditions Alternative 5-68
5.6.4 Modified Pajaro River Basin Alternative 5-69
5.6.5 No Herbicides Alternative 5-69
5.6.6 Reduced Extent Alternative 5-69
5.6.7 Alternative Locations 5-69
5.6.8 Reduced Time Frame Alternative 5-70
5.7 Environmentally Superior Alternative 5-70

Chapter 6. Report Preparation 6-1

Chapter 7. References 7-1

Appendices

Appendix A, Stream Maintenance Program Manual 2027-2036
Appendix B, Notice of Preparation and Comments Received
Appendix C, General Plan Policies and Ordinances
Appendix D, Air Quality and GHG Emissions Calculations
Appendix E, Special-Status Plant Species Considered but Rejected
Appendix F, Mitigation Feasibility Assessment Field Protocol
Appendix G, Pesticide Regulatory Information
Appendix H, Vehicle Miles Traveled (VMT) Calculations
Appendix I, Mitigation Monitoring and Reporting Program

List of Tables

Table ES-1. Summary of Potential Impacts and Mitigation Measures ES-29
Table 2-1. Projected Reach Lengths of Vegetation Removal Below Top of Bank, 2027–2036 2-22
Table 2-2. Summary Comparison of Program Renewal Annual Herbicide Projections and SMP-2 Projections and Actual Amounts Used 2-25
Table 2-3. Projected Reach Lengths of Sediment Removal Work, 2027–2036 2-27
Table 2-4. Bank Stabilization Methods 2-29
Table 2-5. Steelhead Distribution in Anadromous Salmonid Creeks Within the Program Renewal Area 2-30
Table 2-6. Summary of Program Renewal Projected Activities and Actual Work Completed 2-33
Table 2-7. In-Channel Herbicide Use Limits, 2027–2036 2-39
Table 2-8. Non-In-Channel Herbicide Use Limits, 2027–2036 2-40
Table 2-9. Regulatory Agency Approvals and Extensions 2-49
Table 2-10. SMP Best Management Practices 2-51
Table 3.3-1. State and Federal Ambient Air Quality Standards 3.3-2
Table 3.3-2. Bay Area Attainment Status of the State and Federal Ambient Air Quality Standards 3.3-12
Table 3.3-3. Air Monitoring Data for 2021-2023, San José (Jackson Street) Monitoring Station 3.3-16
Table 3.3-4. Existing (2023) Annual Emissions (tons) of Criteria Air Pollutants 3.3-17
Table 3.3-5. Bay Area Air District CEQA Thresholds of Significance for Criteria Air Pollutants 3.3-19
Table 3.3-6. Estimated Annual Emissions of Criteria Air Pollutants 3.3-21
Table 3.4-1. Selected Valley Water Fisheries Studies 3.4-3
Table 3.4-2. Local Tree Ordinances 3.4-17
Table 3.4-3. Special-Status Plant Species with Potential to Occur in the Program Renewal Area and Program Renewal Work Areas 3.4-44
Table 3.4-4. Special-Status Wildlife Species with Potential to Occur in the Program Renewal Area and in Program Renewal Work Areas 3.4-57
Table 3.4-5. Estimated 2027-2036 Total Impact Acreages for Upland, Riparian, Aquatic, and Wetland Communities 3.4-96
Table 3.4-6. Estimated 2027–2036 Total Impact Acreages for Sensitive Natural Communities 3.4-98

Table 3.4-7. Estimated 2027-2036 Total Program Renewal Impacts on Steelhead Habitat 3.4-145
Table 3.4-8. Estimated 2027-2036 Total Program Renewal Impacts on Pacific Lamprey Habitat 3.4-158
Table 3.4-9. Estimated 2027-2036 Total Program Renewal Impacts on Riffle Sculpin Habitat 3.4-166
Table 3.4-10. Estimated 2027-2036 Total Program Renewal Impacts on Habitat for Native, Special-Status Minnows 3.4-172
Table 3.4-11. Estimated 2027-2036 Total Program Renewal Impacts on Habitat for Estuarine, Special-Status Fish 3.4-180
Table 3.4-12. Estimated 2027-2036 Total Program Renewal Impacts on Essential Fish Habitat 3.4-187
Table 3.4-13. Estimated 2027-2036 Total Program Renewal Impacts to Habitats for California Red-Legged Frogs, California Tiger Salamanders, and Foothill Yellow-Legged Frogs 3.4-198
Table 3.4-14. Estimated 2027-2036 Total Program Renewal Impacts to Habitats for California Ridgway's Rails, California Black Rails, Salt Marsh Harvest Mice, Salt Marsh Wandering Shrews, and Alameda Song Sparrows 3.4-230
Table 3.4-15. Estimated 2027-2036 Total Program Renewal Impacts to Habitats for San Francisco Common Yellowthroats and Adjacent to Habitats for Western Snowy Plovers 3.4-241
Table 3.4-16. Estimated 2027-2036 Total Program Renewal Impacts to Habitats for Least Bell's Vireos and Yellow-Breasted Chats 3.4-250
Table 3.6-1. PWRPA 2022 Power Content Label 3.6-6
Table 3.6-2. Fuel and Electricity Consumption 3.6-9
Table 3.7-1 Goals and Strategies from the Climate Change Action Plan 3.7-6
Table 3.7-2. Valley Water Estimated GHG Emissions and Offsets 2010-2017 ..... 3.7-13
Table 3.7-3. Existing and Program Renewal Proposed Annual CO_2e Emissions 3.7-16
Table 3.7-4. Valley Water CCAP Strategies Consistency Analysis 3.7-19
Table 3.8-1. Active Hazardous Materials Sites within 1,500 Feet of Program Renewal Channels 3.8-10
Table 3.8-2. 2014-2023 Herbicide Use Locations 3.8-14
Table 3.8-3. Summary of Herbicide and Adjuvant Types Proposed for Use under Program Renewal 3.8-15
Table 3.8-4. School Facilities within 0.25 Mile of Program Renewal Channels 3.8-17

Table 3.9-1. Groundwater Management Plan Outcome Measures and Outcome Measure – Lower Thresholds 3.9-5
Table 3.9-2. Principal Creeks in Program Renewal Area Watersheds 3.9-16
Table 3.10-1. Examples of Common Noise Levels 3.10-2
Table 3.10-2. State Land Use Compatibility Standards for Community Noise Environment 3.10-4
Table 3.10-3. General Plan and Noise Ordinance Standards 3.10-6
Table 3.10-4. Typical Noise Associated with SMP Activities 3.10-14
Table 3.11-1. Status of Class III Landfills in Santa Clara County 3.11-4
Table 3.12-1. Transit Service within Santa Clara County 3.12-7
Table 3.14-1. Beneficial Uses for Surface Water Bodies and Groundwater Basins in the Program Renewal Area 3.14-5
Table 3.14-2. 303(d) List of Impaired Water Bodies and their Impairments in the Program Renewal Area 3.14-16
Table 3.14-3. Water Quality Measurements at 20 Sites in Santa Clara County – Water Year 2022 ..... 3.14-21
Table 3.14-4. Nutrient and Conventional Constituent Concentrations in Water Samples Collected at 20 Sites in Santa Clara County – Water Year 2022 ..... 3.14-22
Table 4-1. Projected Santa Clara County Household and Housing Growth, 2015–2050 4-5
Table 4-2. Valley Water Fiscal Year 2025-2029 Capital Improvement Program and Activities 4-6
Table 5-1. Comparison of Alternatives to Program Renewal 5-4
Table 5-2. Comparative Summary of Impact Determinations for the Program Renewal and Alternatives 5-60

Acronyms and Abbreviations

Abbreviation	Full Term
°C	degrees Celsius
°F	degrees Fahrenheit
µg/m^3	micrograms per cubic meter
A	
AB	Assembly Bill
ACHP	Advisory Council on Historic Preservation
ACF	Advanced Clean Fleet
ACT	Advanced Clean Trucks
AF	Acre-feet
AMM	avoidance and minimization measures
ANI	Management of Animal Conflicts (Best Management Practice)
APSA	Aboveground Petroleum Storage Act
ASR	Annual Summary Report
ATCM	Airborne Toxic Control Measures
B	
BA	Biological Assessment
BAAQMD	Bay Area Air Quality Management District
BANK/BANK_X	Bank Protection (Best Management Practice)
Basin Plan	Water Quality Control Plan
BCDC	San Francisco Bay Conservation and Development Commission
BGEPA	Bald and Golden Eagle Protection Act
bgs	below ground surface
BLM	Bureau of Land Management
BMP	Best Management Practice
BO	Biological Opinion
Btu	British thermal units

Abbreviation	Full Term
C	
CAA	Clean Air Act
CAAQS	California Ambient Air Quality Standards
CAC	County Agricultural Commissioners
CAFE	Corporate Average Fuel Economy
CalARP	California Accidental Release Prevention
Cal. Code Regs.	California Code of Regulations
CalEEMod	California Emissions Estimator Model
CalEPA	California Environmental Protection Agency
CAL FIRE	California Department of Forestry and Fire Protection
California Register	California Register of Historical Resources
Cal-IPC	California Invasive Plant Council
Cal OES	California Office of Emergency Services
Cal/OSHA	California Occupational Safety and Health Administration
CalRecycle	California Department of Resources Recycling and Recovery
Caltrans	California Department of Transportation
CAPCOA	California Air Pollution Control Officers Association
CARB	California Air Resources Board
CAS	2009 California Climate Adaptation Strategy
CASGEM	California Statewide Groundwater Elevation Monitoring Program
CBE	California State Board of Equalization
CBR	California Black Rail
CC	Central Coast
CCAP	Climate Change Action Plan
CCC steelhead	Central California Coast steelhead
CCCC	California Climate Change Center
CCR	California Clapper Rail
CDF	California Department of Finance
CDFA	California Department of Food and Agriculture
CDFW	California Department of Fish and Wildlife

Abbreviation	Full Term
CDPR	California Department of Pesticide Regulation
CEC	California Energy Commission
CEMA	California Emergency Management Agency
CEQA	California Environmental Quality Act
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CESA	California Endangered Species Act
CFC	California Fire Code
CFR	Code of Federal Regulations
CHP	California Highway Patrol
CHRIS	California Historical Resources Information System
CIP	Capital Improvement Project
CIWA	California Integrated Waste Management Act of 1989
cm	Centimeter
CMP	Congestion Management Program
CNDDB	California Natural Diversity Database
CNEL	community noise equivalent level: sound measurement that emphasizes the undesirability of noise occurring during the night
CNPS	California Native Plant Society
CNRA	California Natural Resources Agency
CO	Carbon monoxide
CO_2	Carbon dioxide
CO_2e	Carbon dioxide equivalents
County	Santa Clara County
CPAU	City of Palo Alto Utilities
CPUC	California Public Utilities Commission
CRPR	California Native Plant Society California Rare Plant Rank
CSSC	California Species of Special Concern
CWA	Clean Water Act
CWPP	Community Wildfire Protection Plan
cy	cubic yards

Abbreviation	Full Term
D	
dB	decibel
dBA	A-weighted decibel
dbh	diameter at breast height
DEH	Santa Clara County Department of Environmental Health
DO	Dissolved oxygen
DPM	Diesel particulate matter
DPS	distinct population segment
DSEIR	draft subsequent environmental impact report
DTSC	California Department of Toxic Substances Control
DWR	California Department of Water Resources
E	
EFH	Essential Fish Habitat
EIR	environmental impact report
EIS	environmental impact assessment
EMFAC	Emission Factors model
EO	Executive Order
ESA	Endangered Species Act
ESL	environmental screening level
Evelyn Project	Stevens Creek Evelyn Avenue Fish Passage Project
F	
F&G Code	California Fish and Game Code
FC	Federal Candidate
FE	Federal Endangered
FEIR	final environmental impact report
FEMA	Federal Emergency Management Agency
FESA	Federal Endangered Species Act
FHSZ	Fire Hazard Severity Zone
FHWA	Federal Highway Administration
FIFRA	Federal Insecticide, Fungicide, and Rodenticide Act

Abbreviation	Full Term
FMA	Five-Year Mitigation Area
FMP	Fishery Management Plan
FP	Fully Protected
FPE	Proposed Endangered
FPT	Proposed Threatened
fps	feet per second
FR	Federal Register
FSEIR	final subsequent environmental impact report
FT	Federal Threatened
FTA	Federal Transit Administration
FWCA	Fish and Wildlife Coordination Act
G	
gal/yr	gallons per year
GEN	Pre-project Planning and General (Best Management Practice)
GIS	geographic information system
GHG	greenhouse gas
GSA	Groundwater sustainability agency
GSP	Groundwater sustainability plan
GWh	gigawatt-hours
GWMP	Groundwater Management Plan
GWP	Global warming potential
H	
H_2S	Hydrogen sulfide
Habitat Agency	Santa Clara Valley Habitat Agency
HAZMAT	hazardous materials
HEPA	High-efficiency particulate air
HFCs	hydrofluorocarbons
Hg	mercury
HMBP	Hazardous Materials Business Plan
HMIS	Hazardous Material Inventory Statements

Abbreviation	Full Term
HMMP	Hazardous Material Management Plan
HMMP	Habitat Mitigation and Monitoring Plan
HMTA	Hazardous Materials Transportation Act
HM-X	Pesticide (Best Management Practice)
HOV	High-occupancy vehicle
HSWA	Hazardous and Solid Waste Amendments
HVAC	heating, ventilation, and air conditioning
Hwy	U.S. Highway
Hz	Hertz
I	
I-	Interstate
IAWG	Interagency Working Group
IECA	International Erosion Control Association
IEPR	Integrated Energy Policy Report
IIPMP	County-wide Integrated Invasive Plant Management Program
IIPP	Injury and Illness Prevention Program
in/sec	inches per second
IPCC	Intergovernmental Panel on Climate Change
ISA	International Society of Arboriculture
ISO	Independent System Operator
ITP	Incidental Take Permit
L	
lb	pounds
LCD	Liquid crystal display
LCFS	Low Carbon Fuel Standard
Ldn	Day-night sound level
Leq	equivalent sound level
Lmax	maximum sound level measured during the measurement period
Lmin	minimum sound level measured during the measurement period
LOS	level of service

Abbreviation	Full Term
LPG	liquefied petroleum gas
LRA	Local Responsibility Area
LUFT	Leaking underground fuel tank
Lxx	Percentile-exceeded sound level: sound level exceeded a specific percentage of time during a specific time period
M	
MBTA	Migratory Bird Treaty Act
MeHg	methylmercury
MFA	Mitigation Feasibility Assessment
mg/L	Milligrams per liter
MJHMP	Multijurisdictional Hazard Mitigation Plan
MMBtu	million British thermal units
$MMCO_2e$	million tonnes of carbon dioxide equivalents
MMPA	Marine Mammal Protection Act
MT	metric tonnes
mpg	miles per gallon
MRP	Municipal Regional Stormwater NPDES Permit
MSA	Magnuson-Stevens Fishery Conservation and Management Act
MW	megawatt
N	
N_2O	Nitrous oxide
NH_4	methane
N/A	not applicable
NAAQS	National Ambient Air Quality Standards
National Register	National Register of Historic Places
NAHC	Native American Heritage Commission
NCCP	Natural Community Conservation Plan
N.D.	no date
NEPA	National Environmental Policy Act
NF_3	Nitrogen trifluoride

Abbreviation	Full Term
NFIP	National Flood Insurance Program
NHPA	National Historic Preservation Act
NHTSA	National Highway Traffic Safety Administration
NMFS	National Marine Fisheries Service
NO_2	Nitrogen dioxide
NOA	naturally occurring asbestos
NOP	Notice of Preparation
NOx	nitrogen oxides
NPDES	National Pollutant Discharge Elimination System
NPW	Notice of Proposed Work
NRCS	Natural Resources Conservation Service
NTU	Nephelometric turbidity units
O	
O_3	ozone
OEHHA	California Office of Environmental Health Hazard Assessment
OGV	Ocean-Going Vessels
OHP	California Office of Historic Preservation
OHW	ordinary high water
OHWM	ordinary high water mark
OPR	California Governor's Office of Planning and Research
OSHA	Occupational Safety and Health Administration
P	
PAHs	Polycyclic aromatic hydrocarbons
PCBs	polychlorinated biphenyls
PCR	Post-construction Report
PFCs	perfluorocarbons
PG&E	Pacific Gas and Electric Company
PM2.5	particulate matter less than 2.5 microns in diameter
PM10	particulate matter less than 10 microns in diameter
PMA	permanently mitigated areas

Abbreviation	Full Term
Porter-Cologne Act	Porter-Cologne Water Quality Control Act
ppb	parts per billion
PPE	personal protective equipment
ppm	parts per million
PPV	peak particle velocity
Program Renewal	Stream Maintenance Program 2027-2036
Pub. Res. Code	Public Resources Code
PVC	Polyvinyl chloride
PWRPA	Power and Water Resources Pooling Authority
R	
RCRA	Resource Conservation and Recovery Act
REVEG-X	Revegetation (Best Management Practice)
RGP	Regional General Permit
ROG	reactive organic gases
RPF	Registered Professional Forester
RPS	Renewables Portfolio Standard
RSL	risk-based screening level
RWQCB	Regional Water Quality Control Board
S	
SAR	Second Assessment Report
SB	Senate Bill
SC	State Candidate
SCBWMI	Santa Clara Basin Watershed Management Initiative
SCCC steelhead	South Central California Coast steelhead
SCCFD	Santa Clara County Fire Department
SCCVCD	Santa Clara County Vector Control District
SCRWA	South County Regional Wastewater Authority
SCVURPPP	Santa Clara Valley Urban Runoff Pollution Prevention Program
SCWA	Sonoma County Water Agency
SE	State Endangered

Abbreviation	Full Term
SED / SED-X	Sediment Removal (Best Management Practice)
SEIR	subsequent environmental impact report
SFBAAB	San Francisco Bay Area Air Basin
SF_6	Sulfur hexafluoride
SFEIR	subsequent final environmental impact report
SGC	California Strategic Growth Council
SGMA	Sustainable Groundwater Management Act
SHPO	State Historic Preservation Officer
SMP	Stream Maintenance Program
SMP-1	Stream Maintenance Program 2002–2012
SMP-2	Stream Maintenance Program 2013–2023
SMP-3	Stream Maintenance Program 2027-2036

Glossary of Significant Terms

1 percent flood	Refers to a flood of a magnitude that has an estimated probability of 1 in 100 of occurring in any given year. Technically more precise way of referring to the "100-year flood." Generally, 1 percent, 2 percent, and 10 percent events refer to levels of flood flows with an expected recurrence of 100, 50, and 10 years, respectively.
100-Year Flood	Flood of a magnitude with an expected recurrence of once in 100 years. Synonymous with 1 percent flood.
Assembly Bill (AB) 32	Assembly Bill 32, the California Global Warming Solutions Act of 2006, which aimed to reduce greenhouse gas emissions to 1990 levels by 2020. See also "Senate Bill (SB) 32."
Adaptive Management	A dynamic process that recognizes that the future cannot be perfectly predicted. In response to imperfect predictions, planning and management strategies are modified as better information becomes available. It is a continuous improvement process whereby monitoring and analysis of the results of past actions are fed back into the current decision-making process.
Aggradation	Process of a channel raising its elevation through deposition of sediments. A type of fluvial geomorphic instability. See also "Degradation."
Annual Summary Report (ASR)	A yearly report summarizing the maintenance activities conducted, restoration and mitigation implemented, and other updates provided to regulatory agencies.
Annual Work Cycle	The recurring phases of planning, execution, and reporting for annual maintenance under the Program Renewal.
Alternatives	CEQA requires an EIR to examine a "reasonable range" of alternatives to the project or its location. These must include the "no project" alternative. Alternatives must be feasible, meet most of the project objectives, and reduce one or more of the project's significant effects (State CEQA Guidelines Section 15126.6).
Anadromous	A term used to describe the life history characteristics of fishes that move from saltwater to freshwater to lay eggs. The juvenile fish then move from freshwater to saltwater to grow and mature.
Annual Plant	A plant that completes its life cycle and dies in one growing season or one year (e.g., poppies, wild oat).
Annual Work Plan	The stream maintenance work identified for a given year through field inspections. Specific information, such as location, size, and type of sediment removal, vegetation management, and bank stabilization work activities, is provided in the annual work plan.

Appurtenant Structures	Accessory structures, such as storm outfalls, stream gauges, trash racks, flap gates, tide gates, bridges, vaults, wing walls, and headwalls, that are associated with channels.
Aquatic Vegetation	Herbaceous vegetation that grows in the wetted channel bottom and is typically dependent on either sustained flow or prolonged periods of water on site for survival.
Avian	Bird or bird-like.
Avoidance	Strategies for the planning, design, maintenance, and operation of Valley Water facilities to provide water supply and flood protection, and that refrain from causing significant adverse environmental impacts.
Bay Area Air District	Formerly Bay Air Quality Management District (BAAQMD), which regulates air pollution in the San Francisco Bay Area.
Bank/Bench	The area of the bank above the bankfull elevation and below the toe of levee inboard if in a reach with levee~~, and below the property line if not in a levee reach~~.
Bank Repair	See "Bank Stabilization." ~~Maintenance of existing bank stabilization structures with in-kind, in-place materials. This type of maintenance occurs when such structures fail.~~
Bank Stabilization	Bank stabilization involves any action by Valley Water to stream banks and/or beds that are eroding (repair), as well as preventive erosion protection. Valley Water implements stream bank stabilization when the problem (1) causes or could cause significant damage to a property or adjacent property, (2) is a public safety concern, (3) negatively affects transportation or recreational use, (4) negatively affects water quality, and/or (5) negatively affects riparian habitat. Bank protection stabilizes a channel bank and/or bed by using rock, rip rap, concrete, soft materials, vegetation, or a combination of materials or methods. Bank stabilization can also include preventative maintenance to ensure banks do not erode in the future. This new work is considered routine maintenance because it is either restoring the flood protection function of a modified channel, or it is repairing a natural bank to its approximate condition prior to becoming an erosion problem.
Bankfull	The river elevation (stage) at which the most effective geomorphic work occurs. This is also referred to as the *dominant discharge* and is the stage that generally corresponds to a flow event with a 1- to 2-year recurrence interval. When the channel is flowing full, the water surface is at floodplain level and the flow rate is the bankfull discharge.
Bankfull Elevation	The point where the normal channel meets the floodplain, the elevation at the top of the channel banks. When the channel is flowing full, the water surface is at floodplain level and the flow rate is the bankfull discharge.

Baseline	The environmental conditions in the vicinity of the project as they exist at the time the Notice of Preparation of an Environmental Impact Report is published.
Basin	For the purposes of the Stream Maintenance Program, a depression or valley that drains to a common waterbody. In Santa Clara County, two major hydrologic basins drain into either San Francisco Bay or Monterey Bay. In the northern portion of the county, streams of the Santa Clara Basin drain to San Francisco Bay. To the south, streams in the Pajaro River Basin drain ultimately to Monterey Bay.
Bed	The bottom of a body of water, such as a stream.
Bedload	Material moving on or within a few particle diameters above the streambed, rolling or sliding, but not carried in the water column itself. Bedload generally moves more slowly than the streamflow itself. Compare with suspended sediment. Bedload does not mean the rate of discharge of bed material. See also "Bedload Discharge."
Bedload Discharge	The rate of bedload transport; the quantity of bedload passing a given point on the channel in a unit of time.
Bench	A flat or slightly sloped area that is adjacent to a stream channel and above ordinary high water; also known as a terrace.
Berm	A raised area of earth acting as a temporary or permanent levee.
Best Management Practice (BMP)	An activity, procedure, or other standard management and work practice that provides the most effective means of preventing or reducing pollution or other adverse environmental consequences. BMPs are incorporated into project activities to avoid and minimize environmental impacts.
Biological Monitor	An individual who has academic and professional experience in biological sciences and related resource management activities as they pertain to this project; experience with construction-level biological monitoring; ability to recognize species that may be present within the project area; and familiarity with the habits and behavior of those species.
Biologist	An individual who has academic and professional experience in biological sciences and related resource management activities as they pertain to this project; ability to recognize species that may be present within the project area; and familiarity with the habits and behavior of those species. See also "Qualified Biologist."
Biotechnical	A method of bank stabilization emphasizing the incorporation of soft structures (e.g., vegetation) rather than hard structures (e.g., concrete). See also "Hard Structures" and "Soft Structures."

Box Culvert	A water channel in the shape of a rectangular concrete box.
Brackish Water	Water that is a mixture of freshwater and saltwater, with a salinity less than that of seawater.
Bypass Channel	A flood control facility through which a portion of a stream's flow is diverted at one point and reintroduced into the stream at another point downstream. Bypass channels can be used during the construction or maintenance process. Permanent bypass channels can also be designed to accommodate flood flows.
Bypass Structure	On a construction site, a generic term for any type of structure used to pond water and convey it around a work site (e.g., cofferdam, bypass pipe, channel).
California Department of Fish and Wildlife (CDFW)	A state agency responsible for the management and protection of California's fish, wildlife, and plant resources.
California Department of Pesticide Regulation (CDPR)	Regulates the sale and use of pesticides in California to protect public health and the environment.
California Environmental Quality Act (CEQA)	The California Environmental Quality Act (California Public Resources Code Sections 21000 et seq.) establishes a duty for public agencies to avoid or minimize environmental damage where feasible, recognizing that a public agency has an obligation to balance a variety of public objectives, including economic, environmental, and social factors. CEQA is intended to facilitate (1) the disclosure of the significant environmental effects of proposed activities to decision makers and the public, (2) the identification of ways to avoid or reduce environmental damage, and (3) the prevention of environmental damage by requiring the implementation of feasible alternatives or mitigation measures.
Capital Improvement Program (CIP)	A Valley Water program focused on making smart investments in infrastructure that are critical to providing safe, clean water; flood protection; and environmental stewardship to Santa Clara County. Valley Water's CIP includes a five-year plan, updated annually on a rolling basis, identifying capital projects to be implemented. For the purposes of the Stream Maintenance Program, CIP projects are large flood protection construction projects that affect the flood conveyance capacity of the stream. These projects are not considered routine stream maintenance.
California Air Resources Board (CARB)	The state agency responsible for air quality regulation and implementing climate change programs.
Certified Arborist	An individual who specializes in the care and management of trees, focusing on their health, safety, and aesthetic value.

	They assess tree conditions, diagnose diseases, and recommend treatments or preventive measures.
Channel	A natural stream that conveys water, a ditch or channel excavated for the flow of water, or the area where water is concentrated to flow across the landscape (e.g., creeks, rivers, flood control channels, and similar facilities). Channels include creeks and ditches, but do not include culverts, pipes, and other closed structures.
Channel Erosion	Includes the processes of streambank erosion, streambed scour, and degradation.
Channel Stabilization	Any action by Valley Water to repair and prevent scouring or downcutting of stream beds. See also "Bank Stabilization."
Clean Water Act	Federal Water Pollution Control Act of 1973, 33 U.S.C. §§ 1251-1387A. broad federal statute with the goal of maintaining and restoring waters of the United States. See also "Waters of the United States."
Community Noise Equivalent Level (CNEL)	Similar to day-night average sound level (Ldn) but includes an evening penalty in addition to a nighttime penalty.
Compensatory Mitigation	The restoration (re-establishment or rehabilitation), establishment (creation), enhancement, or preservation of wetlands and other resources to replace those resources impacted by maintenance activities. Specifically, compensatory mitigation is developed expressly for the purpose of compensating for unavoidable adverse impacts that remain after all appropriate and practicable avoidance and minimization of impacts have been achieved in compliance with law or requirements of regulatory agencies. (Federal Register March 6, 1995, Federal Guidance for the Establishment, Use and Operation of Mitigation Banks.) In the Stream Maintenance Program, compensatory mitigation is mitigation in perpetuity that is to be provided by Valley Water to offset significant residual impacts that cannot be avoided.
Compliance Monitoring	Continuous process that ensures an agency's compliance with policies and procedures.
Confluence	A meeting of two or more streams or rivers.
Corrective Maintenance	Corrective maintenance describes a group of work activities that are not conducted on a regular schedule but are conducted as needed to correct a specific issue.
Cultural Resources	Historical, archaeological, and tribal resources with significance to a cultural heritage.
Culvert	Any covered structure not classified as a bridge that conveys a waterway under a road or other paved area.

Cumulative Impact	Changes to the environment caused by the combined impact of past, present, and foreseeable projects.
Day-Night Average Sound Level (Ldn)	A 24-hour average sound level with added penalties for nighttime noise.
dbA	A-weighted decibel, a unit of sound level that accounts for human hearing sensitivity.
Debris	All non-sedimentary materials deposited in channels, on flood plains, or above top of bank as a result of natural conditions or through human activity, including such materials as downed trees and/or tree limbs, tires, shopping carts, trash, furniture, homeless encampments, and other items.
Debris Basin	A depression formed by the construction of a barrier or dam built at a suitable location to retain natural materials (e.g., rock, sediment, plant material) that can be conveyed along steep hillside streams during high flows. Usually placed in hillside areas where access is better for removing sediment, generally prior to entering urbanized reaches. See also "Sediment Basin."
Defensible Space	A buffer zone around a structure where vegetation has been managed to reduce wildfire risk.
Degradation	Process of a channel lowering its elevation through increased erosion, channel bed scour, or down-cutting. A type of fluvial geomorphic instability. See also "Aggradation."
Design Capacity	An engineering term used to describe the amount of water that a modified channel was designed to convey. Generally, the design capacity for improved Valley Water facilities is to accommodate the 1-percent or 100-year flood, although this can vary. This is also known as the level of protection. Capacity is measured in cubic feet per second. See also "Flood Capacity."
Design Flood	The maximum calculated discharge intended to be conveyed in the design of a capacity-constructed channel. The maximum level of flood protection used as a criterion in the design of a constructed or improved channel or waterway.
Design Flow	Flow that a facility was designed to convey.
Designated Individual	An individual who has been trained directly by a Valley Water qualified biologist and has shown proficiency in carrying out specific tasks.
Diameter at Breast Height (dbh)	A measurement of tree trunk diameter at approximately 4.5 feet above ground level. The dbh of multistem trees will be calculated by adding the dbh of the individual stems. The dbh of fast-growing multistem trees, such as willows or Acacia, will be calculated by adding the dbh of the individual stems and then dividing by two.

Downed tree management	The removal, repositioning, or retention of fallen trees (especially large woody debris) to balance habitat value and flood control needs.
Draft Environmental Impact Report (DEIR)	A preliminary version of the EIR made available for public and agency review and comment.
Drop Structure	A structure designed to convey flows over a vertical distance from a higher to a lower elevation.
Emergency	A situation is considered an "emergency" if it is a sudden, unexpected occurrence involving a clear and imminent danger that demands immediate action to prevent or mitigate loss of or damage to life, health, property, or essential public services (Public Resource Code Section 21060.3). Emergency repair or activities associated with an emergency are not addressed by the Stream Maintenance Program. Most emergency projects are exempt from review pursuant to CEQA (Public Resource Code Section 21080(b)(2), (3), (4)), although there may be post-permitting requirements.
Emergent Vegetation	Non-woody vegetation, including cattail and bulrush, that is rooted in the water but has stems and/or leaves that extend out of the water. For purposes of the Stream Maintenance Program, emergent vegetation and herbaceous vegetation are considered different categories.
Enhancement	The manipulation of a site or feature to heighten, intensify, or improve the resource. Enhancement results in a selective improvement in function and/or value but does not result in a gain in resource area.
Environmental Impact Report (EIR)	A detailed statement prepared under CEQA describing and analyzing the significant environmental impacts of a project and discussing ways to mitigate or avoid the effects.
Ephemeral	Creek that only flows for short periods of time during or immediately following a rain event.
Equivalent Continuous Sound Level (Leq)	The average sound level over a specified period.
Erosion	The detachment and movement of soil and rock fragments by water and other geological agents, which results in the wearing away of the land. When water is the eroding agent, erosional processes include sheet and rill erosion, gully erosion, and channel erosion.
Establishment	Creation; manipulation of a site to develop resource functions and values that did not previously exist at the site. Establishment results in a gain in resource area.
Federal Clean Water Act	Primary federal law governing water pollution in the U.S., aiming to ensure surface waters meet standards.

Federal Emergency Management Act (FEMA)	Federal agency responsible for coordinating disaster response and floodplain management.
Fish Ladders	A series of artificial, stepped pools that enables fish traveling upstream, against the flow of water, to span a large vertical distance in a series of gradual steps. Used at dams or other in-stream barriers.
Five-Year Mitigated Area (FMA)	Areas where a vegetation management or sediment removal activity has occurred and has been mitigated for under SMP-2. FMAs are considered to be mitigated for that impact activity and location for a period of five years after the initial impact.
Flood Capacity	The flow or volume of water a channel can carry. Capacity is dependent on cross-sectional area and frictional components (e.g., channel vegetation).
Floodplain	The relatively flat area extending from the top of a creek bank away from a creek that may be inundated occasionally during high water events.
Flood Conveyance Capacity	The ability of a water channel to carry floodwaters without overflowing its banks.
Flood Protection Facility	For purposes of the Stream Maintenance Program, any watercourse, whether natural or artificial, in which water does or may flow and that is under ownership or control of Valley Water for flood protection purposes.
Flow Conveyance	Flow that a facility was designed to convey; often dependent on channel cross-sectional properties.
Flow Rate	Measure of how quickly a volume of water moves in a creek.
Fluvial	Pertaining to rivers.
Fuel Load	The amount of combustible material (e.g., brush, trees) available in an area that contributes to fire risk.
Gabion Basket or Mattress	Galvanized wire mesh panels filled with rock, used for structural purposes. They can be connected and used for retaining walls, revetments, or bank stabilization.
Geomorphology	The study of the forms of the earth's surface and the processes that shape them. Fluvial geomorphology involves the study of streams and sediment processes: transport, erosion, storage, and deposition.
Government Code Section 51182	California statute outlining defensible space and fuel reduction requirements in high fire hazard areas.
Greenhouse Gases (GHG)	Gases which trap heat in the atmosphere and contribute to global warming.
Habitat	The specific area where environmental conditions (i.e., physical and biological conditions) are present that are

	required to support a given species. To be complete, an organism's habitat must provide all of the basic requirements of life for that species. Habitat may be occupied (i.e., individuals or a population of the species are or have recently been present) or unoccupied.
Habitat Connectivity	The degree to which habitats are connected to allow movement of wildlife and maintain ecosystem function.
Habitat Conservation Plan (HCP)	Plan under the Endangered Species Act (ESA) negotiated between the federal government and private landowners or state and local governments. These plans are designed to allow landowners to receive a federal permit to unintentionally harm listed species in the course of completing projects. In exchange for a permit, landowners agree to pursue specific management protections for threatened and endangered species. An example of an HCP is the Santa Clara Valley Habitat Plan (VHP).
Hard Structures	A type of bank stabilization structure incorporating rock, rip rap, sack concrete, gabion baskets and mattresses, or concrete. These structures are inert and rigid.
Hardscape	Concrete, rock, gabions, or other permanent, hard-surface channel or bank treatment. Refers to designs that utilize predominantly hard structures and are generally incapable of supporting vegetation. See also "Softscape" and "Hybrid."
Hazard Tree	The combination of a failure of a tree or part of a tree with the presence of an adjacent target. A hazard does not exist if there will not be an impacted target.
Headwaters	The minor drainages in the extreme upper watershed.
Herbaceous Vegetation	Non-woody vegetation, including grasses, broadleaf weeds, cattails, and bulrushes, that is rooted out of the water. This may include annuals, biennials, and perennials. For purposes of the Stream Maintenance Program, emergent vegetation and herbaceous vegetation are considered to be different categories.
Herbicide	A chemical agent used to control or inhibit plant growth.
Hybrid	For purposes of the Stream Maintenance Program, bank stabilization projects that combine hardscape and softscape. See also "Hardscape" and "Softscape."
Hydraulic Roughness	A measure of a channel's resistance to flow, influenced by vegetation, debris, and surface characteristics.
Hydrologic Basin	For the purposes of the Stream Maintenance Program, a depression or valley that drains to a common waterbody. In Santa Clara County, there are two major hydrologic basins draining into San Francisco Bay or Monterey Bay. In the northern portion of the county, streams of the Santa Clara Basin drain to San Francisco Bay. To the south, streams in the

	Pajaro River Basin drain ultimately to Monterey Bay. Each basin comprises several watersheds.
Hydrology	The science (or study) of water in the natural environment with a focus on the circulation and distribution of water as expressed in the hydrologic cycle or water balance.
Hydroseed	A process for revegetation of large areas. Plant seed, fertilizer, straw mulch, a binding agent, and green dye are mixed in a truck-mounted tank and sprayed through a hose onto the bare ground.
Impact	A strong effect of an action that leads to a change of condition. See also "Significant Environmental Impact."
Impervious Hardscape	Paved areas such as streets and sidewalks, other developed areas, or bank stabilization methods that are impenetrable to water.
Implementation Measure	An action, procedure, program, or technique that carries out policy. Implementation measures provide specific guidance to Valley Water managers and staff in the environmental review and processing of routine stream maintenance projects.
In-channel/In-stream	For the purposes of the Stream Maintenance Program, inboard levee toes to the opposite inboard levee toe. Where there is not a levee, inboard toe of the stream, ordinarily associated with "channel bottom."
In-Kind Repair	For the purposes of the Stream Maintenance Program, in-kind repair refers to repair of structures with similar materials within the same footprint.
Inlet	An arrangement for conveying surface water into an underdrain, pipe, culvert, or channel.
Instream Vegetation Removal	Physical removal of vegetation from the instream area using hand tools or other mechanical means.
Integrated Invasive Plant Management Program (IIPMP)	A program being developed by Valley Water to manage invasive plant species across countywide facilities.
Intermittent Stream	A stream that has flowing water only during certain times of the year. During dry periods, an intermittent stream may not have flowing water.
Invasive Plant	A non-native plant that, once introduced, establishes, quickly reproduces and spreads, and cause harm to the environment, economy, or human health**.** Invasive plant species may alter ecological processes such as pollination patterns, nutrient cycling, and fire regimes, and may modify canopy architecture, causing a loss of cover, nesting and foraging habitat for wildlife species. Invasive plants' aggressive growth patterns often outcompete native plant species.

Invasive Species	A plant and/or wildlife species that is non-native or alien to the ecosystem and whose introduction causes or is likely to cause environmental harm. See also "Invasive Plant."
Invert	The lowest point of the internal cross section of a pipe, culvert, or channel; the elevation of the bottom of the channel. See also "In-Channel/Instream."
Levee	An embankment constructed to prevent a river or stream from flooding adjacent lands.
Levee Toe	The point on a levee slope where the designed and constructed levee ends and natural ground begins.
Levee Top	Top area of a levee between inboard and outboard. Generally flat, but not necessarily coinciding with a levee road.
Listed Species	A species that is formally designated as endangered or threatened by the state or federal Endangered Species Act.
Long-Term Permit	A non-specific term referring to permits, authorizations, or memorandums of understanding from the United States Army Corps of Engineers, Regional Water Quality Control Boards, State Water Resources Control Board, Bay Conservation and Development Commission, and California Department of Fish and Wildlife that are effective for a specified period of time (e.g., 5 or 10 years) or an indefinite period.
Lower Watershed	Generally the watershed below (downstream of) a reservoir, including the main channel and outlet to the Bay.
Low-Flow Channel	A section of stream that carries the more frequent, periodic streamflows.
Maintenance Guidelines	Engineering documents that give guidance on maintenance requirements for design flow conveyance capacity of Valley Water flood protection facilities. The guidelines may include design details, historical information, or special requirements for a reach of channel.
Marsh Master	A mechanized vegetation management vehicle with low ground pressure used for aquatic plant control in wetland, marsh, and floodplain ~~and marsh~~ areas. The Marsh Master can be fitted with multiple attachments for mowing, cutting, discing, and applying herbicide.
Mean High Water (MHW)	In San Francisco Bay, there are two high tides each day, usually with different elevations. Mean High Water is defined as the average height of these two tides.
Mean Higher High Water (MHHW)	The average height of the higher of the two high tides in San Francisco Bay.
Mitigation	Valley Water's Board of Directors has adopted the following definition: "Action taken by Valley Water to fulfill CEQA/NEPA permit requirements and court-mandated mitigation to avoid, minimize, rectify, or reduce adverse

	environmental impacts, or to compensate for the impact(s) by replacing or providing substitute resources or environments."
Modified Channel	A waterway in which engineered alterations have occurred to improve the passage of flood flows or to provide drainage. This includes straightening (or channelization), containing a watercourse within constructed banks or levees, or lining banks with concrete, rip rap, gabions, or sack concrete.
National Environmental Policy Act (NEPA)	A U.S. environmental law that requires federal agencies to assess the environmental effects of their proposed actions.
Natural Channel	A watercourse without any significant improvements or modifications and very little evidence of historical alterations. See also "Unmodified Channel."
Natural Flood Protection	A multiple-objective approach to providing environmental quality, community benefit, and protection from creek flooding in a cost-effective manner through integrated planning and management that considers the physical, hydrologic, and ecologic functions and processes of streams within the community setting.
Nitrogen Oxides (NOx)	A group of highly reactive gases that contribute to smog and acid rain.
Non-Jurisdictional	Areas outside permitting authority of a resource agency.
Non-Native Plant	For SMP purposes, any plant species which is thought to have not been present in Santa Clara County prior to the mid-1500s CE and which was introduced by human activity.
Notice of Proposed Work (NPW)	A document submitted annually to regulatory agencies detailing proposed maintenance work and environmental considerations.
Obstruction	Material or objects that impede a facility from operating appropriately.
Ordinary High Water (OHW)	In non-tidal area, the highest level of water in a channel reached by commonly experienced flows. Defines the limit of the U.S. Army Corps of Engineers jurisdiction in the San Francisco Bay Area as the water level reached by flood flows with a predicted recurrence interval of 2.33 years.
Ordinary High Water Mark (OHWM)	Defined by the U.S. Army Corps of Engineers as the line on the bank established by the fluctuations of water indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.

~~**Orographic**~~	~~The effect that occurs when an air mass is forced from a low elevation to a higher elevation as it moves over rising terrain. The air mass cools, its relative humidity increases, and clouds may form.~~
Outfall	The end of a pipe or culvert that delivers local drainage into a creek. Features associated with an outfall structure may include erosion control materials, such as rip rap or an energy dissipater below the culvert. Further, a valve, such as a flap gate, may also be part of the outfall.
Overhanging Growth (OHG)	Vegetation growth that is hanging over maintenance roads and fence lines. Routine pruning of overhanging growth is a vegetation management activity.
Paleontological Resources	Fossilized remains or traces of prehistoric organisms.
Palustrine	Marsh-like.
Perennial Plant	A long-lived plant that typically has well-developed roots and above-ground structures. May include herbaceous plants, vines, shrubs, and trees.
Perennial Stream	A stream that has continuous flow of surface water throughout the year in a typical year.
Permanent Wetland Impact	A direct impact in which the wetland is not restored to pre-project conditions within 2 years.
Pervious Hardscape	Hardscape, such as rock rip rap, gabions, and cellular soil confinement, that is not a barrier to water infiltration and that may allow (limited) revegetation growth.
Plant Pathogen	Any organism that causes plant disease.
PM10	Particulate matter less than 10 microns in diameter, which can be inhaled and cause health issues.
PM2.5	Particulate matter less than 2.5 microns in diameter, which consists of fine particles that can penetrate deep into the lungs.
Policy	A principle of action guiding decision-making, both for individual stream maintenance projects and for the implementation of other related programs and projects. Policies are commitments made by Valley Water's Board of Directors.
Porter-Cologne Act	California law regulating water quality, enforced by Regional Water Boards.
Post-Emergent Herbicide	An herbicide designed to control target plant material after it has sprouted or following a dormant period. Post-emergent herbicides control plants by disrupting various growth mechanisms.
Preconstruction Survey	A review of the existing conditions of a site prior to the beginning of construction activity.

Pre-Emergent Herbicide	An herbicide designed to control target plant material prior to germination. Pre-emergent herbicides are applied to the soil surface, watered in through rainfall or artificial irrigation, and prevent germination and growth of seeds in the upper soil strata.
Preservation	The setting aside of an existing site to protect a resource or prevent the decline of a resource through legal or physical mechanisms. Preservation does not result in a gain of resource area or function.
Preventative Maintenance (PM)	Work activities that are conducted on a regular schedule (most often annual or biannual) to avoid facility degradation.
Permanently Mitigated Area (PMA)	An area where impacts for a particular activity were mitigated for in perpetuity during SMP-1. Work of the same activity done under the Program Renewal (SMP-3) within the PMA does not incur additional mitigation debt.
Program	A series of actions that can be described at a general level of detail. Programs include agency plans, policies, and regulatory programs.
Project Area	The area within Santa Clara County that is subject to routine Stream Maintenance Program activities. The project area includes streams and any adjacent property that Valley Water owns or for which it holds an easement for access and maintenance. Valley Water does not provide maintenance on private property when no easement exists.
Protocols	An established set of ground rules or procedures governing routine stream maintenance activities.
~~**Pruning**~~	~~The systematic removal of branches of a plant, usually a woody perennial.~~
Pub. Res. Code (Public Resources Code)	California code containing regulations related to natural resources, including environmental and fire safety standards.
Qualified Biologist	A qualified biologist is a professional biologist with a minimum of a Bachelor's degree in biology, ecology, botany, zoology, or a related discipline and at least one year of experience as a professional biologist involving a substantial amount of field work (an appropriate Master's degree with a substantial field component may substitute for work experience). The qualified biologist's education and experience will be appropriate to the species and task that they are working on.
Reach	The smallest subdivision of a drainage system consisting of a uniform length or a discrete portion of a channel.
Recharge	The replenishment of groundwater aquifers by infiltration.

Re-establishment	Manipulation of a site with the goal of returning natural/historic functions. Re-establishment results in rebuilding former resources and results in a gain in resource area and function.
Regrowth	The growth of vegetation following disruptive activities, such as trimming of vegetation or sediment removal.
Rehabilitation	Manipulation of a site with the goal of repairing natural/ historic functions. Rehabilitation results in a gain in resource function but does not result in a gain in resource area.
Residual Impact	Significant environmental impact that cannot be avoided through the implementation of feasible site-specific measures. A significant residual impact can be offset through provision of compensatory mitigation.
Restoration	Valley Water's Board of Directors has adopted the following definition, "Action taken by Valley Water, to the extent practicable, toward the re-establishment of an ecosystem's pre-disturbance structure, function, and value, where it has been degraded, damaged, or otherwise destroyed." The re-establishment of the structure and function of an ecosystem to a former or degraded site. Ecological restoration is the process of returning an ecosystem as closely as possible to pre-disturbance conditions and/or functions and values. Implicit in this definition is that ecosystems are naturally dynamic. It is therefore not possible to recreate a system exactly. The restoration process reestablishes the general structure, function, and dynamic but self-sustaining behavior of the ecosystem.
Revetment	A term used to describe any number of hard structures used in bank stabilization.
Riprap	Loose rock or concrete of varying size, typically brought to a site. Used to protect channel banks from scouring forces.
Riparian	Located along the edge of a channel, generally on the floodplain. Characterized by access to and influence of the channel, but not in it. A riparian zone or riparian area is the interface between land and a river or stream.
Riparian Corridor	A biological zone dominated by riparian vegetation immediately next to a channel. See also "Riparian Vegetation."
Riparian Vegetation	The trees and other vegetation normally found on the stream banks and flood plains associated with streams, lakes, or other bodies of water.
Riverine	Of, related to, or growing in rivers and streams.
Rootwad	A tree stump (dead or alive) with roots. May be used during restoration activities.

Routine Stream Maintenance	Routine stream maintenance includes five main activities, as follows: (1) sediment removal activities that are designed to restore the design flow conveyance capacity of existing Valley Water channels or associated features (e.g., tide gates); (2) vegetation management in and around ~~the~~ Valley Water's channels, including removal of vegetation for access and fire control; (3) bank stabilization activities necessary to protect Valley Water or other facilities; (4) downed tree management (including large woody debris); and (5) management of animal conflicts. Routine stream maintenance also includes more minor maintenance activities, such as trash removal; fence work; access road maintenance; repair of structures with in-kind materials within the same footprint (such as replacement of concrete linings, culverts, pipes, valves, or similar structures); cleaning and minor sediment removal at stream ga<u>u</u>ges, outfalls, flap gates, tide gates, fish ladders; and graffiti removal. Routine maintenance does not include emergency work.
Routine Stream Maintenance Project	For the purposes of the Stream Maintenance Program, a routine stream maintenance project is the whole of a routine stream maintenance action that is proposed for implementation through the Stream Maintenance Program. A project has a specific location, duration, and purpose. (An example of an individual project would be the removal of 3,000 cubic yards of sediment from Adobe Creek between Highway 101 and East Charleston Road.) Major construction and repair, including CIP projects, are not defined as routine stream maintenance projects. In the Stream Maintenance Program, also referred to as "individual stream maintenance project," "individual project," "stream maintenance project," and "project."
Ruderal	Vegetation containing mostly introduced, weedy herbaceous species; "disturbance-loving" species. Common in disturbed areas, along roadsides or in vacant lots.
Runoff (Surface)	The flow of water across the land surface and in stream channels. Occurs only after the local storage capacity of the landscape has been exceeded and includes both overland flow and streamflow.
Salmonid	Any member of the fish family Salmonidae.
Senate Bill (SB) 32	Senate Bill 32 expands on AB 32, requiring California to reduce GHG emissions to 40 percent below 1990 levels by 2030, among other requirements.
Scour	The clearing and digging action of flowing air or water, especially the downward erosion caused by stream water in removing material (e.g., soil, rocks) from a channel bed or bank or around in-channel structures.

Secondary Channel	For purposes of the Stream Maintenance Program, secondary channels are constructed features of a main channel that are designed with flood conveyance or maintenance purposes. These channels often have maintenance requirements that are different than the main channel and are therefore specifically managed and reported separate from the main channel.
Section 404	Refers to a section of the Clean Water Act establishing a permit program for the discharge of dredged or fill materials into Waters of the United States.
Sediment	Particles derived from rocks or biological materials that have been transported by a fluid, or solid material suspended in or settled from water.
Sediment Basin	A depression formed by the construction of a barrier or dam built at a suitable location to retain rock, sand, gravel, silt, or other material. Valley Water commonly refers to these basins as "Debris Basins."
Sediment Load	Sediment that is in transport. "Load" is a general term that refers to material in suspension and/or transport; it is not synonymous with discharge.
Sediment Removal	The act of removing sediment deposited within a stream. Typically, sediment is removed when it reduces capacity. This is the sediment removal activity referred to most often in the Stream Maintenance Program and included in the program-level impact analysis. There is a subset of sediment removal that is conducted for removing sediment 25 cubic yards or less. This latter category of sediment removal is considered "minor maintenance," as described in Chapter 3 of the Stream Maintenance Program Manual.
Sensitive Habitat	A general term used to characterize habitats that either support sensitive species (listed species, species proposed for listing, and species of special concern) or are designated as a sensitive natural community in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service.
Sensitive Species	A general term for listed (i.e., on a state or federal endangered species list) species, species proposed for listing, and species of special concern (other species that may be of concern to state or federal agencies).
Serpentine Soil/Habitat	A soil formed by the hydration and metamorphic transformation of ultramafic rock, in particular serpentinite, from the Earth's mantle. Serpentine habitat is typically host to a number of unique or rare plant species.

Shaded Riverine Aquatic (SRA) Habitat ~~(SRA)~~	The aquatic area occurring along the edge of a channel where the adjacent bank is composed of natural materials and supports riparian vegetation that overhangs or protrudes into the water and provides fish and other aquatic species habitat.
Shear Stress	The force tending to cause deformation of a material by slippage along a plane or planes parallel to the imposed stress.
Shrub	Woody plant smaller in height than a tree (less than approximately 16 feet [5 meters] at maturity), often formed by a number of vertical or semi-upright branches arising close to the ground.
Significant Environmental Impact	A significant environmental impact is a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by a project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance (CEQA Guidelines Sections 15358 and 15382).
Significant Rainfall	Local rainfall 0.5 inches or greater within a 24-hour period in the subject watershed, below the 1,000-foot contour (Program Renewal Area).
SMP-1	Valley Water's previous Stream Maintenance Program for 2002-2012.
SMP-2	Valley Water's current ~~previous~~ Stream Maintenance Program for 2013-2023~~6~~.
SMP-3	Valley Water's proposed ~~current~~ Stream Maintenance Program for 2027-2036. Also referred to as "Program Renewal."
Soft Structures	A type of bank stabilization structure incorporating biological materials, such as seeds, plants, plant parts (e.g., root wads), or a combination of vegetation and inert materials (e.g., brush mats/sills, wattles, fascines, or branch packing/layering).
Softscape	Earth channels or levees, either natural or modified that generally do not incorporate hardscape structures. Also refers to "soft forms of bank stabilization" such as root wads and log structures. See also "Hardscape" and "Hybrid."
Stakeholder	An individual or organization affected by or with an interest in the Stream Maintenance Program. Stakeholders include regulatory agency representatives, municipalities, and environmental, advocacy, community, and business groups.
Stewardship	The careful and responsible management of the environment and natural resources in one's care for the benefit of the greater community.

Stream	For the purposes of the Stream Maintenance Program, "streams" are defined as the natural watercourses and modified channels within Valley Water's jurisdiction. In this Program, streams include both the waterway and its immediate geographical corridor, including riparian corridors.
Stream Maintenance Program (SMP)	A multi-year program providing long-term guidance to Valley Water to effectively implement routine stream maintenance projects in a cost-effective and environmentally sensitive manner. The Stream Maintenance Program is to be codified in a process and policy document that can be adopted by Valley Water and utilized in obtaining long-term permits from regulatory agencies. The Stream Maintenance Program includes specific measures, protocols, and monitoring and reporting requirements to achieve the above objectives.
Stream Maintenance Project	For the purposes of the Stream Maintenance Program, a project is the whole of a set of routine stream maintenance actions that are along the same channel reach. A project has a specific location, duration, and purpose.
Streambed	The part of a stream over which a column of water moves.
Suitable Habitat	Habitat that features ecological characteristics that may provide for the breeding and or foraging of a species.
Surfactants	A shorthand term for surface-active agent, which are chemicals that modify surfaces of two liquids or a liquid and a solid. In the context of the Stream Maintenance Program, surfactants are used in combination with herbicides to increase the retention and penetration of herbicides on and into plants.
Suspended Sediment	Fine particles suspended in the water column and carried along with the water at the velocity of flow. Compare with "Bedload."
Take (of a Listed Species)	To harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect a listed species or its habitat, or to attempt to engage in any such activity.
Temporary Impact	A direct impact that does not result in permanent or long-lasting effects, such as areas of impact that are substantially restored to pre-impact conditions within 1-2 years.
Thalweg	Main channel in the creek.
Tree	A species of woody perennial that typically has one dominant vertical trunk and a height greater than 15 feet in its natural, mature form. Several exceptions to this definition exist, willows and elderberries are two examples found in the Stream Maintenance Program area which are considered trees for purposes of the Program, but which may not have a single dominant trunk.

Turbidity	The pollution of water by dissolved or suspended solids. The cloudiness of water, caused by suspended sediment. Turbidity is measured by the degree to which light penetration is blocked because the water is muddy or cloudy.
Unavoidable Impact	An unavoidable impact would occur if specific economic, social, legal, technical, or other considerations make mitigation measures or alternatives for the impact of a project infeasible. When such impacts are considered "significant," to support its decision on a project for which an EIR was prepared, a Lead Agency must prepare written findings that identify that either: (1) changes to the project are within another agency's jurisdiction and have been or should be adopted; or (2) specific economic, social, legal, technical, or other considerations make mitigation measures or alternatives infeasible (CEQA Guidelines Section 15091). In addition, the Lead Agency must adopt a Statement of Overriding Considerations that describes how the benefits of the project outweigh the unavoidable adverse environmental effects (CEQA Guidelines Sections 15092, 15096(h)).
Unmodified Channel	Channels that generally are unchanged from historic conditions. Unmodified channels may have small areas of modification, including bridges, outfalls, culverts, gauges, or other appurtenant structures. See also "Natural Channel."
Unvegetated	Areas containing either no, or only ruderal, vegetation.
Unrevetted	Without revetment (i.e., a bare slope or channel side without hardscape protection).
Upland	Areas above the normal reach of streams or rivers and characterized by non-wetland vegetation.
Upper Watershed	Generally, the steeper portion of a watershed, above reservoirs and above urban areas.
Vegetation Management/ Removal	Removal of vegetation in and adjacent to Valley Water facilities in alignment with one of the Stream Maintenance Program's vegetation management purposes.
Vegetation Removal <6 inches dbh	The complete removal of above-ground portions of any individual plant or tree with a diameter at breast height less than 6 inches. Cut stump treatment or foliar herbicide is a paired activity with vegetation removal <6 inches dbh and is assumed to occur unless otherwise noted on the work order.
Waste Discharge Requirement	A legal mechanism of the State Water Resources Control Board and Regional Water Quality Control Boards to regulate discharges of dredge or fill materials.
Waters of the United States	Tidal waters, all interstate waters, including wetlands, and all other waters including tributaries to streams and rivers which could involve interstate or foreign commerce.

Watershed	Entire area that drains to a common stream, synonymous with drainage area. Valley Water's streams are typically divided into five watersheds: Lower Peninsula, West Valley, Guadalupe, Coyote, and Pajaro.
Wetlands	Those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands are characterized by having the appropriate plant species (dependent on or capable of surviving root saturation), the appropriate hydrology (predictable saturation), and soils reflecting saturation and periodic anaerobic conditions.
Winterization	The process to maintain project sites with the appropriate best management practices (BMPs) to prevent erosion, sediment transport, and protect water quality. Winterization occurs upon completion of bank repairs or on incomplete projects after October 15 and prior to the forecast of significant rainfall, 0.5 inch or greater of rainfall within 24 hours in the subject watershed. Winterization shall be completed, when feasible, prior to the occurrence of such actual significant rainfall.
Woody Debris	Fallen trees or branches in streams that can affect flow, sediment transport, and aquatic habitat.
Woody Vegetation	Live vegetation having a stiff trunk or branch structure that is inflexible and does not bend over in flows. Typical vegetation types include trees and large shrubs.
Work Sites	The locations where maintenance activities are anticipated to occur. For the Program Renewal, such locations have been identified for the 2027-2036 timeframe.

EXECUTIVE SUMMARY

ES.1 INTRODUCTION

The Santa Clara Valley Water District (Valley Water) has developed the Stream Maintenance Program (SMP) Update (Program Renewal) to review existing SMP activities, revise the SMP Manual, and renew necessary SMP permits. The Program Renewal is considered a "project" for the purposes of the California Environmental Quality Act (CEQA).

Valley Water has prepared this draft subsequent environmental impact report (DSEIR) to provide the public, responsible agencies, and trustee agencies with information about the potential environmental effects of implementation of the Program Renewal. This DSEIR was prepared in compliance with CEQA (Public Resources Code Section 21000 et seq.) and the State CEQA Guidelines (14 California Code of Regulations [CCR] 15000 et seq.). Valley Water is the lead agency for the Program Renewal.

ES.2 PROGRAM OVERVIEW

The Program Renewal has been prepared to provide guiding policies, specific direction on approach, and regulatory authorization for routine stream maintenance activities. The Program Renewal would update the existing SMP which supported the 10-year planning period from 2012-2022 and extensions, as necessary, to meet Valley Water's new conditions or maintenance needs. The Program Renewal (including the 2027-2036 SMP Manual [**Appendix A**] and this CEQA document) is intended to cover the 10-year planning period beginning in 2027 and ending in 2036. These documents are intended to fully replace the original documents that guided the SMP from its inception through 2026. The 2027-2036 SMP Manual (included as Appendix A to this DSEIR) and the contents of the DSEIR are meant to be read as companion volumes. The DSEIR references or summarizes detailed information (including figures and tables) presented in the 2027 SMP Manual frequently to avoid repeating information.

ES.2.1 PROGRAM OBJECTIVES

The overall flood management goals of the Program Renewal are to maintain the flow conveyance capacity of Valley Water flood protection facilities to reduce flood risks and ensure public safety, and to maintain the structural and functional integrity of Valley Water flood protection facilities and lands.

To meet these goals, the Program Renewal would prioritize and administer maintenance activities to achieve the following objectives:

- Remove the necessary sediment to provide flow conveyance and safety while maintaining habitat functions in creek systems;
- Manage vegetation to maintain access, flow conveyance, flood protection, and public safety in Valley Water's channels and right-of-way. Vegetation management is also

conducted to reduce fire fuel loads and wildfire risk and preserve the structural integrity of flood protection facilities. Vegetation management may also be conducted to promote overall ecological health, improve habitat for sensitive species, maintain restoration sites, and promote stewardship.;

- Manage vegetation to allow levee inspections and provide inspection visibility and access to maintenance work sites;
- Stabilize eroding stream and channel beds and banks to protect existing infrastructure, maintain public safety, reduce sediment loading, protect water quality and protect habitat values; and
- Avoid, minimize or mitigate impacts on the environment by identifying and prioritizing when maintenance work is necessary and incorporating stream stewardship measures to further reduce potential impacts and enhance ecologic function where possible.

The Program Renewal also seeks to obtain and maintain multi-year programmatic permits to regulate maintenance activities.

ES.2.2 PROGRAM BACKGROUND

Valley Water is responsible for water supply, flood protection, and stream stewardship in Santa Clara County, California. Valley Water generally performs routine maintenance work where it owns property in fee title, has an easement, or has maintenance obligations pursuant to effective rights of entry, licenses, and agreements. Valley Water flood protection facilities require maintenance to maintain the designed function of each facility. Historically, Valley Water has implemented these activities as needed. Therefore, the Program Renewal would be a continuation of past routine creek maintenance activities in most of the same areas using many of the same techniques. The difference between stream maintenance conducted before the SMP (pre-2002) and the initial SMP period (2002–2012) is the Program Renewal's comprehensive approach to managing and tracking the maintenance work and costs, monitoring environmental conditions, and providing program mitigation. The Program Renewal would be used by Valley Water staff to conduct routine stream maintenance practices in an efficient, consistent, and environmentally sensitive manner.

The requirements and policies of the original SMP document were finalized in 2002, when Valley Water completed CEQA review requirements and received authorizations from all the permitting agencies with jurisdiction over the program. Work under the first version of the SMP Manual (referred to as "SMP-1"), began in 2002, while work under the first subsequent SMP (referred to as "SMP-2"), began in 2012. In 2021, Valley Water initiated the third iteration of the SMP (the Program Renewal) to: (1) review SMP activities and revise the SMP Manual, (2) update its environmental compliance documentation, and (3) renew necessary SMP permits to guide the on-going program.

ES.2.3 PROGRAM RENEWAL AREA

The Program Renewal Area includes Santa Clara County below the 1,000-foot elevation contour in both the Santa Clara Valley basin and Pajaro River watershed. However, Valley Water does not work in all channels and creeks below the 1,000-foot contour but maintains a much smaller subset of channels and streams. Maintenance activities are generally limited to locations where Valley Water has land rights or has maintenance obligations pursuant to

effective licenses and agreements, approximately 333 miles of creeks and channels. **Figure ES-1**, below, provides a map of the Program Renewal Area.

Local governments within the Program Renewal Area in which Valley Water-owned or maintained channels exist include the cities of Campbell, Cupertino, Gilroy, Los Altos, Milpitas, Monte Sereno, Morgan Hill, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga, and Sunnyvale, and the towns of Los Altos Hills and Los Gatos, as well as the County of Santa Clara.

This page intentionally left blank.

Program Channel Types

Streams within the Program Renewal Area are generally classified by two types, as either a modified channel or an unmodified channel.

In the previous SMP-2 Manual and based on input received from regulatory agencies, Valley Water included a third channel type referred to as "Modified Channel with Ecological Value." Upon review, it became clear that additional channel designation created redundancy issues for work notification procedures, potential impact assessments, and other implementation tasks. Therefore, Valley Water has reverted the channel classifications to the original two types: modified or unmodified. Channels classified as modified channel with ecological value in the previous SMP-2 Manual are now classified as a modified channel. These two channel types are described in more detail in Chapter 2, "Project Description".

The Program Renewal would not cover maintenance activities at reservoirs, dams, pipelines outside of stream corridors, groundwater percolation facilities, in-stream summer dams, or work in stream reaches above the 1,000-foot elevation contour.

ES.3 PROGRAM DESCRIPTION

ES.3.1 OVERVIEW OF PROGRAM RENEWAL APPROACH

Based on the work performed during the 2012-2022 period, Valley Water has developed projections for work reasonably anticipated to occur over the duration of the Program Renewal (2027-2036). The estimated work projections identify the potential creek and maintenance activities by watershed. Although general maintenance needs have shown a relatively consistent pattern historically, projections of future stream maintenance activities are not intended to represent the exact extent or volume of work that may occur.

Actual stream maintenance activities vary from year-to-year, depending on weather and hydrologic conditions, frequency and extent of past maintenance activities, and budget/ funding availability. Future maintenance needs may occur, consistent with overall Program Renewal projections, but they may vary from the specific locations originally projected. Some maintenance activities, such as bank stabilization, cannot be reasonably projected because they happen in response to hydrologic events and a variety of site-specific factors.

Although the Program Renewal work projections provide an overview of expected maintenance needs over the period 2027–2036 (as described above), maintenance needs in any given year would reflect a variety of factors. Each year, Valley Water develops an annual work plan that identifies the locations, lengths, and areas for the given year's proposed maintenance activities. This information is then provided to overseeing regulatory agencies in an annual Notice of Proposed Work (NPW). Additional details about the NPW are provided below in the *Annual Work Cycle* section.

ES.3.2 ADAPTABILITY

As a program the SMP was designed and intended to be adaptable, and updated and modified over time as conditions require or improvements are found. One way the current renewal can improve the Program is by achieving the Program's maintenance goals together with identifying opportunities where more natural resources can be left undisturbed or enhanced.

As conditions allow and technologies and environmental regulations evolve, keeping the Program adaptable can lead to making changes in work activities to further reduce potential impacts.

In addition, annual post-maintenance meetings, or "lessons learned" meetings, are planned so that Valley Water and resource agencies' staff can evaluate the effectiveness of both the resource protection and the maintenance methods used. These evaluations would be used to update BMPs and SMP processes to create a greater understanding of how to accomplish environmentally sensitive and fiscally-sound maintenance work.

ES.3.3 MAINTENANCE ACTIVITIES

The Program Renewal involves six main categories of work activities, all of which were included in SMP-2: vegetation management, sediment removal, bank stabilization, downed tree management, management of animal conflicts, and minor maintenance. Descriptions of these maintenance activities are provided below, and additional details are provided in the SMP Manual Chapters 4-9 (Appendix A).

Vegetation Management

Vegetation management is conducted to maintain the hydraulic and operational functions of Valley Water's flood protection system channels; maintain access to Valley Water facilities; maintain the structural integrity of Valley Water flood protection facilities and lands; maintain defensible space around Valley Water's facilities and reduce fire fuel loads and wildfire risk; and improve overall public safety. In addition, vegetation management is conducted at restoration sites, to promote overall ecological health improvements in the Program Area through invasive plant management, corrective pruning, coppicing (i.e., the cutting of a woody plant to ground level), and other vegetation management activities. Vegetation management activities conducted routinely throughout the Program Area include pruning, vegetation and tree removal through both hand or mechanical means, herbicide application, mowing, coppicing, and grazing. Vegetation management also includes non-native invasive plant management, corrective pruning, and fuel reduction to improve the ecological health of Valley Water facilities and promote stewardship.

While not previously covered under SMP-2, as part of the Program Renewal, management of hazard trees (i.e., pruning, and removal) has been incorporated into the Program Renewal. Removal of hazard trees may be needed to ensure public safety along Valley Water channels, access roads and ramps. Hazard trees may include dead or dying trees, dead parts of live trees, or unstable live trees (due to structural defects or other factors) that are within striking distance of people or property (a target) and may cause injury or damage.

Valley Water's preference is to first thin or prune trees before considering tree removal. However, when tree removal is necessary based on a careful evaluation conducted by Valley Water staff, native trees are given a higher level of consideration for preservation than nonnative trees unless a public safety issue is present. Valley Water will compensate for tree removal where required within the riparian habitat (see Section 3.4, "Biological Resources," for a discussion on riparian tree removal). Chapter 4 of the SMP Manual (Appendix A) describes Valley Water's tree removal activities and considerations in detail.

Sediment Removal

Sediment removal is the act of mechanically removing excessive sediment that has deposited within a flood protection channel. Sediment removal is required when accumulated sediment reduces a channel's flow conveyance capacity, prevents facilities or appurtenant structures from functioning as intended, or impedes fish passage and access to fish ladders, and/or blocks access to Valley Water facilities. Sediment is removed to restore channel capacity and minimize the flood risk in accordance with the existing channel design (as available). Sediment removal under the Program Renewal does not include increasing a channel's cross-sectional area or capacity beyond the as-built channel design or maintenance baseline.

Sediment to be removed from Valley Water's channels and facilities would be assessed according to the Sediment Characterization Plan established for the SMP. Sediment characterizations would be conducted to determine the physical and chemical properties of the removed sediment using continuous core, discrete sampling, and residual sampling methods.

Collected sediment that meets wetland reuse criteria could be transferred to the South Bay Salt Pond Restoration Project or other environmental enhancement and restoration projects. Sediment that did not meet these standards but met standards for landfill disposal would be disposed at a local landfill. Sediment that exceeded hazardous waste criteria would be disposed at an appropriate hazardous waste facility (e.g., Kettleman Hills hazardous waste landfill). Valley Water may also dispose of sediment in upland reuse sites. Sediment from Program Renewal projects that is being reused will meet the sediment standards of the site where it is being reused.

While sediment removal is a projected work activity, the estimated projections may not reflect the actual maintenance work conducted. The annual sediment removal need varies yearly according to precipitation, hydrologic, and geomorphic conditions in the Program's channels and watersheds. Over the next 10-year Program Renewal period, estimated sediment removal activities include 58 miles of creeks or channels in the Program Renewal Area.

Valley Water will seek to establish new permanent mitigation areas (PMAs) within these sediment removal areas as part of the Program Renewal compensatory mitigation package.

Bank Stabilization

Stabilizing and repairing eroding stream channel banks, levees, and streambeds is a routine SMP activity. Based on the maintenance work conducted from 2014 to 2020, Valley Water stabilized a total of 1.7 miles of channel banks. This equates to an average of about 0.24 mile of channel bank or levee repairs per year. Although bank stabilization is routine and expected, the specific work locations are not certain until after each winter season. As a result, this type of maintenance (unlike sediment removal and vegetation management) is not a work activity with annual projections. Rather, bank stabilization maintenance needs are assessed annually on an as-needed basis. Mitigation for impacts of bank stabilization projects, if any, is also determined on an annual basis depending on the identified work need and potential resources affected.

The list of suitable SMP bank stabilization treatments has generally not changed since the last program update (SMP-2). These techniques are described in detail in the SMP Manual

(Appendix A). Site-specific conditions will help Valley Water determine which method is the most appropriate for the given situation. Valley Water favors the use of soft bank stabilization approaches that use softer bio-technological approaches and first considers these methods for use prior to consideration of more hardened techniques.

Downed Tree Management

Downed tree management refers to the management of downed or fallen trees and logs in Valley Water facilities. In some cases, downed trees may create a risk of flooding by causing debris to collect and block flows, or a risk of erosion by directing flows against channel banks or levees. There are also circumstances in which downed trees may function as a risk to public safety or a fire hazard, or in which downed trees block access to Valley Water facilities or make it impossible to properly inspect facilities. These and other situations can result in a need to relocate, modify, or remove downed trees. However, some downed trees may provide ecological function. Downed tree management therefore seeks to accommodate both the need to maintain Valley Water facilities and protect public safety and the ecological functions that downed trees may provide.

Downed trees in streams may provide specific benefits to salmonids. Downed trees located in streams that support salmonids and which meet the criteria of being below ordinary high water, being greater than 12 inches in diameter, and being greater than 6 feet in length are referred to as Large Woody Debris (LWD). Because of LWD's specific ecological value as a salmonid habitat feature, LWD management follows a particular set of procedures which are described in detail in the SMP Manual (Appendix A).

In the previous iteration of the SMP, LWD was described in its own chapter and other downed tree management was categorized under minor maintenance. The movement of these activities into the downed tree management category will allow Valley Water to manage downed trees in a more holistic and strategic manner. For more information regarding downed tree management, please see Chapter 9 of the SMP Manual (Appendix A).

Management of Animal Conflicts

Animals can damage Valley Water facilities by burrowing into levees or channel banks, foraging on revegetated mitigation sites, and/or interfering with Valley Water's work activities. To protect the structural integrity of Valley Water's facilities and to reduce conflicts with species living in sites where work is needed, maintenance work is conducted to repair Valley Water facilities damaged by animals.

Management of animal conflicts refers to the use of avoidance tactics, biological control, physical alterations, habitat modification, live trapping, and fumigation to reduce conflicts between Valley Water facilities and local species. Valley Water uses a range of approaches to maintain a safe work site environment, including the use of biological controls, levee compaction, filling burrows with soil or slurry, installing physical barriers like chain-link fencing above OHWM, and habitat modification through vegetation management, bird nest deterrence, nonlethal trapping, and fumigation.

As part of the Program Renewal, this category of work has been expanded to include bat exclusion activities within Valley Water's Upper Llagas Creek Flood Protection Project's high-

flow bypass tunnel. Bat exclusion measures may include installing one-way mesh exits that allow bats to leave but not return to the tunnel.

Minor Maintenance

Minor maintenance includes fence repairs, access road maintenance (such as grading, adding aggregate, and restoring contours), trash and debris removal, removal of small downed trees (not in a salmonid creek or less than 12 inches in diameter and less than 6 feet), minor sediment removal (25 cubic yards or less, limited to within 100 feet of structures such as outfalls, access ramps, flap gates, culverts, and bridges), ongoing maintenance of restoration sites (including irrigation systems), maintenance of structures like stream gauges, minor erosion repairs above OHWM (including grading small areas beyond the top of the bank to improve drainage and reduce erosion), and other minor maintenance activities needed to maintain Valley Water facilities. This category of work also includes in-kind replacement of structures within the same footprint (e.g., culverts, pipes, creeks-in-pipes, replacement of concrete linings, or similar structures), in-kind bank repairs (ensuring hardscape and softscape facilities are replaced with similar materials, respectively), and routine maintenance of fish ladders (e.g., removal of sediment, debris, or algal growth impairing functionality). Additionally, it includes removing obstructions, trash, and debris near structures (e.g., bridges, outfalls, tide gates, and streamflow measuring stations, within 100 feet upstream and downstream) to ensure proper functioning.

As part of the Program Renewal, the category of minor maintenance has been expanded to include trash boom maintenance, routine work at maintenance yards, floodwall maintenance (e.g., graffiti removal, addition of protective coatings, and periodic repairs to prevent erosion), maintenance of the Palo Alto Flood Basin tide gates (located at the confluence of Matadero Creek and Adobe Creek), maintenance of fish ladders that are not associated with a diversion, and maintenance of passive flood barriers (e.g., along Lower Penitencia Creek). For additional details about Valley Water's minor maintenance activities, see Chapter 8 of the SMP Manual (Appendix A).

Activities Not Covered in the Program Renewal

The Program Renewal would not include the following activities, which are therefore not analyzed in this DSEIR:

- Emergency[1] repair work;
- Maintenance work that would increase the flow conveyance or water supply capacity of a facility beyond the designed conveyance channel capacity (as-built design);
- Maintenance work in stream reaches that are above the 1,000-foot elevation contour;
- Maintenance work for dams, reservoirs, and other water supply facilities, such as canals, pipelines outside of stream corridors, groundwater percolation ponds, and instream summer dams (maintenance of these facilities will have environmental coverage outside of SMP-3);

[1] A situation is considered an "emergency" if it is a sudden, unexpected occurrence involving a clear and imminent danger that demands immediate action to prevent or mitigate loss of or damage to life, health, property, or essential public services (Public Resources Code Section 21060.3).

- Installation or major modification of fish ladders;
- Maintenance work conducted on private property by owners or other agencies (with the exception of urgent flood protection work described in Section 1.4.9 of the SMP Manual (See Appendix A);
- Maintenance work performed by other agencies; and
- Maintenance associated with capital improvement projects (CIPs) or large construction projects (e.g., projects outside the scope of SMP per-project limits) (see exceptions below).

For future CIPs, Valley Water would evaluate the construction and long-term operations and maintenance impacts in the environmental review documents. The CIP environmental review analysis may include a discussion of anticipated operations and maintenance activities that have already been mitigated under the SMP (where PMAs have been established). These PMAs are specific to the work location and channel cross section, work activity type, work acreage and scope of work. Permanently mitigated work activities and qualifying areas in future CIPs may be performed under the Program Renewal.

Long-term routine maintenance needs associated with CIPs will be evaluated for their potential coverage by the SMP. Valley Water will identify whether such activities would be covered under existing PMAs or would require additional mitigation. CIPs with maintenance activities not covered by the SMP would need to obtain separate authorizations.

ES.3.4 ANNUAL WORK CYCLE

SMP maintenance activities that are required to be reported through the Notice of Proposed Work (NPW) process occur on an annual cycle and generally occur in three phases. In the winter and early spring, maintenance needs are assessed and prioritized, the annual maintenance work plan is developed, and regulatory agencies would be notified through an NPW document submitted by Valley Water. During the summer and early fall, maintenance projects are implemented. Toward the end of the year and into the following winter, the Annual Summary Report (ASR) is developed, distributed to regulatory agencies, and Valley Water staff and managers typically meet with regulatory agencies to review the past year's work. These work phases are described in more detail below. Note that some SMP activities are not required to be reported through the NPW process.

Phase 1: Annual Maintenance Activity Identification and Development of NPW

During the winter and early spring, Valley Water staff would finalize its review of flood protection facilities and channels inspected to identify and prioritize maintenance needs. Maintenance work may be proposed either as part of the annual NPW or as identified throughout the year by individual Valley Water staff work orders. By April 15 of each year, Valley Water would notify the relevant regulatory agencies (i.e., those agencies with jurisdictional authority or oversight) of the year's planned maintenance projects. The relevant regulatory agencies would be provided with information describing proposed maintenance activities, locations, natural resource conditions, and any other key resource issues in the NPW. The NPW would describe which ground-disturbing maintenance activities would result in impacts on wetlands or waters of the U.S. and state as well as riparian habitat. The NPW also describes in detail Valley Water's proposal for providing compensatory mitigation for those impacts.

Some activities, such as most minor maintenance projects or opportunistic invasive plant removal projects, do not require advance notification through the NPW process. In these cases, appropriate resource protection measures and BMPs would be identified, and work would be allowed to proceed. In contrast, for other maintenance activities, a more detailed review process would occur and may include a site assessment and/or engineering evaluations. These activities would be reviewed to verify they were covered under the long-term regulatory clearances provided in conjunction with the Program Renewal. If the work was not covered by the Program Renewal, the appropriate project development process would be followed, and may include individual CEQA review and project-specific regulatory permits or clearances. For covered activities, appropriate resource protection measures and BMPs would be identified and added to the work order. For maintenance activities requiring compensatory mitigation, mitigation needs would be planned and described in the NPW. Pre-maintenance meetings would be held with appropriate Valley Water staff to discuss site-specific requirements, environmental constraints, and applicable BMPs. It may be necessary for Valley Water to submit a subsequent NPW in a given year, if late-season rains occur or other factors arise out of Valley Water's control.

Phase 2: Implementation of Program Renewal Activities

While some Program Renewal maintenance activities, such as certain minor maintenance, downed tree management, and vegetation management activities, may be conducted around the year in some circumstances, other Program Renewal maintenance activities would be implemented during the summer and fall season (as described in Chapter 2, *Project Description*). In addition, field monitoring of maintenance work (e.g., inspections of BMPs) would occur for both sediment removal and bank repair activities. Field monitoring would include inspections of BMPs so that they would be effective in preventing adverse impacts to water quality and stream habitats.

In general, sediment removal, instream vegetation removal involving ground disturbance, aquatic herbicide application, and bank stabilization work would be conducted between June 15 and October 15. If the fall season remains dry, work could continue until the first significant rainfall event and in accordance with the work windows outlined in Chapter 3 of the SMP Manual (Appendix A). A significant rainfall event is defined as local rainfall of 0.5 inch or greater within the watershed over a 24-hour period. Valley Water relies on weather forecasts to prepare for situations when significant rains are anticipated. In general, permits issued by regulatory agencies for the Program Renewal and/or mitigation requirements stemming from the CEQA analysis may also place additional limitations on work types and windows.

Phase 3: Annual Reporting with Regulatory Agencies

At the end of each year's maintenance season, an ASR would be developed and submitted to the appropriate regulatory agencies. This report would include a summary of the year's maintenance projects, describing what activities occurred and where, a description and confirmation of the restoration and mitigation activities implemented, and other SMP updates as necessary.

Following submittal of the ASR, regulatory agency staff would be invited to meet with Valley Water staff for an annual "lessons learned meeting" to be held in February or March of each year to evaluate the effectiveness of both resource protection and maintenance methods used in the preceding construction season. The information discussed at these annual lessons

learned meetings would be used to adaptively manage the BMPs and SMP processes to improve SMP effectiveness.

ES.4 PROGRAMMATIC IMPACT AVOIDANCE, MINIMIZATION, AND COMPENSATORY MITIGATION

The Program Renewal would incorporate the following overarching principles to protect natural resources and guide decision-making for stream maintenance activities and projects. Proposed program limits and BMPs (discussed in Chapter 2, *Project Description*) were developed to be consistent with these principles.

1. Avoid unnecessary intervention. Maintenance should only be done when it is determined to be necessary and appropriate to maintain conveyance, maintain the structural integrity of stream banks and beds, maintain access, protect public safety, or ecologically improve watershed ecosystems, streams, and/or other natural resources.

2. Consider the ecological system and its processes, including adjacent land uses, when determining maintenance necessity. If maintenance is necessary, then, before selecting sediment, vegetation or bank stabilization treatments, work to understand the channel system and its formative processes to know why the reach is functioning as it is. Established maintenance guidelines (MGs) are a method to document and centralize applicable information to be used to guide appropriate maintenance activities. Where channels are bordered by developed land uses, flood protection requirements may limit stream maintenance options. Maintenance activities will not increase the level of flood protection provided to surrounding lands as defined by as-built information for the reach, or increase the dimensions of an unmodified channel.

3. Seek maintenance solutions that minimize impacts on the environment. Implementing BMPs, work windows, work activity program requirements, Program Renewal limits, and incorporating geomorphic approaches when possible, can assist in minimizing impacts.

4. Integrate maintenance activities towards sustainability to reduce frequency of maintenance.

ES.4.1 AVOIDANCE OF SERPENTINE HABITATS AND PAYMENT OF NITROGEN DEPOSITION FEES

Sensitive serpentine-associated plant and animal communities exist in the Program Renewal Area along the Santa Clara Valley floor and foothills. These habitats support unique plant species, including serpentine-associated special-status species. To protect these ecosystems, Program Renewal activities will avoid maintenance in sensitive serpentine areas.

Since no direct impacts on serpentine habitats are expected, compliance with Valley Habitat Plan (VHP) conditions and impact fees for serpentine land cover types will not be required. However, due to the ecological sensitivity of these habitats and the rarity of special-status plants, Valley Water will mitigate potential residual impacts by paying VHP nitrogen deposition fees. These fees, through the Santa Clara Valley Habitat Agency's Voluntary Fee Payments Policy, address nitrogen emissions from maintenance vehicles and equipment. Further details on this mitigation measure can be found in Section 3.4, "Biological Resources."

ES.4.2 PROGRAM LIMITS AND BEST MANAGEMENT PRACTICES

In effort to minimize impacts resulting from maintenance activities, the Program Renewal includes the following limits:

- Coppicing would be limited such that no more than 20 percent overstory canopy removal is allowed in any stream reach, and at least 50 percent of the understory canopy of native vegetation would be retained.
- Removal of nonhazard trees 6-12 inches diameter at breast height (dbh) would be limited to 2,000 live trees between 2027 and 2036. On an annual basis, this work would be limited to 400 live tree removals per year. For each project, the Program Renewal would allow no more than 20 percent overstory canopy removal in any reach, and at least 50 percent of the understory canopy of native vegetation would be retained.
- Removal of nonhazard trees greater than 12 inches dbh would be limited to 150 live trees between 2027-2036. On an annual basis, this work would be limited to 20 live tree removals per year. For each project, no more than 20 percent overstory canopy removal would be allowed in any reach, and at least 50 percent of the understory canopy of native vegetation would be retained. Removal of trees greater than 12 inches dbh is a new activity under the Program Renewal that was not included in SMP-2.
- The Program Renewal's in-channel and non-in-channel herbicide application limits are based on gallons/pounds of product and are summarized in **Tables 2-7** and **2-8** in Chapter 2, *Project Description*. The per project limits would correspond to the product label restrictions per application.
- There is no limit to the number of sediment removal projects that may occur each year; however, a separation of 500 feet between sediment removal work sites is required and each project must comply with the quantitative objectives established by the MGs (where developed). Sediment removal in modified channels shall not exceed 5,000 linear feet for individual projects. Sediment removal in unmodified channels must be associated with a facility or human-made structure (i.e., bridge, outfall, gauge, or grade control) and shall not exceed 300 linear feet for individual projects. Valley Water may submit waiver requests for sediment removal projects that exceed the per-project limits; such requests must be reviewed and approved by appropriate regulatory agencies before commencing work.
- There is no limit to the total number of bank stabilization projects that may occur in a single year. The annual bank stabilization limit is one linear mile of channel; however, hardscape areas that are replaced with softscape or hybrid methods may exceed the per-project limits and will not be counted toward the annual maximum one-mile limit. In-kind bank stabilization projects will not be counted toward the annual maximum one-mile limit. A separation of 250 feet between bank stabilization repair sites is also required to ensure that each repair has independent utility. Valley Water may submit waiver requests for bank stabilization projects that exceed the per-project limits; such requests must be reviewed and approved by appropriate regulatory agencies before commencing work.
- For downed tree management activities in channels supporting anadromous salmonids, up to 200 cubic yards of large woody debris (LWD) cutting and removal work would be allowed during the 2027-2036 period. This 10-year limit does not apply to downed tree removal activities required for fish passage or those associated with removal of debris jams/trash rafts as these efforts would result in a water quality benefit.

- Animal conflict management activities involving surface compaction and filling of burrows above OHWM will not exceed 42 linear miles during the 2027-2036 period.
- For minor maintenance activities, individual projects shall not exceed 0.08 acre of wetland/riparian vegetation impacts. Project reporting is required for minor maintenance projects that result in 0.01 acre or more of wetland/riparian vegetation impacts or any activity where dewatering is performed. The annual limit for minor maintenance projects is 0.5 acre of wetland/riparian vegetation impacts. The 5-year program limit is 2 acres of wetland/riparian vegetation impacts, and the 10-year program limit is 4 acres of wetland/riparian vegetation impacts.

In addition to the above-described program limits, Valley Water implements BMPs, which include standard practices and impact avoidance measures that would minimize potential environmental impacts. BMPs presented in **Table 2-10** of Chapter 2 are also included in the SMP Manual (Appendix A). These measures are implemented prior to, during, and post maintenance operations.

BMPs are implemented to avoid or minimize impacts to water quality and include measures and procedures to identify site or maintenance constraints, such as biological or cultural resource surveys. They protect and enhance existing habitat, protect maintenance workers and the public from equipment hazards, and provide specific and detailed guidance on vegetation management procedures, sediment removal activities, and bank stabilization techniques implemented by Valley Water. BMPs also include procedures for animal management activities and application of pesticides.

ES.4.3 COMPENSATORY MITIGATION

The Program Renewal includes many impact avoidance and minimization approaches and measures that have been developed, implemented, and revised since the SMP was initiated in 2001. Additionally, the SMP includes several BMPs, specifically targeted to the Program's maintenance work activities to further avoid or minimize potential impacts. However, in instances where impact avoidance and minimization measures on their own are not adequate to offset potential Program impacts, the SMP includes a compensatory mitigation approach which builds on the 25-year history of providing compensatory mitigation as part of Valley Water's SMP. Valley Water provides on-going compensatory mitigation activities as part of the routine operation and implementation of the SMP. The compensatory mitigation approach is summarized in this section to provide a general understanding and context on how Valley Water's on-going mitigation activities were considered during the evaluation of potential Program impacts and the development of CEQA mitigation measures within this DSEIR. The following paragraphs briefly describe the compensatory mitigation approaches used during SMP-1 and SMP-2, and the updated approach for the Program Renewal planning period.

Background on SMP-1 and SMP-2 Mitigation Approaches

Under SMP-1, Valley Water established PMAs for certain in-channel maintenance activities to offset impacts to wetlands and waters of the U.S./state. Specifically, PMAs were established for sediment removal, removal of vegetation less than 6 inches dbh, and in-channel herbicide application activities conducted during SMP-1. Where PMAs were established, those specific activities were mitigated for in perpetuity. In addition, where sediment removal PMAs were established during the SMP-1 period, future impacts to vegetation less than 6 inches dbh and

wetlands on the sediment within the same sediment removal footprints were also permanently mitigated for. During the SMP-1 planning period (2002-2011), Valley Water mitigated work activities in perpetuity through a combination of land acquisition, habitat protection and wetland restoration/creation activities. SMP-1 mitigation projects are summarized in the Program Renewal Manual (Appendix A).

Under SMP-2 (2011-2022), Valley Water adjusted its approach to include more on-site and off-site mitigation activities based on annual work needs in addition to seeking additional PMAs. Under the SMP-2 approach, Valley Water provided and continues to provide compensatory mitigation for impacts to wetlands/other waters on an annual basis using the following three approaches:

1. **On-site and Off-site Ecologic Services-based Mitigation**: This included invasive plant management, native plant revegetation, removal of trash and pollutants from encampment activities, concrete removal, and rehabilitation of encampment-related excavated banks.

2. **Land-acquisition-Based Mitigation**: This included using remaining credit from completed SMP-1 mitigation projects and creation of new land acquisition-based projects.

3. **Species-specific Mitigation**: This approach included gravel augmentation and building instream complexity features.

Toward the latter half of the SMP-2 period (2019-2022), Valley Water moved toward a strategy of prioritizing multi-benefit mitigation sites. For example, along Calera Creek, Valley Water conducted sediment removal over a large area to make sure there was capacity in the reach to allow long term vegetation establishment, removed some existing large invasive trees, and installed a large revegetation site. Valley Water also implemented a mitigation project on Saratoga Creek which included a combination of rehabilitating a bank that had been altered by others through compaction and construction of dirt bike ramps, trash removal and removal of concrete fragments in the channel.

During SMP-2, Valley Water primarily mitigated for impacts to salmonid habitat features through the construction of projects that installed LWD, gravel, and/or instream complexity features in the same watershed. Valley Water also constructed one fish passage improvement project on Stevens Creek at Evelyn Avenue. However, this project was not successful and therefore the mitigation was not applied to any SMP-2 impacts.

Program Renewal Mitigation Approach

For the Program Renewal, Valley Water proposes a strategy that includes a return to the overall focus toward establishing permanent mitigation for impacts to wetlands and waters of the U.S./state via the establishment of new PMAs. Because the existing SMP-1 PMAs provide permanent mitigation, no additional mitigation is required along reaches where PMAs for maintenance activities have already been established.

To determine future mitigation needs, Valley Water will quantify Program impacts on biological resources, such as the acreage of impacts to wetlands and riparian habitats, sensitive communities, and special-status species' habitats, on an annual basis as work is performed from 2027–2036. Valley Water will tally the impacts of Program activities for a

specific year at the end of each year. These impact calculations will then be used as the basis for determining mitigation to be provided at either that year's end or the following year. This annual analysis will clearly distinguish where activities occurred (e.g., in a PMA versus in new areas for which mitigation is required).

Valley Water will establish new PMAs for Program Renewal maintenance activities that result in permanent impacts to wetlands and waters of the U.S./state for: (1) different maintenance activities occurring along reaches that have existing activity-specific PMAs, and (2) any maintenance activities occurring along reaches without any existing PMAs (including new channel areas incorporated into the program). The goal is that, over time, Valley Water will establish PMAs along channels that are likely to require ongoing vegetation removal below top of bank and/or sediment removal. Under the Program Renewal, Valley Water will create new PMAs in areas outside existing PMAs.

PMA mitigation opportunities would create, establish, and/or provide suitable mitigation to address permanent impacts associated with annual repeated maintenance activities. Opportunities to provide suitable and high-quality mitigation to address the potential impacts to the channel's functions and values could occur through restoring existing Valley Water habitats or restoring or improving other watershed lands, or non-Valley Water maintained creeks, or other natural resources. Mitigation would be provided in perpetuity as it was for PMAs established during SMP-1.

Although this approach is similar to the PMA approach in SMP-1, the Program Renewal would develop additional PMAs that would target a smaller subset of high priority channels that require repeated annual maintenance and do not currently have PMA status.

The Program Renewal mitigation approach also plans to use remaining and available mitigation credit from mitigation projects established during SMP-1 to mitigate for new permanent impacts (i.e., Island Ponds, Pajaro Freshwater Wetland, and Landings project). Additionally, the Program Renewal mitigation approach would rely on the VHP, which is currently being amended[2] and expected to be considered for approval in 2026, and the associated VHP In Lieu Fee (ILF) Program. The ILF Program is used to compensate for unavoidable impacts on Waters of the U.S. and Waters of the State and federally-listed anadromous fish. Specifically, the Program Renewal would comply with VHP conditions, pay impact fees in accordance with the types and acreage of habitat, and implement VHP-specified conservation measures. Obtaining potential coverage under the VHP could be a component of the proposed mitigation package, provided that the VHP's ILF program would make enough credits available for Valley Water to purchase to be able to compensate for Program Renewal impacts to regulated habitats and VHP-covered species. Incidental take approval for VHP-covered federally listed species will be provided via the VHP for VHP-covered activities and species. Where take of state- or federally-listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, endangered species consultations will continue to occur on an as-needed basis.

Before the VHP is amended, if residual impacts from maintenance activities remain significant under CEQA with the implementation of Valley Water's BMPs, Valley Water will

[2] The VHP amendment includes the addition of new covered species, updates to the conservation strategy, adding the Program Renewal as a covered activity, expanding the VHP area boundary, and more.

provide compensatory mitigation for impacts on biological resources, as discussed in Section 3.4.4, "Impact Analysis" under Mitigation Approach.

Except for using remaining mitigation from mitigation projects established during SMP-1, it may be several years before Valley Water is able to fully implement these mitigation options due to the large scale of some of the mitigation projects and the time involved for completing the plan design and the permitting process for the projects. Accordingly, similar to the SMP-2 approach, providing mitigation on an annual basis for Program Renewal maintenance activities will likely be necessary while these longer-term approaches are developed. Valley Water's proposed approach for providing mitigation on an annual basis would be met through the following: (1) encampment cleanup and bank rehabilitation, (2) a grant program to fund projects by local watershed groups and homeless community services, and (3) trash removal and additional mitigation options. These options are described in the subsections below and incorporated into some of the EIR mitigation measures in Section 3.4, "Biological Resources." Additional compensatory mitigation for impacts to sensitive species are described in Section 3.4, "Biological Resources.

To address impacts on the riparian corridor, Valley Water may develop reach characterization sheets for areas where frequent maintenance activities are projected to occur in the next 10-year Program Renewal periods. These characterization sheets would be utilized to describe biological resources, water quality conditions, and overall ecological function within a channel reach; ongoing and future maintenance needs; and whether potential restoration opportunities exist within a reach. The characterization sheets may also be used to identify and map large trees with high importance and ecological value and describe potential opportunities for enhancing these trees. Reach characterizations could include descriptions of methods for maintaining individual reaches in a manner that has a neutral or positive effect on the reach's habitat function, therefore avoiding a need for separate compensatory mitigation.

Encampment Clean-up and Bank Rehabilitation

In recent years, Valley Water has observed a dramatic increase in encampment-generated, trash, debris, hazardous pollutants, and encampment-caused wildfires on Valley Water-managed creeks, channels, and lands. Collectively, the removal of riparian vegetation (both intentionally during creation and "maintenance" of encampments and unintentionally because of dumping of trash and trampling) and the abundance of trash are perhaps the most readily noticeable environmental issues in creeks throughout many of the urban and suburban areas of Santa Clara County. The growth of encampments and trash have led to increased and substantial water quality and habitat impacts to the region's streams and flood protection channels. Fires originating at encampments have also resulted in the loss of extensive riparian habitat.

Valley Water may conduct encampment cleanup activities to compensate for habitat impacts. Encampment cleanup includes removing human-caused inorganic trash that is in, or positioned to enter, aquatic and riparian habitats. This would provide mitigation for impacts associated with vegetation management, sediment removal, and bank stabilization activities. Chapter 10 the SMP Manual (Appendix A) discusses proposed mitigation ratios for each impact type.

Valley Water may also repair and rehabilitate stream banks and floodplains impacted by encampment-related excavation as mitigation for temporary or permanent bank stabilization impacts.

Grant Program to Fund Projects by Local Watershed Groups and Support Homeless Community Services

Valley Water is also considering developing a local grant or partnership program to help fund and implement watershed improvement projects led by local nonprofit agencies and Resource Conservation Districts (RCDs) and to help fund unhoused community services. Such a program may annually fund mitigation projects that are directly tied to the specific activities resulting in water quality impacts under the Program Renewal. Example projects that this program may support include habitat restoration, erosion control, and water quality improvement projects in the Program Renewal Area. Chapter 10 the SMP Manual (Appendix A) discusses proposed mitigation ratios for each impact type.

In addition, because the abundance of trash is one of the primary water quality issues in northern Santa Clara County's creeks, much of which is associated with unauthorized encampments, the grant program may also provide financial support to unhoused community services. Such services may include housing, employment, vocational services, mental health and recovery programs, and other related support services. By supporting such services, Valley Water would indirectly improve creek water quality by helping the unhoused community find more permanent housing solutions and move the unauthorized encampments out of Valley Water's creeks. Water quality would be improved due to the removal of trash, debris, and hazardous pollutants. There would be less obstructions to fish passage, and there would be less damage to fish and wildlife habitats.

Trash Removal

Trash removal work that occurs outside of encampment clean-up activities may serve as mitigation for vegetation removal and sediment removal activities that would result in impacts to wetlands/other waters of the U.S./state. Removing trash helps improve water quality and aquatic habitat for plant and terrestrial species. Chapter 10 the SMP Manual (Appendix A) discusses proposed mitigation ratios for each impact type.

Additional Mitigation Options

In addition to the annual mitigation approaches described above, this section describes additional mitigation options that may be implemented on an annual basis for Program Renewal activities. These measures are incorporated into some of the EIR mitigation measures in Section 3.4, "Biological Resources." These options may be implemented in addition to PMAs and the payment of VHP fees (if/when the VHP amendment is adopted) for the duration of the 10-year Program Renewal period, to allow flexibility. See Chapter 10 of the SMP Manual (Appendix A) and the Mitigation Monitoring and Reporting Program (MMRP) for additional details.

- **Revegetation**. As in SMP-2, this involves conducting revegetation activities to compensate for the loss of quality and quantity of riparian habitat resulting from SMP impacts. A typical planting palette, plant list, and proposed mitigation ratios are described in the SMP Manual (Appendix A).

- **Concrete Removal**. The removal of concrete would expand wetlands and/or waters of the U.S./state and will enhance riverine functions. This would provide mitigation for bank stabilization activities resulting in permanent impacts on wetlands/waters of the U.S./state.
- **Fishery Restoration Projects**. Valley Water envisions constructing one or more large mitigation project(s) that involve restoration of salmonid habitat through passage improvement; installation of habitat features such as LWD, gravel, and instream complexity; or other methods to improve streams' function as salmonid habitat. This type of mitigation project would provide mitigation for downed tree management work involving removal of LWD in anadromous salmonid creeks and/or impacts to salmonid habitat features associated with bank stabilization and sediment removal projects in salmonid creeks. The Coyote 10B, Stevens Creek Evelyn Avenue Fish Passage, and Pickell's Dam Removal mitigation projects are examples of projects that restore salmonid habitat.
- **VHP Impact Fees and ILF Program**. Even if the Program Renewal would not be covered under the VHP during the initial years of the Program Renewal period, paying VHP fees would be appropriate to mitigate Program Renewal impacts to VHP-covered species because these fees would directly benefit covered species in the South Bay region. This mitigation approach is consistent with the Habitat Agency's Voluntary Fee Payments Policy. In the event that Valley Water needs to remove large invasive trees in VHP-covered areas and depending on the habitat value provided by such trees, Valley Water may also pay VHP impact fees for the acreage of land cover that is modified by invasive tree removal activities. For removal of noninvasive trees greater than 6 inches dbh, tree planting and/or payment of VHP impact fees would provide mitigation for tree removals. Purchase of ILF credits would provide mitigation for impacts to waters of the U.S./state and compensate for Program Renewal impacts to regulated habitats in addition to VHP-covered species. Where take of state- or federally-listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, endangered species consultations will continue to occur on an as-needed basis.
- ~~**Reach Characterizations.** To address impacts on the riparian corridor, Valley Water may develop reach characterization sheets for areas where frequent maintenance activities are projected to occur in the next 10-year Program Renewal periods. These characterization sheets would be utilized to describe biological resources, water quality conditions, and overall ecological function within a channel reach; ongoing and future maintenance needs; and whether potential restoration opportunities exist within a reach. The characterization sheets may also be used to identify and map large trees with high importance and ecological value and describe potential opportunities for enhancing these trees. Reach characterizations could include descriptions of methods for maintaining individual reaches in a manner that has a neutral or positive effect on the reach's habitat function, therefore avoiding a need for separate compensatory mitigation.~~
- **Post-Wildfire Recovery.** In situations where a large and destructive riparian wildfire occurs, Valley Water may propose restoration of ecosystem function following a wildfire as a mitigation option. Valley Water would submit the wildfire recovery plan as part of the NPW process and include a description of the mitigation proposal. Activities may include but are not limited to revegetation and hydroseeding to reduce erosion, invasive plant species control, road repair, and removing critical safety hazards (dead or dying trees) to promote and support habitat for animal and plant species. The plan will also describe success criteria, monitoring processes, and site maintenance.

ES.5 PERMITS, APPROVALS AND CONSULTATION REQUIREMENTS

Several federal and state regulatory agencies granted permits, approvals, and permit extensions to Valley Water to implement SMP-2 (for the 20134-2023 period), some of which expired in 2023 and 2024. Specifically, permits from the U.S. Army Corps of Engineers (USACE), Central Coast Regional Water Quality Control Board (CC RWQCB), and California Department of Fish and Wildlife (CDFW) expired on December 31, 2023. The biological opinion from National Marine Fisheries Services (NMFS) expired on April 8, 2024 and the biological opinion from U.S. Fish and Wildlife Service (USFWS) expired on April 15, 2024. The permit from the San Francisco Bay Conservation and Development Commission (BCDC) expires on April 30, 2026. The SF Bay RWQCB Section 401 Water Quality Certification did not include an expiration date and will be valid until the SF Bay RWQCB issues a new Order.

The same above-described agencies (with the exception of the SF Bay RWQCB) were asked to issue new or amended multi-year permits and approvals to authorize Valley Water to continue implementing the SMP between 2027 and 2036.

- USFWS confirmed that the change in expiration date did not change the effects analysis of jeopardy determination of their Biological Opinion and communicated that USACE can still request SMP projects to be appended to their Biological Opinion as needed (Griego 2022).
- USACE reinitiated consultation with NMFS on May 3, 2023, and NMFS prepared a Biological Opinion for a 3-year extension that is valid until December 31, 2026. USACE issued an extension of Regional General Permit 17 to December 31, 2026. Purchase of ILF credits would provide mitigation for impacts to waters of the U.S./state and compensate for Program Renewal impacts to regulated habitats in addition to VHP-covered species.
- Where take of federally-listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, endangered species consultations will continue to occur on an as-needed basis. Where take of state -listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, incidental take coverage would be provided via Incidental Take Permits from CDFW, on an as-needed basis.
- CDFW extended the Lake and Streambed Alteration Agreement to December 31, 2028. This LSAA was amended in September of 2024 to include explicit coverage of concrete removal mitigation items and salmonid habitat feature mitigation items in the Pajaro watershed, which had been described in the SMP-2 Manual, but not explicitly described in the LSAA.
- The CCRWQCB extended the Section 401 Water Quality Certification to December 31, 2026.
- BCDC granted an amendment that will expire on April 30, 2026, and Valley Water has applied for an extension through December 2026.

As CEQA responsible agencies, the state permitting agencies will utilize this SEIR (once it is certified) as the CEQA compliance document in issuing new permits once the extensions and amendments expire. If applicable, the USACE will use this SEIR as background information for Section 404 permit NEPA compliance, and the USFWS and NMFS will use this SEIR as background information for Section 7 consultation with the USACE once the extensions

expire. In addition to the permits and approvals mentioned above, state and local agencies would issue encroachment permits as needed to implement Program Renewal maintenance activities.

ES.6 PUBLIC INVOLVEMENT PROCESS

ES.6.1 SCOPING COMMENT PERIOD AND MEETING

In accordance with CEQA Guidelines (Section 15375), Valley Water circulated a Notice of Preparation (NOP) of a DSEIR for the Program Renewal on May 27, 2022 (**Appendix B**). The NOP for the Program Renewal was circulated to the public; to local, state, and federal agencies; and to other interested parties. The purpose of the NOP was to inform responsible agencies, trustee agencies, and the public that the Program Renewal could have significant effects on the environment and to solicit their comments. Comments received in response to the NOP were considered during preparation of this DSEIR (Appendix B).

To provide the public, as well as responsible and trustee agencies, an opportunity to ask questions and submit comments on the SMP and the scope of the DSEIR, Valley Water held a public scoping meeting on June 16, 2022, at 5:45 p.m. at the Valley Water Headquarters Building Boardroom and via Zoom during the public scoping period. As described above, notices of the meeting were mailed to interested parties; in addition, scoping meeting information was published prior to the event on Valley Water's website:

https://www.valleywater.org/project-updates/stream-maintenance-program

Valley Water accepted verbal and written comments at the scoping meeting and accepted both written and electronic comments (via email) during the 30-day scoping period. During the scoping period, nine comment letters were received. These comments were considered in preparing this DSEIR and are summarized in Appendix B.

ES.6.2 PUBLIC AND AGENCY REVIEW OF THE DSEIR

This document is being circulated to local, state, and federal agencies and to interested organizations and individuals who may wish to review and comment on the report. Valley Water published a Notice of Availability of the Draft EIR on July 21, 2025, which marked the beginning of a 45-day public review period. Written comments or questions concerning this DSEIR should be directed to the name and address listed below. Submittal of written comments via e-mail (Microsoft Word format) will be greatly appreciated.

Santa Clara Valley Water District
Attention: Billy Williams
5750 Almaden Expressway
San Jose, CA 95118-3686
E-mail: bwilliams@valleywater.org
Subject Line: SMP Update EIR Comments

The DSEIR and appendices can be reviewed on any Valley Water business day between the hours of 8:00 a.m. and 5:00 p.m. Monday through Friday at Valley Water headquarters,

located at the address shown above, or on the Valley Water Web site at [https://www.valleywater.org/project-updates/stream-maintenance-program]. The DSEIR also will be available at the libraries listed below during their normal operating hours:

- Dr. Martin Luther King, Jr. Library; 150 E. San Fernando St.; San Jose, CA 95112
- Morgan Hill Public Library; 660 W. Main Ave.; Morgan Hill, CA 95037
- Palo Alto (Rinconada) Public Library; 1213 Newell Rd.; Palo Alto, CA 94303
- Cupertino Public Library; 10800 Torre Avenue; Cupertino, CA 95014-3207
- Milpitas Public Library; 160 N. Main Street; Milpitas, California 95035

ES.6.3 PREPARATION OF FSEIR AND PROJECT APPROVAL

Written and oral comments received in response to the DSEIR will be addressed in a Final Subsequent Environmental Impact Report (FSEIR), which will include all comments received, responses to each, and a reprint of the DSEIR, updated as appropriate in underline/~~strikeout~~ in response to the comments. After review of the FSEIR, Valley Water staff will recommend to the Valley Water Board of Directors whether to approve or deny the Program Renewal. The Board then will review the FSEIR, consider staff recommendations and public testimony, and decide whether to certify the FSEIR and approve or deny the Program Renewal.

If the Board approves the Program Renewal in spite of significant impacts identified by the FSEIR that cannot be mitigated, the Board must state in writing the reasons for its actions in a Statement of Overriding Considerations (Section Guidelines 15093[c]).

ES.7 AREAS OF KNOWN CONTROVERSY

CEQA Guidelines Section 15123 states that an EIR must identify areas of known controversy that might have been raised by other agencies, the public, or other stakeholders. Areas of communicated controversy related to the EIR identified in the EIR scoping process include, but are not limited to, the following:

- The need to comply with Assembly Bill 52, ensuring tribal cultural resources are considered, consulting with California Native American tribes, and conducting archaeological surveys if necessary.
- Potential construction impacts in Caltrans Right-of-Way (ROW), including noise, stream flow changes, and required mitigation measures.
- Ensuring ADA compliance for affected facilities, maintaining pedestrian and bicycle access, and securing encroachment permits for work within Caltrans ROW.
- Conducting hazardous materials surveys before demolishing buildings or structures, addressing lead-based paint, mercury, asbestos, and PCB caulk, and ensuring proper disposal in accordance with state regulations.
- Sampling imported soil or backfill to verify it is free from contamination.
- Confirming project activities within the County Habitat Conservation Plan Area comply with the County Planning Office geobrowser or Habitat Agency requirements.
- Providing notification before removing trees from County-owned land or within County ROWs.

- Evaluating direct and indirect impacts on waterbodies due to Program Renewal activities, ensuring protection of habitats, fish migration, and rare species.
- Providing a detailed project description in the SDEIR, including anticipated work frequency, crew sizes, construction schedule, lighting, noise, and traffic generation, to enable CDFW to assess potential environmental effects.
- Documenting discussions among Valley Water, CDFW, and other agencies on incorporating the program into the Santa Clara Valley Habitat Plan (HCP/NCCP), detailing proposed activities, affected land cover types, impact frequency, and mitigation measures.
- Clarifying the timeline for the Program Renewal in the SDEIR, addressing potential gaps in coverage.
- Identifying potential impacts on special-status species and outlining necessary mitigation measures, including habitat assessments, plant and wildlife surveys, species avoidance protocols, and required state or federal consultations.
- Addressing cumulative impacts from foreseeable future projects, assessing the significance of each impact, and ensuring habitat protection for special-status species.
- Considering actions to identify and mitigate encampments for the unhoused while preventing environmental degradation from human habitation.

These comments are addressed in the relevant resource topic sections of the analysis in Chapter 3, with NOP Response letters available in **Appendix B**.

ES.8 ISSUES TO BE RESOLVED

CEQA Guidelines Section 15123 calls for the lead agency to disclose issues to be resolved. Issues to be resolved for this DSEIR include the choice among alternatives and how to mitigate significant effects.

ES.9 SUMMARY OF IMPACTS

The impacts of the Program Renewal, proposed mitigation, and significance conclusions are discussed in detail in Chapter 3, *Environmental Setting and Impact Analysis,* and Chapter 4, *Other Statutory Considerations,* of this DSEIR. Table ES-1 at the end of this chapter summarizes the impacts, mitigation measures, and levels of significance identified in this document.

Environmental resources potentially affected by the Program Renewal include the following:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural and Paleontological Resources
- Energy
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Geomorphology
- Noise
- Public Services and Utilities
- Traffic and Transportation
- Tribal Cultural Resources
- Water Quality
- Wildfire

ES.9.1 SIGNIFICANT AND UNAVOIDABLE IMPACTS

The following impacts have been identified as significant and unavoidable:

- Impact BIO-4: Interfere with the Movement of Any Native Resident, Migratory Species, Migratory Wildlife Corridors, or the Use of Native Wildlife Nursery Sites.
- Impact NZ-1: Temporary Exposure of the Public to Noise Levels in Excess of City or County Standards
- Impact NZ-2~~3~~: Generate Excessive Ground Vibration or Ground-borne Noise Levels.
- Cumulative Impact BIO-4: Cumulative Impacts on Movement of Any Native Resident or Migratory Species or Established Wildlife Corridors, or on Use of Native Wildlife Nursery Sites
- Cumulative Impact NZ-1: Cumulative Impacts from Substantial Temporary or Permanent Increase in Ambient Noise Levels or Substantial Incremental Increase in Noise Levels
- Cumulative Impact NZ-2: Cumulative Impacts from Ground Vibration or Ground-borne Noise Levels

ES.10 ALTERNATIVES CONSIDERED

Chapter 5 of this DSEIR, *Alternatives Analysis*, describes the alternatives considered in detail as well as alternatives considered but dismissed from further analysis. The purpose of the alternatives analysis in an EIR is to describe a range of reasonable alternatives to the proposed project that could feasibly attain most of the objectives of the proposed project while reducing or eliminating one or more of the proposed project's significant effects. The range of alternatives considered must include those that offer substantial environmental

advantages over the proposed project and may be feasibly accomplished in a successful manner considering economic, environmental, social, technological, and legal factors.

The following alternatives have been evaluated for their feasibility and their ability to achieve most of the Program Renewal objectives while avoiding, reducing, or minimizing significant impacts identified for the Program Renewal:

- No Project Alternative
- Reduced Frequency Alternative
- Limited Work in Unmodified Channels Alternative
- Limited Activities Alternative

ES.10.1 NO PROJECT ALTERNATIVE

Under the No Project Alternative, Valley Water would pursue one of two options: (1) continue conducting maintenance activities, including CEQA compliance and project-by-project permitting on an annual basis, following practices under the existing SMP (SMP-2); or (2) seek to extend or renew existing SMP programmatic permits, following practices under the existing SMP and utilizing previous CEQA documentation. Valley Water would continue conducting the same maintenance activities under the existing SMP, using existing operations and maintenance guidelines and BMPs.

As described in Chapter 2, *Project Description*, some primary differences between this alternative and the Program Renewal are that the Program Renewal would include hazard tree management, the removal of trees greater than 12 inches dbh, additional minor maintenance work[3], updated work limits, and refinements to BMPs to reflect updated regulations and improved clarity. If project-by-project permitting was conducted under this alternative, the added maintenance activities, updated work limits and BMP modifications would be added on a project-by-project basis, as dictated by mitigation contained in CEQA compliance documents and the terms contained in annually renewed permits. The No Project Alternative could require Valley Water to conduct CEQA compliance and obtain permits on an annual basis, requiring more time and effort annually compared to the Program Renewal.

Because of the lead time needed to obtain regulatory permits, some needed maintenance likely would not be conducted during the same season in which the need for it was identified, resulting in the potential for failure to stabilize eroding stream and channel beds, maintain the design flow or provide appropriate conveyance capacity of facilities, consequently not meeting the Program's objectives. Therefore, it is likely that less maintenance work would be accomplished each year. If less sediment removal were to occur, sediment removal activities (such as truck trips for hauling and disposal/reuse) also would be reduced; however, the Program may fail to remove enough sediment to maintain flow conveyance and safety and therefore may not achieve the Program Renewal's objectives. If less vegetation management

[3] New minor activities that will be included in the Program Renewal include trash boom maintenance, routine work at maintenance yards, floodwall maintenance (e.g., graffiti removal, addition of protective coatings, and periodic repairs to prevent erosion), maintenance of Palo Alto Flood Basin tide gates, maintenance of fish ladders that are not associated with a diversion, and maintenance of passive flood barriers.

occurred, adequate flow conveyance through the channels could be compromised as well as public safety due to more of a possibility of flooding and wildfire risk. Additionally, under this alternative over the 10-year planning horizon (2027-2036), annual environmental compliance costs required for the No Project Alternative would be expected to be higher than the one-time compliance costs associated with the Program Renewal.

ES.10.2 REDUCED FREQUENCY ALTERNATIVE

Under the Reduced Frequency Alternative, the types of maintenance activities undertaken by Valley Water would not change, but the recurrence of sediment removal and vegetation management activities would occur less frequently than under the Program Renewal. However, bank stabilization, management of animal conflicts, and minor maintenance activities would continue to occur as needed. All other aspects of the Program Renewal (e.g., new/revised BMPs) would be implemented under this alternative.

Under the Program Renewal, the recurrence of activities is projected for a 10-year period and would be influenced by a variety of factors, including the type of maintenance activity, where that activity would occur (e.g., levee or bank; unmodified channel), and the site-specific factors at a particular location (e.g., rate of sediment accumulation or vegetation growth). The need for sediment removal or instream vegetation management typically would be based on field observations of reduced channel capacity from sediment accumulation or vegetation growth; non-instream vegetation management would be based on managing annual growth, including the removal of vegetation using both pre-emergent and post-emergent herbicides. Under the Reduced Frequency Alternative, the recurrence of sediment removal and vegetation management activities at any location would be half as frequent as under the Program Renewal. For example, if a stream reach was projected in the Program Renewal to need sediment removed in 4 out of 10 years, under the Reduced Frequency Alternative, sediment would be removed in 2 out of 10 years.

Although maintenance activities would occur less frequently, the amount of maintenance done during each event likely would need to be greater to fulfill maintenance needs. For instance, a greater amount of sediment removal or instream vegetation management would need to occur during a maintenance event to maintain the design flood flow conveyance capacity during the longer periods between maintenance episodes. A greater amount of non-instream vegetation management also would need to occur during a maintenance event, to address fire hazards on roads and levees associated with a greater amount of vegetation growth. Similarly, different types of maintenance may be necessary (e.g., removal of larger trees may require larger equipment).

ES.10.3 LIMITED WORK IN UNMODIFIED CHANNELS ALTERNATIVE

Under the Limited Work in Unmodified Channels Alternative (Limited Work Alternative), maintenance activities that could be done in unmodified channels would be limited to within 100 feet upstream and downstream of human-made structures, such as bridges, road crossings, stream gauges, outfalls, and trash racks. As a result, a reduced amount of annual maintenance would occur under this alternative. Maintenance near human-made structures would be necessary because it would keep these structures functioning properly and safely. Necessary maintenance activities in unmodified channels located away from human-made structures would not occur, resulting in increased flood risk or unaddressed maintenance

needs. All other aspects of the Program Renewal (e.g., the currently proposed BMPs) would be implemented under this alternative.

ES.10.4 LIMITED ACTIVITIES ALTERNATIVE

Under the Limited Activities Alternative, those maintenance activities with the greatest biological impacts would be eliminated or modified. For bank stabilization activities, no hardening of stream banks would be allowed and only "soft" stabilization measures would be used. For sediment removal activities, equipment would always be located at the top of the bank and would not be allowed in the stream channel. For vegetation management activities, no herbicide use would be allowed, and only mechanical vegetation management methods would be utilized. For management of animal conflicts, no herbicides or fumigants use would be allowed. Minor maintenance activities would be conducted as described under the Program Renewal. Relying on the alternative methods described above such as "soft" bank stabilization methods, operating equipment only from top of bank, and only using mechanical vegetation management methods would result in increased efforts to accomplish the same degree of necessary maintenance. Alternative methods also may result in higher implementation costs and/or less maintenance work getting accomplished each year.

ES.11 COMPARISON OF ALTERNATIVES AND THE ENVIRONMENTALLY SUPERIOR ALTERNATIVE

Impacts of the alternatives are described in detail in DSEIR Chapter 5, *Alternatives Analysis*, and compared to impacts of the Program Renewal. Weighing the impacts on all resource areas and the ability to achieve project objectives, the Program Renewal is considered to be environmentally superior. Compared to any of the other alternatives, it strikes the most appropriate balance between managing flood risk, protecting the ecological integrity of the SMP channels, and addressing other short- and long-term impacts associated with maintenance activities.

Among the alternatives to the Program Renewal considered in this chapter, the Limited Activities Alternative is considered the environmentally superior alternative because by limiting the type of activities to remove hard stabilization techniques, only allowing equipment to operate from the top of bank, and not using herbicide or fumigants, it would reduce many impacts associated with these activities such as impacts on tribal cultural resources, transportation, noise, hazards, energy, biological resources, air quality, and aesthetics. However, this alternative would also be likely to impede sediment removal that would be necessary to maintain flood flow conveyance capacity. The need for repeat bank repairs could increase the impacts associated with such maintenance activities. Lastly, this alternative would result in increased effort to accomplish the same degree of necessary maintenance and also may result in higher implementation costs and/or less maintenance work getting accomplished each year. The other alternatives were not selected as the environmentally superior alternative for the following reasons:

- ***No Project Alternative***. Although this alternative would provide only a slight reduction in the maintenance of the design flow or appropriate conveyance capacity of facilities, maintenance would not necessarily be conducted in a timely manner to avoid flood hazards. Furthermore, maintenance activities may not be implemented along with a

comprehensive mitigation approach and a consistent set of BMPs. Therefore, flood risk would be greater and, at the same time, more residual impacts would remain.

- ***Limited Work Alternative***. As a result of reduced maintenance activities in unmodified reaches, this alternative would promote the ecological structure and function of these reaches and, therefore, would reduce a variety of impacts related to the Program Renewal in those locations. However, this alternative would result in increased flood risk along unmodified channels and resulting impacts on downstream creek systems.
- ***Reduced Frequency Alternative.*** This alternative would lessen impacts on biological resources, as extended intervals between maintenance activities would provide ecosystems more time to recover their ecological structure and function, leading to a modest reduction in effects on wetland and riparian habitats. However, the longer gaps between maintenance would also result in increased sediment buildup and instream vegetation growth, causing a more pronounced temporary decline in conveyance capacity and limiting the ability to maintain the design flow or appropriate conveyance capacity of facilities. Additionally, the extended period between maintenance activities would allow more non-instream vegetation to grow unchecked, temporarily heightening fire hazards along roads and levees.

ES.12 SUMMARY OF IMPACTS AND LEVELS OF SIGNIFICANCE

Table ES-1 summarizes the impacts, mitigation measures, and levels of significance identified in this document.

Table ES-1. Summary of Potential Impacts and Mitigation Measures

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
Impacts				
3.2 Aesthetics				
AES-1:	Substantial Adverse Effects on Scenic Vista	LTS	None Required	LTS
AES-2:	Substantial Damage to Publicly Visible Scenic Resources, including but not Limited to Trees, Rock Outcroppings, and Historic Buildings Viewed from a State or Locally Designated Scenic Highway	S	MM BIO-12	LTSM
AES-3:	Substantial Degradation of the Existing Visual Character or Quality of the Site and its Surroundings in Non-	LTS	None Required	LTS

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
	urbanized and Urbanized Areas.			
AES-4:	Conflict with Applicable Zoning and Other Regulations Governing Scenic Quality in Urbanized Areas	LTS	None Required	LTS
AES-5:	Substantial Alteration to Day or Nighttime Views resulting from Additional Light or Glare	NI	None Required	NI
3.3 Air Quality				
AIR-1:	Conflict with or Obstruct Implementation of Applicable Air Quality Plans	LTS	None Required	LTS
AIR-2:	Temporary Increase in ROG, NOx, PM_{10}, and $PM_{2.5}$ Emissions during Maintenance Activities	LTS	None Required	LTS
AIR-3:	Expose Sensitive Receptors to Substantial Pollutant Concentrations (Diesel PM and Pesticides) during Maintenance Activities	LTS	None Required	LTS
AIR-4:	Creation of Objectionable Odors	LTS	None Required	LTS
3.4 Biological Resources				
BIO-1A:	Impacts on Serpentine-Associated Special-Status Plant Species	S	MM BIO-1: Pay Santa Clara Valley Habitat Plan Nitrogen Deposition Fees	LTSM
BIO-1B:	Impacts on Non-Serpentine-Associated Special-Status Plant Species	S	MM BIO-2: Create or Enhance and Preserve Mitigation Populations of Non-VHP-Covered Special-Status Plant Species	LTSM
BIO-1C:	Impacts on the Monarch Butterfly, Crotch's Bumble Bee, and Large Marble Butterfly	LTS	None Required	LTS

Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
BIO-1D: Impacts on Steelhead	S	MM BIO-3: Augmentation of Spawning Gravel MM BIO-4: Augmentation of Instream Complexity MM BIO-5: Salmonid Habitat Restoration	LTSM
BIO-1E: Impacts on the Pacific Lamprey	S	MM BIO-3, MM BIO-4, MM BIO-5	LTSM
BIO-1F: Impacts on the Riffle Sculpin	LTS	None Required	LTS
BIO-1G: Impacts on Native, Special-Status Minnows (Hitch and Roaches)	LTS	None Required	LTS
BIO-1H: Impacts on Estuarine, Special-Status Fish (Longfin Smelt and Sturgeons)	LTS	None Required	LTS
BIO-1I: Impacts on Essential Fish Habitat and Species Subject to Fisheries Management Plans	LTS	None Required	LTS
BIO-1J: Impacts on the California Tiger Salamander, California Red-Legged Frog, and Foothill Yellow-Legged Frog	S	MM BIO-6: Avoid Impacts on California Tiger Salamander, California Red-Legged Frog, and Foothill Yellow-Legged Frog Habitat MM BIO-7: Compensatory Mitigation for Impacts on Habitat for the California Tiger Salamander, California Red-Legged Frog, Foothill Yellow-Legged Frog, and Northwestern Pond Turtle	LTSM
BIO-1K: Impacts on the Northwestern Pond Turtle	S	MM BIO-7	LTSM
BIO-1L: Impacts on the California Horned Lizard, Santa Cruz Black Salamander, and California Giant Salamander	LTS	None Required	LTS
BIO-1M: Impacts on Nonbreeding Special-Status Birds	LTS	None Required	LTS
BIO-1N: Impacts on Certain Nesting Special-Status Birds	LTS	None Required	LTS

Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
BIO-1O: Impacts on the California Ridgway's Rail, California Black Rail, Salt Marsh Harvest Mouse, Salt Marsh Wandering Shrew, and Alameda Song Sparrow	S	MM BIO-8: Island Ponds Mitigation	LTSM
BIO-1P: Impacts on the Western Snowy Plover, Swainson's Hawk, Tricolored Blackbird, Long-Eared Owl, Loggerhead Shrike, and San Francisco Common Yellowthroat	LTS	None Required	LTS
BIO-1Q: Impacts on the Least Bell's Vireo and Yellow-Breasted Chat	S	MM BIO-9: Compensatory Mitigation for Impacts on Least Bell's Vireo and Yellow-Breasted Chat Nesting and Foraging Habitats	LTSM
BIO-1R: Impacts on the Burrowing Owl	LTS	None Required	LTS

BIO-1U: Impacts on the San Francisco Dusky-Footed Woodrat	LTS	None Required	LTS
BIO-1V: Impact BIO-1V: Impacts on the Pallid Bat, Townsend's Big-Eared Bat, and Non-Special-Status Bats	S	Mitigation Measure BIO-11: Provide Alternative Bat Roost	LTSM
BIO-1W: Impacts on the San Joaquin Kit Fox	LTS	None Required	LTS
BIO-1X: Impacts on the Mountain Lion, American Badger, Ringtail, and Western Red Bat	LTS	None Required	LTS
BIO-1Y: Impacts on the Pacific Harbor Seal	LTS	None Required	LTS
BIO-1Z: Impacts on Non-Special-Status Animal Species	S	MM BIO-1 through MM BIO-5, MM BIO-7 through MM BIO-13	LTSM

Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
BIO-1A: Impacts on the Bay Checkerspot Butterfly	S	MM BIO-1	LTSM
BIO-2A: Loss or Disturbance of Riparian Habitat, Including Sycamore Alluvial Woodland	S	MM BIO-12: Compensatory Mitigation for Impacts to Woody Riparian Vegetation	LTSM
BIO-2B: Loss or Disturbance of Non-Riparian/Non-Wetland Sensitive Plant Communities	LTS	None Required	LTS
BIO-3: A Substantial Adverse Effect on State or Federally Protected Wetlands and Waters through Direct Removal, Filling, Hydrological Interruption, or Other Means	S	MM BIO 13: Compensatory Mitigation for Permanent Impacts to Wetlands and Aquatic Habitats	LTSM
BIO-4A: Interference with Wildlife Movement	LTS	None Required	LTS
BIO-4B: Interference with the Use of Native Wildlife Nursery Sites	S	None Available	SU
BIO-5: Conflict with Any Local Policies or Ordinances Protecting Biological Resources, such as a Tree Preservation Policy or Ordinance	LTS	None Required	LTS
BIO-6: Conflict with the Provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or Other Approved Local, Regional or State Habitat Conservation Plan	LTS	None Required	LTS
3.5 Cultural and Paleontological Resources			
CR-1: Adverse Effect on Known and Previously Undiscovered	LTS	None Required	LTS

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
	Archaeological or Historical Resources			
CR-2:	Disturbance of Human Remains	LTS	None Required	LTS
CR-3:	Impacts to Sensitive Paleontological Resources	LTS	None Required	LTS
3.6 Energy				
ENE-1:	Result in a Significant Environmental Impact Due to Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources	LTS	None Required	LTS
ENE-2:	Conflict With or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency	NI	None Required	NI
3.7 Greenhouse Gases				
GHG-1:	Generate GHG Emissions, Either Directly or Indirectly, That May Have a Significant Impact on the Environment	S	MM GHG-1: GHG Emissions Reduction Practices for Maintenance Activities MM GHG-2: GHG Emissions Mitigation Program	LTSM
GHG-2:	Conflict with an Applicable Plan, Policy, or Regulation of an Agency Adopted for the Purpose of Reducing the Emissions of GHGs	S	MM GHG-1, MM GHG-2	LTSM
3.8 Hazards and Hazardous Materials				
HAZ-1:	Create a Significant Hazard to the Public or Environment through the Routine Use, Transport, Disposal, or Accidental Release of Hazardous Materials	S	MM HAZ-1: Implement Dust Control Measures in Areas Containing NOA and in the Event of High Risk of Valley Fever	LTSM
HAZ-2:	Impair Implementation of or Physically Interfere with an Adopted Emergency	LTS	None Required	LTS

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
	Response Plan or Emergency Evacuation Plan			
HAZ-3:	Be Located on a Site Included on a List of Hazardous Materials Sites Compiled Pursuant to Government Section Code 56962.5	LTS	None Required	LTS
HAZ-4:	Be Located on a Previously Undiscovered Contaminated Site	LTS	None Required	LTS
HAZ-5:	Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within 0.25 Mile of an Existing or Proposed School	S	MM HAZ-1	LTSM
HAZ-6:	Create a Significant Hazard to Construction Workers or the Public Through the Exposure to Valley Fever During Construction Activities	S	MM HAZ-1	LTSM
3.9 Hydrology and Geomorphology				
HYD/GM-1:	Substantially Decrease Groundwater Supplies or Interfere Substantially with Groundwater Recharge Such that the Project May Impede Sustainable Groundwater Management of the Basin	LTS	None Required	LTS
HYD/GM-2:	Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River or	LTS	None Required	LTS

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
	Through the Addition of Impervious Surfaces, in a Manner Which Would: (i) Result in substantial erosion or siltation on- or off-site			
HYD/GM-2 (ii):	Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite	LTS	None Required	LTS
HYD/GM-2 (iii):	Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems	LTS	None Required	LTS
HYD/GM-2 (iv):	Impede or redirect flood flows	LTS	None Required	LTS
HYD/GM-3:	Conflict with or Obstruct Implementation of a Sustainable Groundwater Management Plan	LTS	None Required	LTS
3.10 Noise				
NZ-1:	Substantial Temporary or Permanent Increase in Ambient Noise Levels in the Vicinity of the Proposed Maintenance Areas in Excess of City or County Standards or Generate a Substantial Incremental Increase in Noise Levels	S	MM NZ-1: Implement Noise and Vibration Reduction Measures to Align with Local Noise Standards	SU
NZ-2:	Generate Excessive Ground Vibration or Ground-borne Noise Levels	S	MM NZ-1	SU
NZ-3:	Be Located within the Vicinity of a Private Airstrip or an Airport Land Use Plan or within Two Miles of a	NI	None Required	NI

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
	Public Airport, and Expose People Residing or Working in the Project Area to Excessive Noise Levels			
3.11 Public Services and Utilities				
PSU-1:	New or Physically Altered Public Services Facilities, including Police, Fire, Parks, and Schools	LTS	None Required	LTS
PSU-2:	Relocated, New, or Expanded Utilities and Service System Facilities or Disruptions of Utilities and Service System Facilities including Storm Drainage, Electric Power, Natural Gas, or Telecommunications Facilities	LTS	None Required	LTS
PSU-3:	Effects on Wastewater Treatment Demand and Water Supply	LTS	None Required	LTS
PSU-4:	Exceedance of Landfill Capacity or Non-Compliance with Regulations Related to Disposal of Excavated Sediment or Other Materials	LTS	None Required	LTS
3.12 Traffic and Transportation				
TR-1:	Conflict With a Program, Plan, Ordinance, or Policy Addressing the Circulation System Including Transit, Roadway, Bicycle, and Pedestrian Facilities	LTS	None Required	LTS
TR-2:	Conflict with CEQA Guidelines Section	LTS	None Required	LTS

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
	15064.3, Subdivision (b)			
TR-3:	Substantially Increase Hazards Due to Geometric Design Features and Incompatible Uses or Result in Inadequate Emergency Access	LTS	None Required	LTS
3.13 Tribal and Cultural Resources				
TCR-1:	Adverse Change in the Significance of Known and Previously Undiscovered Tribal Cultural Resources	LTS	None Required	LTS
3.14 Water Quality				
WQ-1:	Water Quality Degradation Resulting in Violation of Surface Water Quality Standards or WDRs; or Otherwise Substantially Degrade Surface Water Quality	LTS	None Required	LTS
WQ-2:	Water Quality Degradation Resulting in Violation of Ground Water Quality Standards; or Otherwise Substantially Degrade Ground Water Quality	LTS	None Required	LTS
WQ-3:	Create or Contribute Runoff Water that Would Provide Substantial Additional Sources of Polluted Runoff	LTS	None Required	LTS
WQ-4:	In Flood Hazard, Tsunami, or Seiche Zones, Risk Release of Pollutants Due to Project Inundation	LTS	None Required	LTS
WQ-5:	Conflict with or Obstruct Implementation of a	S	MM BIO-3, MM BIO-4, MM BIO-5	LTSM

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
	Water Quality Control Plan			
3.15 Wildfire				
WF-1:	Substantially Impair an Adopted Emergency Response Plan or Emergency Evacuation Plan	LTS	None Required	LTS
WF-2:	Exacerbate Wildfire Risks and Thereby Expose People or Structures to a Significant Risk of Loss, Injury, or Death; or Expose Project Occupants to Pollutant Concentrations from a Wildfire or the Uncontrolled Spread of a Wildfire	LTS	None Required	LTS
WF-3:	Require the Installation or Maintenance of Infrastructure that may Exacerbate Fire Risk or Result in Temporary or Ongoing Impacts to the Environment	LTS	None Required	LTS
WF-4:	Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes	LTS	None Required	LTS
Cumulative Impacts				
AES-1:	Cumulative Impacts on Aesthetics	LTSM	MM BIO-13	LTSM
AIR-1:	Cumulative Air Quality Impacts	LTS	None Required	LTS
BIO-1:	Cumulative Impacts on Special-status Species	S	MM BIO-1, MM BIO-2, MM BIO-3, MM BIO-4, MM BIO-5, MM BIO-6, MM BIO-7, MM BIO-8, MM BIO-9, MM BIO-10, MM BIO-11	LTSM
BIO-2:	Cumulative Impacts on Riparian Habitat or	LTS	None Required	LTS

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
	Other Sensitive Natural Communities			
BIO-3:	Cumulative Effects on State or Federally Protected Wetlands and Waters	S	MM BIO-13	LTSM
BIO-4:	Cumulative Impacts on Movement of Any Native Resident or Migratory Species or Established Wildlife Corridors, or on Use of Native Wildlife Nursery Sites	S	None Available	SU
BIO-5:	Cumulative Effects of Conflicts with Local Policies or Ordinances Protecting Biological Resources, or Conflicts with the Provisions of an Adopted HCP, NCCP, or Other Approved Conservation Plan	LTS	None Required	LTS
CR-1:	Cumulative Effects on Cultural, Paleontological, and Tribal Cultural Resources	LTS	None Required	LTS
ENE-1:	Cumulative Impacts on Energy	LTS	None Required	LTS
GHG-1:	Cumulative Impacts of Greenhouse Gas Emissions	S	MM GHG-1, MM GHG-2	LTSM
HAZ-1:	Cumulative Impacts of Hazards and Hazardous Materials	S	MM HAZ-1	LTSM
HYD/GM-1:	Cumulative Impacts on Hydrology and Geomorphology	LTS	None Required	LTS
NZ-1:	Substantial Temporary or Permanent Increase in Ambient Noise Levels or Substantial Incremental Increase in Noise Levels	S	MM NZ-1	SU

	Potential Impact	Level of Significance before Mitigation[1]	Mitigation Measures	Level of Significance after Mitigation[1]
NZ-2:	Cumulative Impacts from Ground Vibration or Ground-borne Noise Levels	S	MM NZ-1	SU
NZ-3:	Cumulative Impacts from Siting of Noise-sensitive Land Uses or Receptors in the Vicinity of a Private Airstrip, Airport Land Use Plan, or within Two Miles of a Public Airport	LTS	None Required	LTS
PSU-1:	Cumulative Effects on Public Services and Utilities	LTS	None Required	LTS
TR-1:	Cumulative Impacts to Traffic and Transportation	LTS	None Required	LTS
WQ-1:	Cumulative Effects on Water Quality	S	MM BIO-3, MM BIO-4, MM BIO-5	LTSM
WF-1:	Cumulative Impacts Related to Wildfire	LTS	None Required	LTS

Chapter 1
Introduction

The Santa Clara Valley Water District (Valley Water) has prepared this Draft Subsequent Environmental Impact Report (DSEIR) to provide the public, responsible agencies, and trustee agencies with information about the potential environmental effects associated with implementing Valley Water's Stream Maintenance Program (SMP or Program) Renewal (also referred to as SMP-3 or Program Renewal). Valley Water has administered the SMP since 2001 to guide, manage, and conduct routine maintenance activities of streams, improved channels, and related flood protection facilities. This DSEIR was prepared in compliance with the requirements of the California Environmental Quality Act (CEQA) (as amended) and the CEQA Guidelines (California Code of Regulations [Cal. Code Regs.], tit. 14, Section 15000 et seq.). Valley Water is the lead agency for the Program under CEQA and has overall authority for approving the Program.

This DSEIR describes and summarizes the proposed actions of the Program Renewal in Chapter 2, *Project Description*, and analyzes environmental impacts and mitigation measures in the environmental resource sections in Chapter 3, *Environmental Setting and Impact Analysis*. More detail is provided in the SMP Manual, which is included in its entirety in **Appendix A**, *Stream Maintenance Program Manual 2027-2036*, of this DSEIR.

1.1 VALLEY WATER

Valley Water is a special district created by the State Legislature to act not only as Santa Clara County's (the County's) water wholesaler but also as its flood protection agency and the steward for its streams and creeks, underground aquifers, and reservoirs on which Valley Water holds land rights. Valley Water carries out its responsibilities in an environmentally responsible and cost-effective manner, led by a Board of Directors composed of seven members, each elected from geographical areas within the County.

As the County's water wholesaler, Valley Water ensures a dependable supply of clean, safe water for homes and businesses. As the agency responsible for local flood protection, Valley Water works diligently to protect Santa Clara Valley residents and businesses from the devastating effects of flooding. Valley Water's stream stewardship includes creek restoration and wildlife habitat projects, mitigation monitoring, stream maintenance, pollution prevention efforts, and a commitment to natural flood protection.

1.2 PROGRAM BACKGROUND

Valley Water is responsible for water supply, flood protection, and stream stewardship for approximately 333 miles of streams and channels in Santa Clara County, California, of which 185 miles are constructed and improved channels. Valley Water manages streams, canals, reservoirs, dams, pipelines, groundwater percolation facilities, and water treatment plants throughout the County to fulfill its responsibilities. Valley Water-managed flood protection

facilities require maintenance to ensure that the designed function of each facility is maintained. Prior to 2002, Valley Water conducted maintenance activities as needed. In 2002, Valley Water implemented SMP-1 as an ongoing program with an indefinite time horizon to guide routine maintenance activities within Valley Water's creeks and canals. The difference between stream maintenance conducted before the SMP (pre-2002) and SMP-1 (2002–2012) was the SMP's comprehensive approach to managing and tracking the maintenance work and costs, its monitoring of environmental conditions, and its approach of mitigating for the entire Program, rather than on an individual project basis. The SMP is used by Valley Water staff to ensure that routine stream maintenance practices are conducted in an efficient, consistent, and environmentally sensitive manner.

Although the SMP is an ongoing program, the SMP-1 Manual and final environmental impact report (FEIR), certified in 2002, used a 20-year planning horizon to forecast SMP activities and consider potential environmental effects. In 2011, Valley Water updated the Program and Manual to cover the second program period (2012-2022), which is referred to as "SMP-2" and involved renewing necessary SMP permits and environmental compliance documentation. A subsequent environmental impact report (SEIR) and FEIR were prepared for the SMP-2 update and the FEIR was certified in 2012.

A Notice of Determination for the SMP-1 and SMP-2 Update EIRs were filed on July 12, 2002, and February 14, 2012, respectively, with the State Clearinghouse (SCH Nos. 2000102055 and 2000102055, respectively), completing the CEQA review requirements for the SMP Update process. The requirements and policies of the SMP were finalized in 2002 and 2012 when Valley Water received authorizations from all the permitting agencies with jurisdiction over the program, as shown in Table 2-9 in Chapter 2, *Project Description*.

In 2023, Valley Water requested extensions from regulatory agencies for various SMP-2 permits that were set to expire in 2023. Valley Water received several permit extensions with variable expiration dates. Dates of the permit extensions are provided in Table 2-9 in Chapter 2, *Project Description*.

This Program update (including the updated SMP Manual and this CEQA document) is intended to cover the third 10-year planning period from 2027 through 2036. The permit extensions will cover the gap from 2023 through 2026. These updated Program Renewal documents are intended to fully replace the previous SMP-2 Manual and its supporting documents. In general, the Program Renewal is a continuation of past routine creek maintenance activities in the same areas, using many of the same techniques. The Program Renewal includes some updates to the Program, including the addition of new work activities and updates to the Program work limits. More details regarding the Program Renewal are provided in Chapter 2, *Project Description*.

The SMP Manual (included as Appendix A in this DSEIR) and the contents of the DSEIR are complementary volumes. As such, the DSEIR references or summarizes detailed information presented in the SMP Manual frequently to avoid repeating information. The reader is encouraged to review the SMP Manual while reviewing the DSEIR for more detailed information on the Program Renewal.

1.3 OVERVIEW OF CEQA REQUIREMENTS

CEQA is the cornerstone of environmental law and policy in California. CEQA's primary objectives are to (CEQA Guidelines Section 15002):

- Ensure that the significant environmental effects of proposed activities are disclosed to decision makers and the public;
- Identify ways to avoid or reduce environmental damage; prevent environmental damage by requiring implementation of feasible alternatives; and avoid, minimize, reduce and/or compensate for environmental impacts through implementation of mitigation measures;
- Disclose the reasons for agency approval of projects with significant environmental effects;
- Foster multidisciplinary interagency coordination in the review of projects; and
- Allow for public participation in the planning process.

With certain, strictly limited exceptions, CEQA requires all state and local government agencies to consider the environmental consequences of projects over which they have discretionary authority before taking action on those projects. CEQA establishes both procedural and substantive requirements that agencies must satisfy to meet CEQA's objectives. For example, the agency with decision-making authority (the lead agency) must first assess whether a proposed project would result in significant environmental impacts. If there is substantial evidence that the project would result in significant environmental impacts not capable of mitigation, CEQA requires that the agency prepare an EIR, analyzing both the proposed project and a range of feasible alternatives.

As described in CEQA Guidelines Section 15121(a), an EIR is an informational document that assesses potential environmental effects of a proposed project as well as identifies mitigation measures and alternatives to the project that could reduce or avoid adverse environmental impacts (CEQA Guidelines Section 15121). Other key CEQA procedural requirements include developing a plan to monitor implementation of adopted mitigation measures and carrying out specific public noticing and distribution steps to facilitate public involvement in the environmental review process. Public agencies with discretionary authority over a proposed project must consider the information in the EIR, along with any other relevant information, in making decisions on a proposed project.

1.3.1 CEQA Requirements for Subsequent EIRs

CEQA Guidelines Section 15162 indicate that a Subsequent EIR should be prepared when:

- Substantial changes are proposed in the project which will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;
- Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

- New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete shows any of the following:
  - The project will have one or more significant effects not discussed in the previous EIR;
  - Significant effects previously examined will be substantially more severe than shown in the previous EIR;
  - Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or
  - Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

CEQA Guidelines Section 15162 also states that a subsequent EIR shall be given the same notice and public review as required under Section 15087 and Section 15072. A subsequent EIR shall state where the previous document is available and can be reviewed.

Valley Water has determined that the previous SMP and related circumstances have changed substantially enough that the preparation of a subsequent EIR is appropriate. Specifically, the following types of changes to the SMP contributed to this decision:

- New maintenance activities are proposed (e.g., addition of hazard tree management, addition of the removal of trees greater than 12 inches diameter at breast height (dbh), and expansion of the minor maintenance work category and animal conflicts category).
- Updates to Program work limits are proposed.
- Updates to the Program's mitigation approach and refinements to the Best Management Practices (BMPs) are proposed.

In addition, several changes in the physical and regulatory environment have occurred, as follows:

- Several species are now listed as threatened or endangered under either the California or federal Endangered Species Act that were not listed in 2012, and several other non-listed species have been identified as special status species that were not special status species in 2012.
- The CEQA Guidelines were updated with additional requirements regarding the analysis of resources such as paleontological resources, global climate change, biological resources, tribal cultural resources, water resources, energy, wildfire, transportation, cultural resources, and hazardous materials.

1.3.2 Intended Use of this SEIR

Valley Water is the lead agency for the CEQA process and has discretionary review and approval authority for the project (CEQA Guidelines Section 15378). Valley Water will use the analyses presented in the SEIR and the public comments on them to evaluate the Program Renewal's environmental impacts. The Valley Water Board of Directors will be responsible for considering whether to certify the FSEIR and approve the Program Renewal.

This DSEIR has been prepared in accordance with CEQA to evaluate the environmental impacts of implementing the Program Renewal. In accordance with CEQA Guidelines Section 15126, this SEIR would be used as the primary environmental document for evaluating all subsequent discretionary planning and permitting actions for the project, as described in Chapter 2*, Project Description*, Section 2.9.

1.4 CEQA PROCESS

The following discussion explains the steps in the CEQA process for the Program Renewal.

1.4.1 Notice of Preparation

A Notice of Preparation (NOP) for the Program Renewal was prepared in accordance with the CEQA Guidelines Section 15082 and was circulated through the Office of Planning and Research's State Clearinghouse on May 27, 2022 (State Clearinghouse Number 2000102055). The NOP response period started on May 27, 2022, and continued for 30 days, concluding on June 27, 2022. The NOP presented general background information on the SMP, the scoping process, and the environmental issues to be addressed in the DSEIR. Copies of the NOP were distributed by mail and email to a broad range of stakeholders, including state, federal, and local regulatory agencies and jurisdictions, utilities, and interested individuals in the area. In addition, the NOP was published on Valley Water's website:

https://www.valleywater.org/project-updates/stream-maintenance-program

The NOP is included in this DSEIR in **Appendix B**, *Notice of Preparation and Comments Received*.

1.4.2 Scoping Comments and Meeting

To provide the public, as well as responsible and trustee agencies, an opportunity to ask questions and submit comments on the SMP and the scope of the DSEIR, Valley Water held a public scoping meeting on June 16, 2022, at 5:45 p.m. at the Valley Water Headquarters Building Boardroom and via Zoom during the public scoping period. As described above, notices of the meeting were mailed to interested parties; in addition, scoping meeting information was published prior to the event on Valley Water's website:

https://www.valleywater.org/project-updates/stream-maintenance-program

Valley Water accepted verbal and written comments at the scoping meeting and accepted both written and electronic comments (via email) during the 30-day scoping period. During the scoping period, nine comment letters were received. These comments were considered in preparing this DSEIR and are summarized in Appendix B.

1.4.3 Subsequent DEIR Distribution and Public Review Process

Valley Water prepared this DSEIR, as informed by public and agency input received during the scoping period, to disclose environmental impacts associated with the Program Renewal. Where any such impacts are significant, feasible mitigation measures and potentially feasible alternatives that would substantially lessen or avoid such effects are identified and discussed. The public review period allows the public an opportunity to provide input to the lead agency on the DSEIR.

The DSEIR is currently undergoing public review for 45 days. Valley Water will hold one public meeting to receive comments on the DSEIR on August 27, 2025, at 12:00 pm. The meeting will be held online (https://valleywater.zoom.us/j/89607301512. Webinar ID: 896 0 730 1512, Call-in: 1-(669) 444-9171). The meeting will begin with an overview of the Program and the analysis and conclusions set forth in the DSEIR. The introductory presentation will be followed by the opportunity for interested members of the public to provide comments to Valley Water on the DSEIR. Commenters may provide oral comments at the meeting.

For those interested, written comments or questions concerning the DSEIR can be submitted within the public review period via email (preferred) or mail to the name and address below:

Santa Clara Valley Water District
Attn: Billy Williams
5750 Almaden Expressway
San Jose, CA 95118
BWilliams@valleywater.org

The DSEIR and appendices can be reviewed on any Valley Water business day between the hours of 8:00 a.m. and 5:00 p.m. Monday through Friday at Valley Water headquarters, located at the address shown above, or on the Valley Water Web site at [https://www.valleywater.org/project-updates/stream-maintenance-program]. The DSEIR also will be available at the libraries listed below during their normal operating hours:

- Dr. Martin Luther King, Jr. Library; 150 E. San Fernando St.; San Jose, CA 95112
- Morgan Hill Public Library; 660 W. Main Ave.; Morgan Hill, CA 95037
- Palo Alto (Rinconada) Public Library; 1213 Newell Rd.; Palo Alto, CA 94303
- Cupertino Public Library; 10800 Torre Avenue; Cupertino, CA 95014-3207
- Milpitas Public Library; 160 N. Main Street; Milpitas, California 95035

1.4.4 Certification of the Final Subsequent EIR and Project Approval

Once the public review period is closed, Valley Water will prepare a final subsequent EIR (FSEIR) addressing all substantive comments received on the DSEIR. The FSEIR will contain all comments submitted on this DSEIR (including those made at public meetings), responses to those comments, and the text of this DSEIR with revisions made to in response to public comments, as well as staff-initiated revisions. After review of the FSEIR, the Valley Water Board of Directors will then consider certifying the FSEIR as complying with CEQA, adopting CEQA findings of fact and, if necessary, a statement of overriding considerations for significant and unavoidable impacts and approving the Program Renewal.

A Notice of Determination (NOD) would then be filed with the Office of Planning and Research and at the County Clerk's office (14 Cal. Code Regs. Section 15093[c]).

1.5 ORGANIZATION OF THIS SUBSEQUENT DEIR

The content and format of this SEIR are designed to meet the requirements of CEQA. This DSEIR is organized into the following chapters:

- ***Executive Summary***. A summary of the Program Renewal, the issues of concern, project alternatives, environmental impacts, and mitigation measures are provided in this chapter.
- **Chapter 1, *Introduction***. This chapter describes the purpose and organization of the Draft EIR and its preparation, review, and certification process.
- **Chapter 2, *Project Description***. This chapter summarizes the Program Renewal, including: a description of the background and development process; a description of the Program's purpose and objectives; a description of the Program Renewal Area and facilities where the Program Renewal is implemented; the Program approach and proposed activities; Program implementation and oversight; avoidance and minimization measures (BMPs); and required permits and approvals associated with implementing the Program Renewal.
- **Chapter 3, *Environmental Setting and Impact Analysis***. This chapter contains an introduction to the impact analysis conducted in this DSEIR and identifies resource topic areas determined not to be affected by the Program Renewal (Section 3.1). Sections 3.2 through 3.15 describe the existing conditions and background information, the potential environmental impacts associated with the Program Renewal, and mitigation measures for any significant impacts for each resource topic. The purpose of providing the background and a description of the existing conditions is to give the reader an understanding of the resources that could be affected by the Program Renewal. For each resource topic, significance criteria are identified and used to determine the significance levels of the Program Renewal's potential impacts. Mitigation measures are also identified to reduce, where possible, any adverse effects from potentially significant impacts.
- **Chapter 4, *Other Statutory Considerations***. This chapter addresses the Program Renewal's potential to have growth-inducing impacts or contribute to cumulative impacts, defined as the incremental impact of the Program Renewal when added to other related impacts of past, present, and reasonably foreseeable future projects. In

addition, any impacts identified as significant and unavoidable are listed in this chapter.

- **Chapter 5, *Alternatives Analysis***. This chapter describes the process by which alternatives to the Program Renewal were developed and screened. It also evaluates likely environmental impacts of the potential alternatives and identifies the environmentally superior alternative.
- **Chapter 6, *Report Preparation***. This chapter identifies staff from Valley Water, Montrose Environmental, H. T. Harvey, Environmental Science Associates, and Stillwater Sciences who assisted in preparing this Draft EIR.
- **Chapter 7, *References***. This chapter provides a bibliography of printed references, websites, and personal communications used in preparing this Draft EIR.

Appendices

- Appendix A, *Stream Maintenance Program Manual 2027-2036*
- Appendix B, *Notice of Preparation and Comments Received*
- Appendix C, *General Plan Policies and Ordinances*
- Appendix D, *Air Quality and GHG Emissions Calculations*
- Appendix E, *Special-Status Plant Species Considered but Rejected*
- Appendix F*, Mitigation Feasibility Assessment Field Protocol*
- Appendix G, *Pesticide Regulatory Information*
- Appendix H, *Vehicle Miles Traveled (VMT) Calculations*
- Appendix I*, Mitigation Monitoring and Reporting Program*

Chapter 2
Project Description

2.1 INTRODUCTION AND BACKGROUND

The Santa Clara Valley Water District (Valley Water) manages approximately 333 miles of streams and channels throughout Santa Clara County, of which 185 miles are constructed and improved channels. Routine maintenance is necessary to reduce flood risks, ensure structural integrity of Valley Water facilities, enhance ecologic function, and ensure public safety.

Since 2001, Valley Water has administered the Stream Maintenance Program (SMP or Program) to guide, manage, and conduct routine maintenance of streams, improved channels, and related flood protection facilities such that these facilities can continue to provide adequate flow conveyance capacity and function properly. The first program period (2002-2012) is referred to as "SMP-1" and the associated EIR was certified in 2002 (SCVWD 2002).

In 2011, Valley Water updated the program (referred to as "SMP-2") and *Stream Maintenance Program Manual* (referred to as SMP Manual) to guide the program through the 2012-2022 planning period (SCVWD 2014). A subsequent EIR (SEIR) was prepared for the SMP-2 update and was certified in 2012 (SCVWD 2012).

In 2021, Valley Water initiated the third iteration of the SMP (also referred to as "SMP-3" or Program Renewal) to: (1) review SMP activities and revise the SMP Manual, (2) update its environmental compliance documentation, and (3) renew necessary SMP permits to guide the on-going program.

Although the SMP is an ongoing program (with an indefinite time horizon), the previous SMP-2 Manual and Final Environmental Impact Report (FEIR) used a 10-year planning period from 2012-2022 to forecast SMP activities and consider potential environmental impacts. In 2023, Valley Water requested extensions from regulatory agencies for various SMP-2 regulatory agency permits that were set to expire in 2023. Valley Water received permit extensions that are valid through 2026. The proposed Program Renewal (including the updated manual and this document) is intended to cover the 10-year planning period from 2027 to 2036. These updated program documents are intended to fully replace the previous SMP-2 Manual and its supporting documents.

This EIR evaluates the potential environmental effects of Program Renewal to provide the public, relevant public agencies, and stakeholders with information about the Program Renewal and its potential environmental effects. The EIR evaluates the Program Renewal as the proposed project under CEQA.

2.2 PROGRAM RENEWAL UPDATES

Valley Water has made several updates to the SMP Manual to reflect additional maintenance needs and refinements. Primary updates include the following:

- Removal of the "modified with ecological value" channel type designation. As noted in Section 2.5.1, "Channel Types and Ownership," this designation was superfluous and created redundancy issues for Valley Water. For the Program Renewal, Valley Water has reverted the channel classifications to the original two types: modified or unmodified. Channels classified as modified channel with ecological value in the previous SMP-2 Manual are now classified as a modified channel.
- Addition of hazard tree management for public safety purposes.
- Addition of removal of trees greater than 12 inches diameter at breast height (dbh) to the Program Renewal for public safety, fire safety, channel conveyance capacity, maintenance site access, and overall ecological health purposes.
- Removal of invasive plant management as a mitigation option in the Program Renewal. This activity is now included as a vegetation management activity until the countywide Integrated Invasive Plant Management (IIPMP) is implemented.
- Expansion of the minor maintenance work category to include trash boom maintenance, work at maintenance yards, floodwall maintenance, maintenance of the Palo Alto Flood Basin tide gates, and maintenance of fish ladders and passive flood barriers.
- Expansion of the management of animal conflicts category to include bat exclusion activities within the Upper Llagas Creek Flood Protection Project's high-flow bypass tunnel.
- Title change for the "Large Woody Debris" maintenance category to "Downed Tree Management" to more accurately describe the full range of downed tree management activities.
- Updates to Program work limits, which are listed below in Section 2.10.3, "Program Limits and Best Management Practices."
- Refinements to SMP Best Management Practices (BMPs) to reflect updated regulations and improved clarity.
- Updates to the Program's mitigation approach as described in Section 2.10, "Impact Avoidance and Minimization Measures and Compensatory Mitigation."

2.3 ACTIVITIES NOT COVERED

The Program would not include the following activities:

1. Emergency repair work[1];
2. Maintenance work that would increase the flow conveyance or water supply capacity of a facility beyond the designed conveyance channel capacity (as-built design);
3. Maintenance work in stream reaches that are above the 1,000-foot elevation contour;
4. Maintenance work for dams, reservoirs, and other water supply facilities, such as canals, pipelines outside of stream corridors, groundwater percolation ponds, and instream summer dams (maintenance of these facilities will have environmental coverage outside of the Program Renewal);
5. Installation or major modification of fish ladders;
6. Maintenance work conducted on private property by owners or other agencies (with the exception of urgent flood protection work described in Section 1.4.9 of the SMP Manual ((see Appendix A));
7. Maintenance work performed by other agencies;
8. Maintenance associated with capital improvement projects (CIPs) or large construction projects (e.g., projects outside the scope of SMP per-project limits) (see exceptions below).

While CIPs and large construction projects are not included in the Program Renewal, if a CIP is within the scope and size limits of the Program Renewal and a waiver is approved by the permitting agencies, ongoing maintenance for a CIP could be addressed through the SMP. For future CIPs, Valley Water will evaluate the construction and long-term operations and maintenance impacts in the environmental review documents. The CIP environmental review analysis may include a discussion of anticipated operations and maintenance activities that have already been mitigated under the SMP (where permanent mitigation areas [PMAs] have been established). These PMAs are specific to the work location and channel cross section, work activity type, work acreage and scope of work. Permanently mitigated work activities and qualifying areas in future CIPs may be performed under the Program Renewal.

Long-term routine maintenance needs associated with CIPs will be evaluated for their potential coverage by the SMP. Valley Water will identify whether such activities would be covered under existing PMAs or would require additional mitigation. CIPs with maintenance activities not covered by the SMP would need to obtain separate authorizations.

2.4 PROGRAM PURPOSE, GOALS, AND OBJECTIVES

The SMP was developed to provide guiding policies, specific direction on approach, and regulatory authorization for routine stream maintenance. The Valley Water Board of

[1] A situation is considered an "emergency" if it is a sudden, unexpected occurrence involving a clear and imminent danger that demands immediate action to prevent or mitigate loss of or damage to life, health, property, or essential public services (Public Resources Code Section 21060.3).

Directors (Valley Water Board) has adopted a series of Ends Policies to guide Valley Water in achieving its mission. Relevant Ends Policies that guide the SMP are listed below.

2.4.1 RELEVANT ENDS POLICIES

E-3 Natural Flood Protection: Natural flood protection is provided to reduce and improve health and safety for residents, businesses, and visitors now and into the future.

Goal 3.1 Maintain flood protection facilities to design levels of protection.

Objective 3.1.1 Prioritize maintenance of existing facilities over construction of new capital projects.

Objective 3.1.2 Inspect and maintain facilities on a regular basis.

Objective 3.1.3 Perform maintenance using maintenance guidelines updated on a regular basis.

E-4 Water Resources Stewardship: Water resources stewardship protects and enhances ecosystem health.

Goal 4.1 Use a science-based, inclusive approach to protect Santa Clara County's watersheds and aquatic ecosystems for current and future generations.

Objective 4.1.1 Develop and share data to support resilient ecosystems and healthy populations of native species.

Objective 4.1.2 Monitor stream, reservoir, and Bay ecosystem health.

Objective 4.1.3 Use data to prioritize and equitably implement actions to reduce pollution, restore endangered species habitat, and enhance ecosystem function.

Goal 4.2 Sustain ecosystem health while managing local water resources for flood protection and water supply.

Objective 4.2.1 Plan and design projects with multiple benefits, including protecting ecosystem functions, enhancing habitat, and improving connectivity, equitably in all regions of the county.

Objective 4.2.2 Operate Valley Water facilities to balance water supply, flood protection, and ecosystem sustainability.

Goal 4.3 Encourage inclusive, sustainable management of water resources in the Bay-Delta and its watersheds to protect imported water supply.

Objective 4.3.1 Meet future water supply demand through diverse and coordinated water supply planning.

Objective 4.3.2 Promote holistic ecosystem management through science-based decision-making.

Objective 4.3.3 Actively engage in the protection of source water quality through collaboration and funding.

Goal 4.4 Prevent and address pollution of local streams, reservoirs, and the Bay, equitably across all communities. Protect waterbodies from pollution and degradation.

Objective 4.4.1 Encourage stormwater capture, treatment, and reuse.

Objective 4.4.2 Prepare and respond to spills and dumping that threaten local waterways.

Objective 4.4.3 Collaborate with agencies and nonprofits to address homelessness, including supporting the provision of affordable housing by these agencies and nonprofits, and its impacts to Santa Clara County waterways.

2.4.2 PROGRAM GOALS AND OBJECTIVES

The overall goals of the Program Renewal are to:

- Maintain the flow conveyance capacity of Valley Water flood protection facilities to reduce flood risks and ensure public safety, and
- Maintain the structural and functional integrity of Valley Water flood protection facilities and lands.

To meet these goals, Valley Water prioritizes and administers maintenance activities to achieve the following objectives:

- Remove the necessary sediment to provide flow conveyance and safety while maintaining habitat functions in creek systems;
- Manage vegetation to maintain access, flow conveyance, flood protection, and public safety in Valley Water's channels and right-of-way. Vegetation management is also conducted to reduce fire fuel loads and wildfire risk and preserve the structural integrity of flood protection facilities. Vegetation management may also be conducted to promote overall ecological health, improve habitat for sensitive species, maintain restoration sites, and promote stewardship.
- Manage vegetation to allow levee inspections and provide inspection visibility and access to maintenance work sites;
- Stabilize eroding stream and channel beds and banks to protect existing infrastructure, maintain public safety, reduce sediment loading, protect water quality, and protect habitat values; and

- Avoid, minimize, or mitigate impacts on the environment by identifying and prioritizing when maintenance work is necessary and incorporating stream stewardship measures to further reduce potential impacts and enhance ecologic function where possible.

2.5 PROGRAM RENEWAL AREA

The Program Renewal Area is shown in **Figure 2-1** and includes Santa Clara County below the 1,000-foot elevation contour in both the Santa Clara Valley basin and Pajaro River watershed. However, Valley Water does not work in all channels and creeks below the 1,000-foot contour but maintains a much smaller subset of channels and streams. Maintenance activities are generally limited to locations where Valley Water has land rights or has maintenance obligations pursuant to effective licenses and agreements, for approximately 333 miles of creeks and channels. **Figures 2-2 through 2-6** provide additional sub-watershed maps for the Program Renewal Area.

Municipalities within the Program Renewal Area that contain Valley Water owned or maintained channels include the cities of Campbell, Cupertino, Gilroy, Los Altos, Milpitas, Monte Sereno, Morgan Hill, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga, and Sunnyvale, and the towns of Los Altos Hills and Los Gatos.

2.5.1 CHANNEL TYPES AND OWNERSHIP

Streams within the Program Renewal Area are generally classified by two types, as either a modified channel or an unmodified channel. The location of these channel types within each major watershed is shown in Figures 2-2 through 2-6. Photos displaying examples of the channel types are shown in **Figures 2-7 and- 2-8**. **Figure 2-9** illustrates a generalized cross section of a Valley Water channel prior to maintenance and after maintenance has occurred. Note that Figure 2-9 represents the wider and more complex channels in the Program Renewal Area, similar to the photo of Uvas Creek shown in Figures 2-7 and 2-8. Figure 2-9 also illustrates many of the channel features (e.g. top-of-bank, toe-of-slope, etc.) that are referred to throughout this document. **Figure 2-10** shows a cross section of a typical wide channel with a secondary channel, characteristic of larger channels as they flow towards the Bay.

In the previous SMP-2 Manual and based on input received from regulatory agencies, Valley Water included a third channel type referred to as “Modified Channel with Ecological Value”. Upon review, it became clear that additional channel designation created redundancy issues for work notification procedures, potential impact assessments, and other implementation tasks. Therefore, Valley Water has reverted the channel classifications to the original two types: modified or unmodified. Channels classified as modified channel with ecological value in the previous SMP-2 Manual are now classified as a modified channel. (Unknown channel types shown on Figures 2-2 through 2-6 are channels in elevations outside of the Program Renewal Area.) The two channel types are described immediately below.

Modified Channel: In general, the modified channel type includes channels that have been substantially altered from historical conditions. Some modified channels have had capital

improvement projects (CIPs), while others were constructed in conjunction with land development projects or to maximize developable land adjacent to a creek. Most modified channels have established design flow conveyance criteria and will be maintained to those criteria. However, many modified channels were not built according to an engineered design with established design flow conveyance criteria.

Modified channels typically include realigned, straightened, improved, or hardened reaches that have been designed to maximize the efficient flow of water to minimize erosion and flooding. These channels generally are grass--lined or concrete--lined (bed or bank) and may include a low-flow- channel. Some modified channels have the potential for habitat enhancement. Some modified channels already provide ecologic functions and values including features such as closed riparian woodland canopy and/or support habitat for special-status species.

Unmodified Channel: Unmodified channels have not been substantially altered through human intervention (to Valley Water's knowledge) and are generally similar in form and location to the channel under historic conditions. Unmodified channels may have small areas of modification, including bridges, outfalls, culverts, gauges, or other appurtenant structures. Unmodified channels are usually in areas without other types of flood protection measures and generally occur in the foothills or higher elevations of the Program Renewal Area.

Some modified channels and unmodified channels provide inherent ecological values. Mature riparian woodland canopies and older native trees occur along many unmodified channels and some modified channels. Grassy ruderal vegetation, grasslands, and adjacent woodlands provide habitat for nesting birds and other wildlife.

Channel Ownership

Valley Water generally performs routine maintenance work where it owns property in fee title, has an easement, or has maintenance obligations pursuant to effective rights of entry, licenses, and agreements. However, urgent flood protection work may need to be performed on other public or private property where a public purpose is endangered. Occasionally, maintenance activities not subject to SMP mitigation requirements may occur on other public or private property generally for stream stewardship purposes. In cases where maintenance work is anticipated to occur in areas where no fee title or easement property rights exist, Valley Water may acquire new property rights through acquisition of fee title or easements during the course of the Program Renewal and those lands may be managed under the SMP.

Under circumstances where maintenance is anticipated to occur in areas where Valley Water has no fee title or existing easements, and Valley Water does not plan on acquiring new property rights, maintenance work would be coordinated with the adjacent property owner under the appropriate license or agreement.

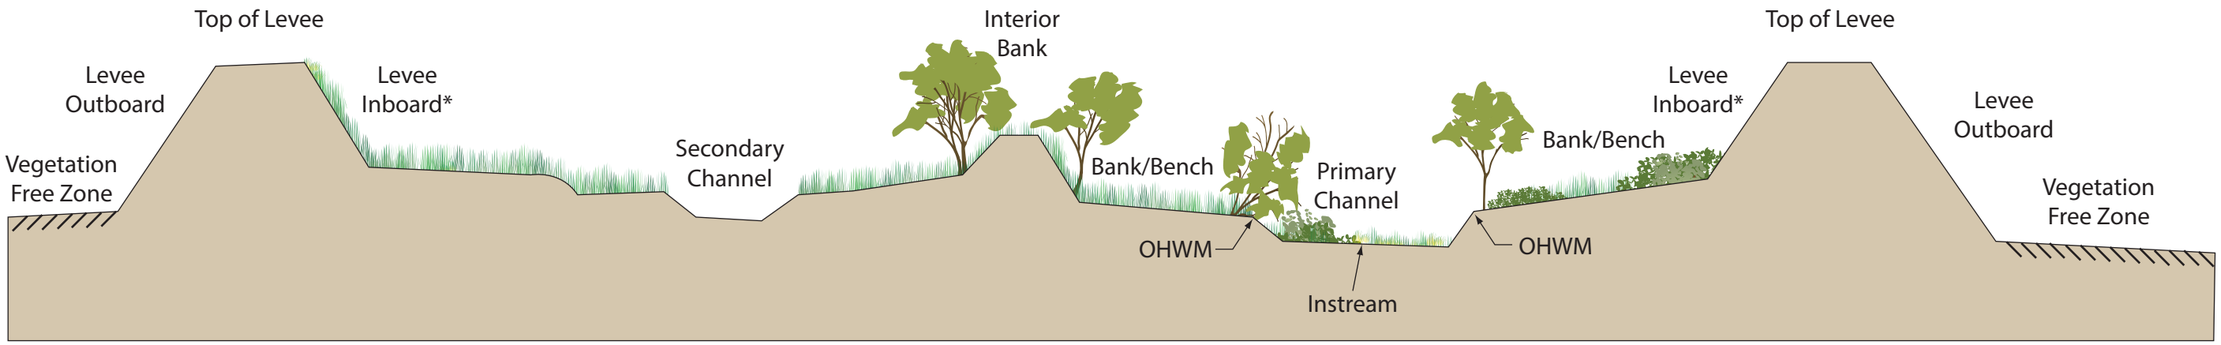
Figure 2-8
Representative Unmodified Channels



Note 1 - for flood control channels that include engineered levees, the upper bank portion of this typical cross section is analogous to the inboard levee. Many SCVWD levees also have a visible outboard slope that slopes outside and away from the channel to the adjacent land.

Note 2 - the areas in the typical cross-section identified as "bank" or "bench" are typically combined into a single geographic area type "bank/bench" for the purposes of SCVWD maintenance work projections.

MONTROSE ENVIRONMENTAL

Figure 2-9
Example of Valley Water-Maintained Channel

*Although in some instances vegetation exists at levee inboard locations, for federally-constructed flood protection projects for which SCVWD is the local sponsor (and therefore responsible for maintenance), the U.S. Army Corps of Engineers (USACE) has indicated that vegetation-free zones should exist at levee inboard locations to maximize accessibility for inspection and maintenance (unless the local sponsor applies for and receives a vegetation variance from the USACE).

2.6 OVERVIEW OF PROGRAM RENEWAL APPROACH

2.6.1 WORK AREA PROJECTIONS AND ANNUAL WORK PLAN

Based on the work performed during the 2012-2022 period, Valley Water has developed projections for work reasonably anticipated to occur over the duration of the Program Renewal (2027-2036). The estimated work projections identify the potential creek and maintenance activities by watershed. Although general maintenance needs have shown a relatively consistent pattern historically, projections of future stream maintenance activities are not intended to represent the exact extent or volume of work that may occur.

Actual stream maintenance activities vary from year-to-year, depending on weather and hydrologic conditions, frequency, and extent of past maintenance activities, and budget/funding availability. Future maintenance needs may occur, consistent with overall Program Renewal projections, but they may vary from the specific locations originally projected. Some maintenance activities, such as bank stabilization, cannot be reasonably projected because they happen in response to hydrologic events and a variety of site-specific factors.

Although the Program Renewal work projections provide an overview of expected maintenance needs over the period 2027–2036 (as described above), maintenance needs in any given year would reflect a variety of factors. Each year, Valley Water develops an annual work plan that identifies the locations, lengths, and areas for the given year's proposed maintenance activities. This information is then provided to the participating regulatory agencies in an annual Notification of Proposed Work (NPW). Additional details about the NPW are provided below in Section 2.9.1, "Annual Work Cycle."

2.6.2 ADAPTABILITY

As a program the SMP was designed and intended to be adaptable, and updated and modified over time as conditions require or improvements are found. One way the current renewal can improve the Program is by achieving the Program's maintenance goals together with identifying opportunities where more natural resources can be left undisturbed or enhanced. As conditions allow and technologies and environmental regulations evolve, keeping the Program adaptable can lead to making changes in work activities to further reduce potential impacts.

In addition, annual post-maintenance meetings, or "lessons learned" meetings, are planned so that Valley Water and resource agencies' staff can evaluate the effectiveness of both the resource protection and the maintenance methods used. These evaluations would be used to update BMPs and SMP processes to create a greater understanding of how to accomplish environmentally sensitive and fiscally-sound maintenance work.

2.6.3 MAINTENANCE GUIDELINES

Valley Water uses maintenance guidelines (MGs) to help assess, identify, and prioritize where stream maintenance actions are needed within and along modified channels. MGs analyze and evaluate channels under a range of sediment deposition and vegetative growth conditions. Using MGs, Valley Water compares existing sediment and vegetation conditions to previous conditions and evaluates how current conditions are reflected in simulated water surface elevations and roughness conditions. In this way, MGs are used to help assess the urgency of maintenance work and identify which creeks should be prioritized.

Note that MGs are not developed for all Valley Water channels; however, Valley Water has developed 40 MGs to date. In general, where Valley Water has defined flood protection Level of Service (LOS) targets based on engineering studies and design, MGs can be more definitive in their use. In cases where MGs do not exist for a modified channel, Valley Water relies on record drawings or channel reach dimensions and conducts hydraulic modeling to assess and prioritize maintenance actions.

Valley Water has not developed MGs for any unmodified channels. Maintenance work conducted in unmodified channels is kept to a minimum and is typically related to providing mandated or improved fire protection, ecological health improvements such as native riparian planting or removing invasive plant species, removing local blockages, or protecting public safety. While maintenance activities conducted on unmodified channels may have a flow conveyance benefit, work is typically not conducted to meet a defined flow conveyance target.

2.7 MAINTENANCE ACTIVITIES

The Program Renewal involves six main categories of work activities, all of which were included in SMP-2:

(1) Vegetation management,

(2) Sediment removal,

(3) Bank stabilization,

(4) Downed tree management (includes large woody debris),

(5) Management of animal conflicts, and

(6) Minor maintenance.

Descriptions of these maintenance activities are provided below, and additional details are provided in the SMP Manual Chapters 4-9 (**Appendix A**.)

2.7.1 VEGETATION MANAGEMENT

Vegetation management is intended to maintain access, flow conveyance, flood protection, and public safety in Valley Water's channels and right-of-way. Vegetation management is also conducted to reduce fire fuel loads and wildfire risk, preserve the structural integrity of flood protection facilities, and provide inspection visibility and access to Valley Water facilities. Vegetation management may also be conducted to promote overall ecological health, improve habitat for sensitive species, maintain restoration sites, and promote stewardship.

Vegetation management activities conducted routinely throughout the Program Renewal Area include pruning, coppicing, vegetation and tree removal, herbicide application, mowing, grazing, mitigation site maintenance, and nonnative invasive plant management. A summary of Valley Water's primary vegetation management activities and where they typically occur is provided below.

Under the Program Renewal, Valley Water may remove invasive plant species described in Chapter 4 of the SMP Manual (Appendix A) through mechanical means, hand removal, and/or herbicide application as described in this section. Throughout implementation of the Program Renewal, Valley Water may add new species to the list of invasive plants targeted for removal. Example types of invasive plants species that would be removed include acacia (*Acacia*), cape weed (*Arctotheca calendula*), broom species (*Ulex europaeus, Spartium junceum,* and *Cystisus scoparius*), cape ivy (*Delairea odorata*), among many others (Table 4-2 in Chapter 4 of the SMP Manual contains a list of all of the invasive species to be removed under the Program Renewal). Invasive plants may be removed anywhere in the Program Renewal Area.

Pruning

Pruning refers to removal of select branches from trees or shrubs to improve tree structure and achieve a defined objective. Pruning may be conducted with mechanized and nonmechanized hand tools. Pruning typically takes place along maintenance roads, fences, access ramps, and levee slopes, public or private roadways, sidewalks, and around traffic or other signage. ~~although it~~ It may also occur in-channel or along terrace areas.

Pruning is typically conducted to ensure access to Valley Water facilities, protect infrastructure, maintain channel conveyance capacity, and for wildfire and public safety. Corrective pruning involves removing specific tree elements to promote long-term tree health or to prevent whole tree failure (e.g., decayed or diseased limb), and is typically prescribed by a certified arborist. Corrective pruning may be conducted anywhere along the stream.

Coppicing

Coppicing is the cutting of a woody plant to ground level. Coppicing may be used to create annual "sucker" growth that may be used as cutting material for direct installation in revegetation projects. The plants that are chosen might typically be targeted for complete removal (e.g., near bridges) but instead are coppiced routinely as a propagule source. Typical

species include willows, mulefat, and poplars. After the tree is cut back to the ground, rather than treating the remaining stump with herbicide, the tree is instead left to re-sprout and provide an ongoing cutting source.

Coppicing may also be used as a technique for fire resilience to reduce the aboveground fuel load. As fire is generally suppressed in the urban areas maintained under the SMP, fuel loads can become unnaturally large, leading to the potential for larger, more destructive fires. When used for fire resilience, typical species for coppicing may also include native shrubs such as coyote brush. Following coppicing for fire resilience, rather than treating the remaining stump with herbicide, the tree or shrub is left to resprout and grow. Coppicing for fire resilience is an alternative to complete removal that promotes a healthy native plant-dominated riparian ecosystem.

Select trees within each major watershed in the Program Renewal Area may be dedicated to this activity. This work activity typically involves use of hand-held and small mechanical tools.

Vegetation Removal

Vegetation removal refers to the removal of woody and herbaceous vegetation less than 6 inches dbh. This work occurs throughout the channel cross-section, including but not limited to instream and immediate overstory areas, stream banks, levees, access roads, pedestrian paths, outboard areas, and at bridges and culverts. This work is typically performed using small hand tools or mechanized tools. Herbicide may also be applied to treated areas to prevent regrowth. Where MGs exist for a channel, the MGs may guide vegetation removal work that is needed on a project-by-project basis.

Over the 10-year Program Renewal period, Valley Water estimates that approximately 140.7 miles of vegetation removal work below top of bank would occur between 2027 and 2036. **Table 2-1** summarizes the total mileage of channel reaches where some amount of vegetation removal work below top of bank would occur by watershed. This table also identifies how much of the work reaches estimated for 2027-2036 would be in channel areas where past vegetation removal work was not previously projected under SMP-1. These "new" channel areas also indicate areas where PMAs have not been established yet. As described under Section 2.10.4, "Compensatory Mitigation" below, Valley Water will seek to establish new PMAs within these vegetation removal reaches as part of the Program Renewal compensatory mitigation package.

Table 2-1. Projected Reach Lengths of Vegetation Removal Below Top of Bank, 2027–2036

Watershed	2027–2036 Reach Lengths of Total Projected In-Channel Vegetation Removal (miles)*	Work Reaches for 2027–2036 Outside of PMAs (miles)**
Santa Clara Basin		
Lower Peninsula	57.3	39.9
West Valley	59.7	34.5

Watershed	2027–2036 Reach Lengths of Total Projected In-Channel Vegetation Removal (miles)*	Work Reaches for 2027–2036 Outside of PMAs (miles)**
Guadalupe	57.8	33.0
Coyote	77.8	60.7
Pajaro Basin		
Pajaro	58.7	27.2
Total	311.3	195.2

* The values shown here include the mileage of channel reaches where some amount of in-channel vegetation removal work is projected to occur between 2027 and 2036. However, the actual work lengths would be much smaller. The overall amount of actual in-channel removal work is anticipated to be 140.7 miles.

** The values shown here include the mileage of channel reaches where some amount of in-channel vegetation removal work is projected to occur outside existing PMAs between 2027 and 2036. The actual length of in-channel vegetation removal work that would occur outside PMAs would be less than the mileage listed in the table.

Tree Removal

Tree removal refers to the removal of any tree greater than 6 inches dbh. Tree removal may be necessary to provide channel conveyance capacity, improve site access, address wildfire safety or public health concerns, and/or improve the ecological health of the stream. Tree removal work involves removing the aboveground portions of a tree using mechanized or nonmechanized hand tools and may be followed by cut-stump treatment using herbicides to prevent regrowth. As part of the Program Renewal, tree removal work has been expanded to include removal of trees greater than 12 inches dbh.

While not previously covered under SMP-2, removal of hazard trees has been incorporated into the Program Renewal. Removal of hazard trees may be needed to ensure public safety along or adjacent to Valley Water channels, access roads, and ramps. Hazard trees may include dead or dying trees, dead parts of live trees, or unstable live trees (due to structural defects or other factors) that are within striking distance of people or property (a target).

Valley Water's preference is to first thin or prune trees before considering tree removal. However, when tree removal is necessary based on a careful evaluation conducted by Valley Water staff, native trees are given a higher level of consideration for preservation than nonnative trees unless a public safety issue is present. Valley Water will compensate for tree removal where required within the riparian habitat (see Section 3.4, "Biological Resources," for a discussion of riparian tree removal). Chapter 4 of the SMP Manual (Appendix A) describes Valley Water's tree removal activities and considerations in detail.

Herbicide Application

Herbicides are used in conjunction with mechanical and hand vegetation suppression methods to ensure channel conveyance capacity, maintain access to Valley Water facilities, ensure public and wildfire safety, maintain revegetation sites, manage invasive plants, and protect infrastructure and ecological health. Herbicides are used only when alternative

methods such as mowing, hand removal or grazing are determined to be ineffective or inefficient to meet the needs of a site.

Herbicide application activities occur in Valley Water channels, access ramps, and on terrace areas, as well as upper and lower maintenance roads, fence lines, and levee slopes. In-channel herbicide application may use a hose and handgun sprayer, backpack unit, or cut-stump application method for smaller and more targeted areas. On access roads, herbicides are applied from a truck-mounted boom, handgun, or backpack (e.g., used around gates and curves) as needed, to control weeds, ensure maintenance access, and provide or maintain firebreaks. The booms have multiple nozzles that are specifically calibrated to provide the dosage and spray pattern appropriate to the application area. To manage invasive plants, herbicide application methods such as basal bark treatment, frill-and-spray, and trunk injection may also be used in addition to the methods listed above.

Valley Water continually works to minimize pesticide use as much as is practical. Valley Water uses Category III and IV herbicides which are the least toxic chemical herbicides designated by the U.S. Environmental Protection Agency (USEPA), with the exception of triclopyr-choline and paraffinic oil, which are Category II. Valley Water pesticide use is consistent with the California Department of Pesticide Regulation (CDPR) and court orders related to protections for threatened and endangered species, including USEPA injunctions[2] (refer to **Figure 2-11** to see Program Renewal Area subject to pesticide injunctions).

Table 2-2 summarizes the projected amounts and types of herbicides that would be used between 2027 and 2036 in comparison to the projected volumes for the SMP-2 planning period and the actual amounts used between 2014 and 2020. Valley Water estimated that some amount of aquatic herbicide application would be needed along 225 miles of channel. Note that Valley Water staff would conduct localized targeted application (i.e., spot spraying) along these routes rather than continuous spraying across 225 miles of channel.

Herbicides are applied by licensed applicators using best methods to minimize overspray, drift, and overall herbicide use. All herbicide applications are made under the direction of a licensed Pest Control Advisor and a written pest control recommendation.

[2] Pesticide use in the Program Renewal Area is subject to two federal court-ordered injunctions: Injunction 1 (Center for Biological Diversity vs. USEPA ((Case No. 02-1580-JSW [JL])), which requires placement of a buffer area around certain habitats of the California red-legged frog (including habitat in the Program Renewal Area) that disallows use of certain pesticides within those habitats and buffer zones (Valley Water will not be using these particular pesticides) and Injunction 2 (Center for Biological Diversity vs. USEPA ((Case No. 07-2794-JCS [N.D. Cal])) which requires preparation of a schedule by which USEPA will review the registrations of pesticides containing any of 75 pesticide active ingredients for their potential effects to one or more of 11 federally listed threatened or endangered species in eight counties around the San Francisco Bay area. The injunction also identifies interim pesticide use limitations intended to reduce exposure to the 11 species during the time USEPA is assessing these pesticides and consulting with the USFWS, as appropriate.

Table 2-2. Summary Comparison of Program Renewal Annual Herbicide Projections and SMP-2 Projections and Actual Amounts Used

Active Ingredient	Usage	SMP-2 Projected Annual Use	SMP-2 Actual Annual Use (2014-2020)	Program Renewal Projected Annual Use
Upland Areas				
Glyphosate	Post-emergent	1,310 gal	536 gal	600 gal
Triclopyr	Post-emergent	6 gal	2 gal	6 gal
Aminopyralid & triclopyr	Post-emergent	N/A	50 gal	300 gal
Clopyralid	Post-emergent	N/A	N/A	4 gal
Ethyl oleate	Non-ionic surfactant	278 gal	N/A	100 gal
Isoxaben	Pre-emergent	1,695 lb	264 lb	500 lb
Dithiopyr	Pre-emergent	N/A	597 lb	600 lb
Aminopyralid	Pre-/post-emergent	N/A	N/A	200 gal
Aminopyralid & florpyrauxifen-benzyl	Post-emergent	N/A	N/A	200 gal
Aquatic				
Glyphosate	Post-emergent	932 gal	387 gal	500 gal
Imazapyr	Post-emergent	N/A	N/A	232 gal
Imazamox	Post-emergent	N/A	N/A	100 gal
Triclopyr-choline	Post-emergent	N/A	N/A	100 gal
Ethyl oleate	Non-ionic surfactant	310 gal	134 gal	210 gal
Paraffinic oil	Non-ionic surfactant	N/A	N/A	100 gal

Notes: gal = gallons, lb = pounds; N/A = not applicable.

Mowing

Valley Water routinely mows ruderal vegetation growing along access roads, terraces, outboard areas, levees, channel slopes, floodplains, and fence lines to provide visual access for facility inspections, allow vehicle equipment/maintenance access, and to maintain flow conveyance or fire safety. Except when performed for flow conveyance, mowing is conducted in accordance with local fire code requirements~~, which require that all weeds and grasses be maintained below 6 inches in height for 10 feet laterally on both sides of access roads.~~ Mowing is also conducted to maintain 30 feet of vegetation clearance around structures where Valley Water has land rights. In some cases, mowing may be required for flow

conveyance, as may be specified in an Operations and Maintenance Manual for a capital flood protection project.

This work is conducted either manually with handheld equipment or through mechanical mowing. Under the Program Renewal, Valley Water anticipates mowing 1,000 acres of land annually between 2027 and 2036.

Grazing

Goat grazing is conducted in limited circumstances to control grasses and herbaceous weeds growth and to reduce fire hazards or to maintain flow conveyance on floodplains where Valley Water has land rights. Before grazing commences, a Valley Water biologist evaluates a targeted area to be grazed to identify sensitive resources including wetlands, special-status plants, wildlife, and other aquatic resources. Sensitive resources and vegetation to be preserved are fenced off as a protective measure. Grazing is excluded from wetted channels, wetlands, and other aquatic resources. Once fencing has been installed, a herd is placed on a parcel.

Invasive Plant Management

Controlling the spread of invasive plant species is critical to improving the ecological health of Valley Water's streams and watersheds. Invasive plants tend to spread aggressively, negatively altering resource allocation regimes, wildlife behavior patterns, soil stability and water quality, resulting in degraded habitat quality and ecological value. In addition, invasive plants can exacerbate flooding and fire danger, undermine structural assets, and obstruct access to roads, levees, and trails.

Valley Water is in the process of developing a countywide Integrated Invasive Plant Management Program (IIPMP). The IIPMP will include a unified strategy for invasive plant control across all Valley Water facilities and programs. It is anticipated that there may be a period of transition between the Program Renewal in 2027 and the completion of the countywide IIPMP plan. During this interim period, Valley Water will continue invasive plant management work under the SMP and respond to newly identified invasive plant populations through the interim guidelines described in Chapter 4 of the SMP Manual (Appendix A). Once the countywide IIPMP plan is completed, some aspects of this plan will be implemented through the Program Renewal. These will include invasive plant management actions in the Program Renewal Area, including actions in or on creeks, riparian areas, access routes, infrastructure, and immediately associated lands.

Previously under SMP-2, Valley Water also used invasive plant management and removal to provide mitigation to program impacts caused by routine maintenance. Based on feedback from participating regulatory agencies, invasive plant management activities that target removal of invasive species are no longer a preferred mitigation approach. However, such activities will continue to occur under the SMP as a stewardship action and as removing invasive species may be required to gain access to Valley Water facilities or reduce overall instream vegetation. Removing invasive plants is now considered a "neutral" activity in that its removal will no longer provide mitigation offsetting credit, but such activities would also

not be considered as negatively impacting the riparian zone ecology or require additional mitigation.

2.7.2 SEDIMENT REMOVAL

Sediment removal involves the mechanical removal of excessive sediment that has deposited within a flood protection channel. Sediment removal is required when accumulated sediment reduces a channel's flow conveyance capacity, prevents facilities or appurtenant structures from functioning as intended, impedes fish passage and access to fish ladders, and/or blocks access to Valley Water facilities. Sediment is removed to restore channel capacity and minimize the flood risk in accordance with the existing channel design (as available). Sediment removal under the Program Renewal does not include increasing a channel's cross-sectional area or capacity beyond the as-built channel design or maintenance baseline.

Sediment to be removed from Valley Water's channels and facilities would be assessed according to the Sediment Characterization Plan established for the SMP. Sediment characterizations would be conducted to determine the physical and chemical properties of the removed sediment using continuous core, discrete sampling, and residual sampling methods.

Collected sediment that meets wetland reuse criteria could be transferred to the South Bay Salt Pond Restoration (particularly Pond A8) to support tidal habitat restoration efforts. Sediment that does not meet these standards but meets standards for landfill disposal would be disposed at a local landfill. Sediment that exceeds hazardous waste criteria would be disposed at an appropriate hazardous waste facility (e.g., Kettleman Hills hazardous waste landfill). Valley Water may also dispose of sediment in upland reuse sites. Sediment from SMP projects that is being reused will meet the sediment standards of the site where it is being reused.

Sediment removal is a projected work activity. However, the estimated projections may not reflect the actual maintenance work conducted. The annual sediment removal need varies yearly according to precipitation, hydrologic, and geomorphic conditions in the Program's channels and watersheds. Over the 10–year Program Renewal period, estimated sediment removal activities include 58 miles of creeks or channels in the Program Renewal Area.

Table 2-3 below identifies the total length of channel reaches where some amount of sediment removal work is anticipated to occur by watershed. Table 2-3 also shows how much of the work reaches estimated for 2027-2036 would be in channel areas where past sediment removal work was not previously projected under SMP-1. These "new" work reaches also indicate areas where PMAs have not been established yet. As described under Section 2.10.4, "Compensatory Mitigation" below, Valley Water will seek to establish new PMAs for these sediment removal areas as part of the Program Renewal compensatory mitigation package.

Table 2-3. Projected Reach Lengths of Sediment Removal Work, 2027–2036

Watershed	Projected Sediment Removal Work Length	Projected Sediment Removal Work Length Outside of PMAs

	2027–2036 (full reaches) (in miles)*	2027-2036 (full reaches) (in miles)**
Santa Clara Basin		
Lower Peninsula	6.8	2.5
West Valley	11.6	5.7
Guadalupe	11.4	1.9
Coyote	20.7	17.8
Pajaro Basin		
Pajaro	26.7	22.5
Total	77.2	50.4

* The values shown here include the total mileage of channel reaches where some amount of sediment removal work is projected to occur between 2027 and 2036. However, the actual work lengths within the reaches would be less as the work will not occur along the entire reach lengths. The total sediment removal length is estimated to be 58 miles, and this is less than the total length of reaches where sediment removal is anticipated to occur. The 58-mile length across the 5 Valley Water watersheds is used as the basis for impact assessment in this EIR.

** The values shown here include the mileage of channel reaches where some amount of sediment removal work is projected to occur outside existing PMAs between 2027 and 2036. The actual length of sediment removal work that would occur outside PMAs would be less than the mileage listed in the table as these values in the table indicate the total reach lengths.

2.7.3 BANK STABILIZATION

Bank stabilization involves the repair and stabilization of eroding channel banks, beds, and levees to re-establish a stable bank, prevent overbank flooding, protect the channel's conveyance capacity, minimize additional sediment input into the channel, and reduce the risk of further erosion. Based on the maintenance work conducted from 2014 to 2020, Valley Water stabilized a total of 1.7 miles of channel banks. This equates to an average of about 0.24 mile of channel bank or levee repair per year.

Although bank stabilization is routine and expected, the specific work locations are not certain until after each winter season. As a result, this type of maintenance (unlike sediment removal and vegetation management) is not a work activity with annual projections. Rather, bank stabilization maintenance needs are assessed annually on an as-needed basis. Mitigation for impacts of bank stabilization projects, if any, is also determined on an annual basis depending on the identified work need and potential resources affected.

The list of suitable SMP bank stabilization treatments has generally not changed since the last program update (SMP-2). These techniques are described in detail in the SMP Manual Attachment D (Appendix A) and summarized in **Table 2-4**, which identifies the SMP's 13 bank stabilization treatments (and variations) and describes whether the technique uses softscape, hardscape, or a combination (hybrid) use of both soft and hard elements. Site specific conditions will determine which method is the most appropriate for the given situation. Valley Water favors the use of soft bank stabilization approaches that use softer bio-technical approaches and first considers these methods for use prior to consideration of more hardened techniques.

Table 2-4. Bank Stabilization Methods

ID No	Method	Bank Stabilization Treatment Technique(s)
1	Earth Repair	Soft
1A	Earth Repair with Buried Rock	Soft
1B1	Earth Repair with Rock Base Vegetated	Hybrid
1B2	Earth Repair with Rock Base Not Vegetated	Hard
2	Live Construction	Soft
2A1	Live Construction with Boulder Base	Hybrid if rock area is vegetated
2A2	Live Construction with Boulder Base	Hard if rock area is not vegetated
2B	Live Construction with Log Base	Soft
3	Contour Wattling	Soft
3A1	Contour Wattling with Boulder Base	Hybrid if rock area is vegetated
3A2	Contour Wattling with Boulder Base	Hard if rock area is not vegetated
3B	Contour Wattling with Log Base	Soft
4	Brush Mattress (Brush Layering)	Soft
4A1	Brush Mattress (Brush Layering) with Boulder Base	Hybrid if rock area is vegetated
4A2	Brush Mattress (Brush Layering) with Boulder Base	Hard if rock area is not vegetated
4B	Brush Mattress (Brush Layering) with Log Base	Soft
5	Surface Matting (Erosion Mats)	Soft
5A	Surface Matting (Erosion Mats) with Boulder Base	Hybrid
5B	Surface Matting (Erosion Mats) with Log Base	Soft
6	Add Rock to Invert	Hard
6A	Rock Cross Vanes	Hard
6B	Root Wads and Boulders	Hybrid
6C	Live Log Crib Walls	Soft
6D	Log Revetment	Hybrid
6E	Bendway Weirs	Hard
7	Cellular Confinement System	Hard
8	Rock Blanket	Hard

ID No	Method	Bank Stabilization Treatment Technique(s)
8A	Boulder Revetment	Hard
8B	Boulder Revetment with Soil and Vegetation	Hybrid
9	Articulated Concrete Blocks	Hard
9A	Articulated Concrete Blocks with Planted Areas	Hybrid
10	Concrete Crib Walls	Hard
11	Sacked Concrete	Hard
12	Gunite Slope Protection	Hard
13	Soldier Piles	Hard

2.7.4 DOWNED TREE MANAGEMENT

Valley Water conducts downed tree management activities as fallen trees, logs, or other debris increases hydraulic roughness either directly or by capturing and trapping additional debris and vegetation. The increase in hydraulic roughness due to downed trees and other debris can result in reduced conveyance capacity. The SMP considers large woody debris (LWD) as downed trees with a diameter of at least 12 inches and a length of at least 6 feet that have fallen below the Ordinary High Water Mark[3] (OHWM) in an anadromous salmonid creek (listed in **Table 2-5** below).

Downed trees that meet the definition of LWD may provide an important ecological role in anadromous salmonid creeks in the Program Renewal Area (e.g., shading, fish refugia). In situations where a downed tree is LWD, Valley Water evaluates the tree for its potential to cause or increase erosion, flooding, reduced channel conveyance capacity, bank failure, or potential to negatively impact a facility (e.g., bridge or culvert). If erosion, flooding risks, and debris capture are unlikely and if the LWD will not damage nearby infrastructure, Valley Water seeks to retain the LWD in anadromous creeks as a habitat feature along the channel. However, if LWD is deemed to pose a potential flood risk or likely to damage infrastructure, Valley Water may reposition, modify, cut, or remove it to maintain channel conveyance capacity or infrastructure integrity.

Table 2-5. Steelhead Distribution in Anadromous Salmonid Creeks Within the Program Renewal Area

Creek / River	Upper Limit of Steelhead Distribution
Central California Coast Steelhead	
Alamitos Creek	Almaden Dam

[3] While OHWM is used by federal resource agencies and bankfull is used by California Department of Fish and Wildlife (CDFW), these metrics generally align when determined based on field indicators. Valley Water staff will make determinations of OHWM/bankfull based on field indicators.

Creek / River	Upper Limit of Steelhead Distribution
Arroyo Aguague*	Falls upstream from confluence with Upper Penitencia Creek
Calero Creek	Calero Dam
Coyote Creek	Leroy Anderson Dam
Guadalupe River/Creek	Guadalupe Dam
Los Gatos Creek	Camden Avenue Drop Structure
Los Trancos Creek*	Approximately 0.4 mile north of headwaters
San Francisquito Creek	Searsville Dam
Stevens Creek	Stevens Creek Dam
Upper Penitencia Creek	Cherry Flat Dam
South-Central California Coast Steelhead	
Bodfish Creek	Bodfish Creek Falls
Cedar Creek*	Approximately 3 miles north of Cedar Creek Boulder Falls #2
Little Arthur Creek*	Approximately 5 miles upstream of the confluence of Uvas Creek
Llagas Creek	Chesbro Dam
Pacheco Creek*	North Fork Dam
Pajaro River	Steelhead occur in all portions of the creek within Santa Clara County
Pescadero Creek*	Headwaters
Tar Creek*	Southern end of Castro Valley approximately 1.8 river miles from headwaters
Uvas/Carnadero Creek	Uvas Dam
South Fork Pacheco Creek*	South Fork Pacheco Creek Boulder Falls

* Although work is not expected on these creeks, they are within the Program area and are therefore included here.

2.7.5 MANAGEMENT OF ANIMAL CONFLICTS

Animals can damage Valley Water facilities by burrowing into levees or channel banks, foraging on revegetated mitigation sites, and/or interfering with Valley Water's work activities. To protect the structural integrity of Valley Water's facilities and to reduce conflicts with species living in sites where work is needed, maintenance work is conducted to repair Valley Water facilities damaged by animals.

Management of animal conflicts refers to the use of avoidance tactics, biological control, physical alterations, habitat modification, live trapping, and fumigation to reduce conflicts between Valley Water facilities and local species. Valley Water uses a range of approaches to

maintain a safe work site environment, including the use of biological controls, levee compaction, filling burrows with soil or slurry, installing physical barriers like chain-link fencing above OHWM, and habitat modification through vegetation management, bird nest deterrence, nonlethal trapping, and fumigation.

As part of the Program Renewal, this category of work has been expanded to include bat exclusion activities within the Upper Llagas Creek Flood Protection Project's high-flow bypass tunnel. Bat exclusion measures may include installing one-way mesh exits that allow bats to leave but not return to the tunnel.

2.7.6 MINOR MAINTENANCE

Minor maintenance includes fence repairs, access road maintenance, trash and debris removal, removal of small downed trees (not in a salmonid creek or less than 12 inches in diameter and less than 6 feet), minor sediment removal (25 cubic yards or less), ongoing maintenance of restoration sites, stream gauge maintenance, minor erosion repairs above OHWM, and other minor maintenance activities needed to maintain Valley Water facilities. This category of work also includes in-kind replacement of structures within the same footprint (i.e., culverts, pipes, creeks-in-pipe, replacement of concrete linings) and in-kind bank repairs if the hardscape and softscape facilities are replaced with similar materials, respectively.

As part of the Program Renewal, the category of minor maintenance has been expanded to include

- Trash boom maintenance. Valley Water manages two trash booms in San Jose (Thompson Creek upstream of Tully Road and Lower Silver Creek downstream of King Road) and installed two trash booms in Palo Alto (Adobe Creek at Highway 101 and Matadero Creek at Highway 101), which are maintained by the City of Palo Alto. Routine trash boom maintenance includes cleaning the facilities two to three times per year by hand or using cranes with a basket attachment or claw.
- Routine work at maintenance yards. Routine work at maintenance yards includes minor grading, maintenance of stormwater pollution prevention measures, stockpiling materials such as boulders, and similar housekeeping activities.
- Floodwall maintenance. Floodwall maintenance may include activities such as graffiti removal, addition of protective coatings, and periodic repairs to prevent erosion.
- Maintenance of the Palo Alto Flood Basin tide gates (located at the confluence of Matadero Creek and Adobe Creek). Maintenance of the Palo Alto Flood Basin tide gates may include removal of accumulated debris and trash; cleaning the gates; in-kind replacement of minor components that have become corroded or worn; and periodic repainting for corrosion protection.
- Maintenance of fish ladders that are not associated with a diversion, and maintenance of passive flood barriers (e.g., along Lower Penitencia Creek). Fish ladder maintenance involves removing accumulated sediment, debris, or algal growth, as well as minor in-kind repairs such as repairing loose, broken, or missing components. Maintenance of

flood protection barriers may include lubrication; changing hydraulic fluids and filters; removing dirt and debris via hand removal, power washer, or vacuum; and in-kind replacement of parts.

For additional details about Valley Water's minor maintenance activities, see Chapter 8 of the SMP Manual (Appendix A).

2.8 SUMMARY OF PROGRAM RENEWAL WORK PROJECTIONS

Table 2-6 below summarizes the Program Renewal work projections for Valley Water's primary maintenance activities and compares those projections to SMP-1 and SMP-2 work projections and to the actual work amounts during portions of the SMP-1 and SMP-2 planning periods. In general, the Program Renewal work projections are similar to or less than past SMP-1 and SMP-2 work projections. Note that the projected aquatic herbicide application amount (227 miles) is substantially lower than what was projected for SMP-2 (846.9 miles). Valley Water has reduced the annual limit for pre-emergent herbicides based on lessons learned from SMP-2 and the need to apply substantially less pre-emergent herbicide than was anticipated in SMP-2.

Table 2-6. Summary of Program Renewal Projected Activities and Actual Work Completed

Primary Maintenance Activities	Extent of Activities (Miles)				
	SMP-1 Projected Activities (2002-2012)	SMP-1 Actual Work Completed (2002-2009)	SMP-2 Projected Activities (2012-2022)	SMP-2 Actual Work Completed (2014-2020)	Program Renewal Projected Activities (2027-2036)
Vegetation Management – In-Channel Removal	60	46.7	150.9	76.4	140.7
Vegetation Management – Aquatic Herbicide Application	183	172.9	846.9	147.6	227
Sediment Removal	58	32.3	42.8	33.4	58
Bank Stabilization	N/A	7.5	N/A	1.7	N/A

2.9 IMPLEMENTATION AND OVERSIGHT

2.9.1 ANNUAL WORK CYCLE

SMP maintenance activities occur on an annual cycle and generally occur in three phases.

- Phase 1. In the winter and early spring, maintenance needs are assessed and prioritized, the annual maintenance work plan is developed, and regulatory agencies are notified through an NPW document submitted by Valley Water.
- Phase 2. During the summer and early fall, maintenance projects are implemented.
- Phase 3. Toward the end of the year and into the following winter, the annual summary report (ASR) is developed, distributed to regulatory agencies, and Valley Water staff and managers typically meet with regulatory agencies to review the past year's work.

These work phases are described in more detail below.

Phase 1: Annual Maintenance Activity Identification and Development of NPW

During the winter and early spring, Valley Water staff would finalize its review of flood protection facilities and channels inspected to identify and prioritize maintenance needs. Maintenance work may be proposed either as part of the annual NPW or as identified throughout the year by individual Valley Water staff work orders.

By April 15 of each year, Valley Water would notify the relevant regulatory agencies (i.e., those agencies with jurisdictional authority or oversight) of the year's planned maintenance projects. The relevant regulatory agencies would be provided with information describing proposed maintenance activities, locations, natural resource conditions, and any other key resource issues in the NPW. The NPW would describe which ground-disturbing maintenance activities would result in impacts on wetlands or waters of the U.S. and state as well as riparian habitat. The NPW also describes in detail Valley Water's proposal for providing compensatory mitigation for those impacts and may include one or more options described in Section 2.10.4, "Compensatory Mitigation," below.

Some activities, such as most minor maintenance projects or opportunistic invasive plant removal projects, do not require advance notification through the NPW process. In these cases, appropriate resource protection measures and BMPs would be identified, and work would be allowed to proceed.

In contrast, for other maintenance activities, a more detailed review process would occur and may include a site assessment and/or engineering evaluations. These activities would be reviewed to verify they were covered under the long-term regulatory clearances provided in conjunction with the Program Renewal. If the work was not covered by the Program Renewal, the appropriate Valley Water project development process would be followed and may include individual CEQA review and project-specific regulatory permits or clearances. For covered activities, appropriate resource protection measures and BMPs would be identified and added to the work order. For maintenance activities requiring compensatory mitigation, mitigation needs would be planned and described in the NPW. Pre-maintenance meetings would be held with appropriate Valley Water staff to discuss site-specific requirements, environmental constraints, and applicable BMPs. It may be necessary for Valley Water to submit a subsequent NPW in a given year, if late-season rains occur or other factors arise out of Valley Water's control.

Phase 2: Implementation of Annual Program Renewal Activities

Aside from minor maintenance activities (which can be conducted year-round), other Program Renewal maintenance activities would be implemented during the summer and fall season (as described below) or as described in the work order. Specific maintenance steps and methods are described in more detail below. In addition, field monitoring of maintenance work (e.g., inspections of BMPs) would occur for both sediment removal and bank repair activities. Field monitoring would include inspections of BMPs so that they would be effective in preventing adverse impacts to water quality and stream habitats.

In general, sediment removal, instream vegetation removal involving ground disturbance, management of animal conflicts involving ground disturbance, aquatic herbicide application, and bank stabilization work would be conducted between June 15 and October 15. If the fall season remains dry, work could continue until the first significant rainfall event and in accordance with the work windows outlined in Chapter 3 of the SMP Manual (Appendix A). A significant rainfall event is defined as local rainfall of 0.5 inch or greater within the watershed over a 24-hour period. Valley Water relies on weather forecasts to prepare for situations when significant rains are anticipated. In general, permits issued by regulatory agencies for the Program Renewal and/or mitigation requirements stemming from the CEQA analysis may also place additional limitations on work types and windows.

Phase 3: Annual Reporting and Review with Regulatory Agencies

At the end of each year's maintenance season, an ASR would be developed and submitted to the appropriate regulatory agencies. This report would include a summary of the year's maintenance projects, describing what activities occurred and where, a description and confirmation of the restoration and mitigation activities implemented, and other SMP updates as necessary.

Following submittal of the ASR, regulatory agency staff would be invited to meet with Valley Water staff for an annual "lessons learned meeting" to be held in February or March of each year to evaluate the effectiveness of both resource protection and maintenance methods used in the preceding construction season. The information discussed at these annual lessons learned meetings would be used to adaptively manage the BMPs and SMP processes to improve SMP effectiveness.

2.9.2 Maintenance Crew, Work Durations, Equipment, and Maintenance Methods

A vegetation management crew typically includes three to four Valley Water staff and is often supplemented by external skilled laborers, bringing the overall crew size to eight to 10 personnel. On rare occasions, two vegetation management crews work together on a site; in such cases, the maximum number of workers onsite is 16-20 workers. For larger maintenance projects (e.g., bank repairs), field operations construction crews typically include four Valley Water staff, but on occasion may include up to eight staff. Field operations crews may also, in some cases, be supplemented by up to 10 outside skilled laborers for activities such as encampment cleanup.

While some maintenance activities can be completed in a single day, more complex projects (e.g., large bank repair, vegetation management, or sediment removal projects) may require more than 30 days to complete. Vegetation management activities would require relatively short work times at any given location as maintenance crews typically cover a large area in a workday.

Maintenance activities would generally be conducted during daytime hours (between 6:30 a.m. and 4:00 p.m.) on weekdays. If maintenance activities do not involve the use of heavy equipment, they may begin as early as 6:00 a.m. Regardless, Valley Water would adjust work hours to ensure consistency with local noise ordinances.

The specific pieces of equipment used for the maintenance activities would vary depending on the facility and type of maintenance activity required. Below is a description of the typical types of equipment and work activities that would occur for each work category.

Vegetation Management

Vegetation management techniques would include pruning and hand removal, using small tools and hand-held equipment (chainsaws, weed-eaters), mechanical removal using light or heavy equipment, herbicide application, and grazing. Light equipment used for vegetation removal may include a disc attachment on a tiller to clear aboveground herbaceous plants on the upland parcels outside of stream banks, and flail mowers to cut weeds and other vegetation on the inside slope of some levees or stream banks. Heavy equipment that may be used for vegetation management could include a specialized amphibious tracked vehicle (e.g., Marsh Master®) with cutting attachments or a skidsteer, backhoe, or rubber-tracked excavator for removing material from the channel.

Where tree removal is necessary for equipment access, Valley Water staff would target nonnative trees for removal first. Removal of large branches from mature trees for equipment access would be evaluated carefully and avoided whenever possible. For tree removal work, the above-ground portions of a tree are typically removed using mechanized equipment or nonmechanized hand tools. Removed trees may then be cut stump-treated with herbicide to prevent regrowth.

For grazing activities, goats are typically used for nontargeted weed control. Before grazing work commences, a Valley Water biologist evaluates a targeted area to be grazed to identify sensitive resources. As a protective measure, fencing is installed around sensitive resources and vegetation to be preserved.

Sediment Removal

Sediment removal activities may require use of the following: excavators, long-reach excavators, bulldozers, scrapers, and front-end loaders. Water trucks may be used for dust control. Vacuum trucks may be used for removing sediment from pipes and culverts.

Compact loaders may also be used to remove sediment from within the channel where larger equipment will not fit on the access road. Compact loaders may push the excavated sediment up existing access ramps, where available. Where there is not existing access into the channel,

construction of a temporary access ramp may be required (described in BMP GEN-28, in **Table 2-10**). The sediment is then either placed directly into dump trucks parked on the access road or stockpiled at central locations along the channel for subsequent removal. Stockpiling of materials would occur as described in BMP GEN-26.

Where possible, equipment is operated from the top-of-bank above and outside of the channel from maintenance access roads. If water is present in the channel, a temporary dewatering or bypass system would be installed. Once the work area is dry or isolated from water flow, sediment may be removed from channels, debris or detention basins, culverts, or pipelines.

Bank Stabilization

For bank stabilization projects, equipment typically used include excavators, bulldozers, front-end loaders, compact track loaders, and soil compactors for bank grading and earth-moving activities, and water trucks for dust control. The staging of equipment would generally occur on adjacent access roads; soil and other bank repair materials are typically placed in previously disturbed areas (i.e., service roads, turn-outs). In some cases, bank stabilization projects may require the installation of temporary roads and ramps to access the work site. To the extent feasible, access roads and other previously disturbed areas are used for the staging of soil and bank stabilization materials.

Management of Animal Conflicts

Management of animal conflicts generally would be conducted using small tools and hand-held equipment. This would include establishing buffers and biological repellants, trapping, and fumigant applications (see Appendix A, Chapter 7for more details on methods).

Heavy equipment (e.g., excavators, compact track loaders, and soil compactors) may be used to modify habitat conditions and reduce or eliminate burrowing animals through surface compaction, filling of burrows with slurry~~, and tilling areas to destroy food sources~~.

All lethal control methods would be designed to comply with the County Agriculture Commission requirements and would be implemented using BMPs that would be designed to avoid or minimize effects on special-status species.

Minor Maintenance Activities

In general, minor maintenance activities would involve equipment described above for the work categories. Maintenance of passive flood barriers may require use of built-in hydraulic systems or mechanical equipment such as a crane or forklift. Additional information about specific implementation methods can be found in Appendix A, Chapter 8.

2.10 IMPACT AVOIDANCE AND MINIMIZATION MEASURES AND COMPENSATORY MITIGATION

2.10.1 PROGRAMMATIC IMPACT AVOIDANCE AND MINIMIZATION

The Program Renewal would incorporate the following overarching principles to protect natural resources and guide decision-making for stream maintenance activities and projects. Proposed program limits and BMPs (discussed in Section 2.10.3, "Program Limits and Best Management Practices" were developed to be consistent with these principles.

1. Avoid unnecessary intervention. Maintenance should only be done when it is determined to be necessary and appropriate to maintain conveyance, maintain the structural integrity of stream banks and beds, maintain access, protect public safety, or ecologically improve watershed ecosystems, streams, and/or other natural resources.

2. Consider the ecological system and its processes, including adjacent land uses, when determining maintenance necessity. If maintenance is necessary, then, before selecting sediment, vegetation or bank stabilization treatments, work to understand the channel system and its formative processes to know why the reach is functioning as it is. Established MGs are a method to document and centralize applicable information to be used to guide appropriate maintenance activities. Where channels are bordered by developed land uses, flood protection requirements may limit stream maintenance options. Maintenance activities will not increase the level of flood protection provided to surrounding lands as defined by as-built information for the reach or increase the dimensions of an unmodified channel.

3. Seek maintenance solutions that minimize impacts on the environment. Implementing BMPs, work windows, work activity program requirements, Program Renewal limits, and incorporating geomorphic approaches, when possible, can assist in minimizing impacts.

4. Integrate maintenance activities towards sustainability to reduce frequency of maintenance. The approach for channel maintenance should integrate effective activities that, in time, will reduce the overall need for continued maintenance support.

2.10.2 AVOIDANCE OF SERPENTINE HABITATS AND PAYMENT OF NITROGEN DEPOSITION FEES

Sensitive serpentine-associated plants and animal communities occur in the Program Renewal Area along the edges of the Santa Clara Valley floor and foothills. Serpentine plant communities in the Program Renewal Area support a unique assemblage of plant species, including serpentine-associated special-status species that are known to be present or could occur in the Program Renewal Area (see Section 3.4, "Biological Resources," for a list of plant species). Program Renewal activities will avoid maintenance activities in serpentine habitat areas.

Compliance with serpentine-related Valley Habitat Plan (VHP) conditions and payment of VHP impact fees for serpentine land cover types are not anticipated to be needed, as no direct impacts within serpentine habitats would occur. However, due to the sensitivity of serpentine habitats and the rarity of serpentine-associated special-status plants in the region, to ensure that any indirect impacts of Program Renewal activities on these species are reduced to less-than-significant levels, as an EIR mitigation measure (Mitigation Measure BIO-1) Valley Water will pay VHP nitrogen deposition fees through the Santa Clara Valley Habitat Agency's Voluntary Fee Payments Policy for VHP-covered (and non-VHP-covered) activities to reduce effects of nitrogen deposition from nitrogen emitted by maintenance vehicles and equipment. Section 3.4, "Biological Resources," further discusses the VHP nitrogen deposition fee payment pursuant to Mitigation Measure BIO-1.

2.10.3 PROGRAM LIMITS AND BEST MANAGEMENT PRACTICES

In an effort to minimize impacts resulting from maintenance activities, the Program Renewal includes the following limits:

- Coppicing would be limited such that no more than 20 percent overstory canopy removal is allowed in any stream reach, and at least 50 percent of the understory canopy of native vegetation would be retained.
- Removal of nonhazard trees 6-12 inches dbh would be limited to 2,000 live trees between 2027 and 2036. On an annual basis, this work would be limited to 400 live tree removals per year. For each project, the Program Renewal would allow no more than 20 percent overstory canopy removal in any reach, and at least 50 percent of the understory canopy of native vegetation would be retained.
- Removal of nonhazard trees greater than 12 inches dbh would be limited to 150 live trees between 2027-2036. On an annual basis, this work would be limited to 20 live tree removals per year. For each project, no more than 20 percent overstory canopy removal would be allowed in any reach, and at least 50 percent of the understory canopy of native vegetation would be retained. Removal of trees greater than 12 inches dbh is a new activity under the Program Renewal that was not included in SMP-2.
- The Program Renewal's in-channel and non-in-channel herbicide application limits are based on gallons/pounds of product and are summarized in **Tables 2-7** and **2-8** below. The per project limits would correspond to the product label restrictions per application.

Table 2-7. In-Channel Herbicide Use Limits, 2027–2036

Product	Average Annual Limits * (gallons)	10-Year Program Limits (gallons)
Aquatic Herbicide	932	9,320
Surfactant	310	3,100

Table 2-8. Non-In-Channel Herbicide Use Limits, 2027–2036

Type of Chemical	Average Annual Limits	10-Year Program Limits
Post-emergent Herbicide	1,310 gallons	13,100 gallons
Pre-emergent Herbicide	2,700 pounds	27,000 pounds
Surfactant	100 gallons	1,000 gallons

Note: The limits for pre-emergent herbicides represent an approximately 79 percent reduction in pre-emergent herbicide use from SMP-2 projections. Valley Water has reduced the annual limit for pre-emergent herbicides from 13,128 pounds per year to 2,700 pounds per year based on lessons learned from SMP-2 and the need to apply substantially less pre-emergent herbicide than anticipated under SMP-2.

- There is no limit to the number of sediment removal projects that may occur each year; however, a separation of 500 feet between sediment removal work sites is required and each project must comply with the quantitative objectives established by the MGs (where developed). Sediment removal in modified channels would not exceed 5,000 linear feet for individual projects. Sediment removal in unmodified channels must be associated with a facility or human-made structure (i.e., bridge, outfall, gauge, or grade control) and would not exceed 300 linear feet for individual projects. Valley Water may submit waiver requests for sediment removal projects that exceed the per-project limits; such requests must be reviewed and approved by appropriate regulatory agencies before commencing work.
- There is no limit to the total number of bank stabilization projects that may occur each year. The annual limit is one linear mile of channel; however, hardscape areas that are replaced with softscape or hybrid methods may exceed the per-project limits and will not be counted toward the annual maximum one-mile limit. In-kind bank stabilization projects will not be counted toward the annual maximum one-mile limit. For individual bank stabilization projects, limits by repair type include 500 linear feet for soft methods and 300 linear feet for hard and hybrid methods. No repair method would exceed 0.5 acre below OHWM for individual projects. A separation of 250 feet between bank stabilization repair sites is also required to ensure that each repair has independent utility. Valley Water may submit waiver requests for bank stabilization projects that exceed the per-project limits; such requests must be reviewed and approved by appropriate regulatory agencies before commencing work.
- For downed tree management activities in channels supporting anadromous salmonids, up to 200 cubic yards of LWD cutting and removal work would be allowed during the 2027-2036 period. This 10-year limit does not apply to downed tree removal activities required for fish passage or those associated with removal of debris jams/trash rafts as these efforts would result in a water quality benefit.
- Animal conflict management activities involving surface compaction and filling of burrows above OHWM would not exceed 42 miles during the 2027-2036 period.

- For minor maintenance activities, individual projects would not exceed 0.08 acre of wetland/riparian vegetation impacts. Project reporting is required for minor maintenance projects that result in 0.01 acre or more of wetland/riparian vegetation impacts or any activity where dewatering is performed. The annual limit for minor maintenance projects is 0.5 acre of wetland/riparian vegetation impacts. The 5-year program limit is 2 acres of wetland/riparian vegetation impacts and the 10-year program limit is 4 acres of wetland/riparian vegetation impacts.

In addition to the above-described program limits, Valley Water implements SMP BMPs, which include standard practices and impact avoidance measures that would minimize potential environmental impacts. BMPs presented at the end of this chapter in **Table 2-10** are also included in the SMP Manual (Appendix A). These measures are implemented prior to, during, and post maintenance operations.

BMPs are implemented to avoid or minimize impacts to water quality and other environmental resources and include measures and procedures to identify site or maintenance constraints, such as biological or cultural resource surveys. They protect and enhance existing habitat, protect maintenance workers and the public from equipment hazards, and provide specific and detailed guidance on vegetation management procedures, sediment removal activities, and bank stabilization techniques implemented by Valley Water. BMPs also include procedures for animal management activities and application of pesticides.

2.10.4 COMPENSATORY MITIGATION

The Program Renewal includes many impact avoidance and minimization approaches and measures that have been developed, implemented, and revised since the SMP was initiated in 2001. Additionally, the SMP includes several BMPs, specifically targeted to the Program's maintenance work activities to further avoid or minimize potential impacts. However, in instances where impact avoidance and minimization measures on their own are not adequate to offset potential Program impacts, the SMP includes a compensatory mitigation approach which builds on the 25-year history of providing compensatory mitigation as part of Valley Water's SMP. Valley Water provides on-going compensatory mitigation activities as part of the routine operation and implementation of the SMP. The compensatory mitigation approach is summarized in this section to provide a general understanding and context on how Valley Water's on-going mitigation activities were considered during the evaluation of potential Program impacts and the development of CEQA mitigation measures within this DEIR. The following paragraphs briefly describe the compensatory mitigation approaches used during SMP-1 and SMP-2, and the updated approach for the Program Renewal planning period.

Background on SMP-1 and SMP-2 Mitigation Approaches

Under SMP-1, Valley Water established PMAs for certain in-channel maintenance activities to offset impacts to wetlands and waters of the U.S./state. Specifically, PMAs were established for sediment removal, removal of vegetation less than 6 inches dbh, and in-channel herbicide application activities conducted during SMP-1. Where PMAs were established, those specific activities were mitigated for in perpetuity. In addition, where sediment removal PMAs were

established during the SMP-1 period, future impacts to vegetation less than 6 inches dbh and wetlands on the sediment within the same sediment removal footprints were also permanently mitigated for. During the SMP-1 planning period (2002-2012), Valley Water mitigated work activities in perpetuity through a combination of land acquisition, habitat protection, and wetland restoration/creation activities. SMP-1 mitigation projects are summarized in the SMP Manual (Appendix A).

Under SMP-2 (20134-2023), Valley Water adjusted its approach to include more on-site and off-site mitigation activities based on annual work needs in addition to seeking additional PMAs. Under the SMP-2 approach, Valley Water provided and continues to provide compensatory mitigation for impacts to wetlands/other waters on an annual basis using the following three approaches:

1. **On-site and Off-site Ecologic Services-based Mitigation**: This included invasive plant management, native plant revegetation, removal of trash and pollutants from encampment activities, concrete removal, and rehabilitation of encampment-related excavated banks.

2. **Land-acquisition-Based Mitigation**: This included using remaining credit from completed SMP-1 mitigation projects and creation of new land acquisition-based projects.

3. **Species-specific Mitigation**: This approach included gravel augmentation and building instream complexity features.

Toward the latter half of the SMP-2 period (2019-2023), Valley Water moved toward a strategy of prioritizing multi-benefit mitigation sites. For example, along Calera Creek, Valley Water conducted sediment removal over a large area to make sure there was capacity in the reach to allow long term vegetation establishment, removed some existing large invasive trees, and installed a large revegetation site. Valley Water also implemented a mitigation project on Saratoga Creek which included a combination of rehabilitating a bank that had been altered by others through compaction and construction of dirt bike ramps, trash removal, and removal of concrete fragments in the channel.

During SMP-2, Valley Water primarily mitigated for impacts to salmonid habitat features through the construction of projects that installed LWD, gravel, and/or instream complexity features in the same watershed. Valley Water also constructed one fish passage improvement project on Stevens Creek at Evelyn Avenue. However, this project was not successful and therefore the mitigation was not applied to any SMP-2 impacts.

Program Renewal Mitigation Approach

For the Program Renewal, Valley Water proposes a strategy that includes a return to the overall focus toward establishing permanent mitigation for impacts to jurisdictional habitats or sensitive species via the establishment of new PMAs. Because the existing SMP-1 PMAs provide permanent mitigation, no additional mitigation is required along reaches where PMAs for maintenance activities have already been established.

To determine future mitigation needs, Valley Water will quantify Program impacts on biological resources, such as the acreage of impacts to wetlands and riparian habitats, sensitive communities, and special-status species' habitats, on an annual basis as work is performed from 2027–2036. Valley Water will tally the impacts of Program activities for a specific year at the end of each year. These impact calculations will then be used as the basis for determining mitigation to be provided at either that year's end or the following year. This annual analysis will clearly distinguish where activities occurred (e.g., in a PMA versus in new areas for which mitigation is required).

Valley Water will establish new PMAs for Program Renewal maintenance activities that result in permanent impacts to jurisdictional habitats or sensitive species for: (1) different maintenance activities occurring along reaches that have existing activity-specific PMAs, and (2) any maintenance activities occurring along reaches without any existing PMAs (including new channel areas incorporated into the program). The goal is that, over time, Valley Water will establish PMAs along channels that are likely to require ongoing vegetation removal below top of bank and/or sediment removal.

Under the Program Renewal, Valley Water would create new PMAs in areas outside existing PMAs. PMA mitigation opportunities would create, establish, and/or provide suitable mitigation to address permanent impacts associated with annual repeated maintenance activities. Opportunities to provide suitable and high-quality mitigation to address the potential impacts to the channel's functions and values could occur through restoring existing Valley Water habitats or restoring or improving other watershed lands, or non-Valley Water maintained creeks, or other natural resources. Mitigation would be provided in perpetuity as it was for PMAs established during SMP-1.

Although this approach is similar to the PMA approach in SMP-1, the Program Renewal would develop additional PMAs that would target a smaller subset of high priority channels that require repeated annual maintenance and do not currently have PMA status.

The Program Renewal mitigation approach also plans to use remaining and available mitigation credit from mitigation projects established during SMP-1 to mitigate for new permanent impacts (i.e., Island Ponds, Pajaro Freshwater Wetland, and Landings project). Additionally, the Program Renewal mitigation approach would rely on the VHP, which is currently being amended[4] (amendment expected to be considered for approval in 2026, and the associated VHP In Lieu Fee (ILF) Program. The ILF Program is used to compensate for unavoidable impacts on Waters of the U.S. and Waters of the State and federally-listed anadromous fish. Specifically, the Program Renewal would comply with VHP conditions, pay impact fees in accordance with the types and acreage of habitat, and implement VHP-specified conservation measures. Obtaining coverage under the VHP could be a component of the proposed mitigation package, provided that the VHP's ILF program would make enough credits available for Valley Water to purchase to be able to compensate for Program Renewal impacts to regulated habitats and VHP-covered species. Incidental take approval for

[4] The VHP amendment includes the addition of new covered species, updates to the conservation strategy, adding the Program Renewal as a covered activity, expanding the VHP area boundary, and more.

VHP-covered federally listed species will be provided via the VHP for VHP-covered activities and species. Where take of state- or federally-listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, endangered species consultations will continue to occur on an as-needed basis.

Before the VHP is amended, if residual impacts from maintenance activities remain significant under CEQA after implementation of Valley Water's BMPs, Valley Water will provide compensatory mitigation for impacts on biological resources, as discussed in Section 3.4.4, "Impact Analysis" under *Mitigation Approach*.

Except for using remaining mitigation from mitigation projects established during SMP-1, it may be several years before Valley Water is able to fully implement these mitigation options due to the large scale of some of the mitigation projects and the time involved for completing the plan design and the permitting process for the projects. Accordingly, similar to the SMP-2 approach, providing mitigation on an annual basis for Program Renewal maintenance activities will likely be necessary while these longer-term approaches are developed. Valley Water's proposed approach for providing mitigation on an annual basis would be met through the following:

(1) Encampment cleanup and bank rehabilitation,

(2) A grant program to fund projects by local watershed groups and homeless community services, and

(3) Trash removal and additional mitigation options.

These options are described in the subsections below, and incorporated into some of the EIR mitigation measures in Section 3.4, "Biological Resources." Additional compensatory mitigation for impacts to sensitive species are described in Section 3.4, "Biological Resources."

To address impacts on the riparian corridor, Valley Water may develop reach characterization sheets for areas where frequent maintenance activities are projected to occur in 10-year Program Renewal period. These characterization sheets would be utilized to describe biological resources, water quality conditions, and overall ecological function within a channel reach; ongoing and future maintenance needs; and whether potential restoration opportunities exist within a reach. The characterization sheets may also be used to identify and map large trees with high importance and ecological value and describe potential opportunities for enhancing these trees. Reach characterizations could include descriptions of methods for maintaining individual reaches in a manner that has a neutral or positive effect on the reach's habitat function, therefore avoiding a need for separate compensatory mitigation.

Encampment Clean-up and Bank Rehabilitation

In recent years, Valley Water has observed a dramatic increase in encampment generated trash, debris, hazardous pollutants, and encampment-caused wildfires on Valley Water-managed creeks, channels, and lands. Collectively, the removal of riparian vegetation (both

intentionally during creation and "maintenance" of encampments and unintentionally as a result of dumping of trash and trampling) and the abundance of trash are perhaps the most readily noticeable environmental issues in creeks throughout many of the urban and suburban areas of Santa Clara County. The growth of encampments and trash have led to increased and substantial water quality and habitat impacts to the region's streams and flood protection channels. Fires originating at encampments have also resulted in the loss of extensive riparian habitat.

Valley Water may conduct encampment cleanup activities to compensate for habitat impacts. Encampment cleanup includes removing human-caused inorganic trash that is in, or positioned to enter, aquatic and riparian habitats. This would provide mitigation for impacts associated with vegetation management, sediment removal, and bank stabilization activities. Chapter 10 the SMP Manual (Appendix A) discusses proposed mitigation ratios for each impact type. Valley Water may also repair and rehabilitate stream banks and floodplains impacted by encampment-related excavation as mitigation for temporary or permanent bank stabilization impacts.

Grant Program to Fund Projects by Local Watershed Groups and Support Homeless Community Services

Valley Water is also considering developing a local grant or partnership program to help fund and implement watershed improvement projects led by local nonprofit agencies and Resource Conservation Districts (RCDs) and to help fund unhoused community services. Such a program may annually fund mitigation projects that are directly tied to the specific activities resulting in water quality impacts under the Program Renewal. Example projects that this program may support include habitat restoration, erosion control, and water quality improvement projects in the Program Renewal Area. Chapter 10 the SMP Manual (Appendix A) discusses proposed mitigation ratios for each impact type.

In addition, because the abundance of trash is one of the primary water quality issues in northern Santa Clara County's creeks, much of which is associated with unauthorized encampments, the grant program may also provide financial support to unhoused community services. Such services may include housing, employment, vocational services, mental health and recovery programs, and other related support services. By supporting such services, Valley Water would indirectly improve creek water quality by helping the unhoused community find more permanent housing solutions and move the unauthorized encampments out of Valley Water's creeks. Water quality would be improved due to the removal of trash, debris, and hazardous pollutants. There would be less obstructions to fish passage, and there would be less damage to fish and wildlife habitats.

Trash Removal

Trash removal work that occurs outside of encampment clean-up activities may serve as mitigation for vegetation removal and sediment removal activities that would result in impacts to wetlands/other waters of the U.S./state. Removing trash helps improve water quality and aquatic habitat for plant and terrestrial species. Chapter 10 the SMP Manual (Appendix A) discusses proposed mitigation ratios for each impact type.

Additional Mitigation Options

In addition to the annual mitigation approaches described above, this section describes additional mitigation options that may be implemented on an annual basis for Program Renewal activities. These measures are incorporated into some of the EIR mitigation measures in Section 3.4, "Biological Resources." These options may be implemented in addition to PMAs and the payment of VHP fees (if/when the VHP amendment is adopted) for the duration of the 10-year Program Renewal period, to allow flexibility. See Chapter 10 of the SMP Manual (Appendix A) and the Mitigation Monitoring and Reporting Program (MMRP) for additional details.

- **Revegetation**. As in SMP-2, this involves conducting revegetation activities to compensate for the loss of quality and quantity of riparian habitat resulting from SMP impacts. A typical planting palette, plant list, and proposed mitigation ratios are described in the SMP Manual (Appendix A).
- **Concrete Removal**. The removal of concrete would expand wetlands and/or waters of the U.S./state and will enhance riverine functions. This would provide mitigation for bank stabilization activities resulting in permanent impacts on wetlands/waters of the U.S./state.
- **Fishery Restoration Projects**. Valley Water envisions constructing one or more large mitigation project(s) that involve restoration of salmonid habitat through passage improvement; installation of habitat features such as LWD, gravel, and instream complexity; or other methods to improve streams' function as salmonid habitat. This type of mitigation project would provide mitigation for downed tree management work involving removal of LWD in anadromous salmonid creeks and/or impacts to salmonid habitat features associated with bank stabilization and sediment removal projects in salmonid creeks. The Coyote 10B, Stevens Creek Evelyn Avenue Fish Passage, and Pickell's Dam Removal mitigation projects are examples of projects that restore salmonid habitat.
- **VHP Impact Fees and ILF Program.** Even if the Program Renewal would not be covered under the VHP during the initial years of the Program Renewal period, paying VHP fees would be appropriate to mitigate Program Renewal impacts to VHP-covered species because these fees would directly benefit covered species in the South Bay region. This mitigation approach is consistent with the Habitat Agency's Voluntary Fee Payments Policy. In the event that Valley Water needs to remove large invasive trees in VHP-covered areas and depending on the habitat value provided by such trees, Valley Water may also pay VHP impact fees for the acreage of land cover that is modified by invasive tree removal activities. For removal of noninvasive trees greater than 6 inches dbh, tree planting and/or payment of VHP impact fees would provide mitigation for tree removals. Purchase of ILF credits would provide mitigation for impacts to waters of the U.S./state and compensate for Program Renewal impacts to regulated habitats in addition to VHP-covered species. Where take of state- or federally-listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, endangered species consultations will continue to occur on an as-needed basis.

- ~~**Reach Characterizations.** To address impacts on the riparian corridor, Valley Water may develop reach characterization sheets for areas where frequent maintenance activities are projected to occur in 10-year Program Renewal period. These characterization sheets would be utilized to describe biological resources, water quality conditions, and overall ecological function within a channel reach; ongoing and future maintenance needs; and whether potential restoration opportunities exist within a reach. The characterization sheets may also be used to identify and map large trees with high importance and ecological value and describe potential opportunities for enhancing these trees. Reach characterizations could include descriptions of methods for maintaining individual reaches in a manner that has a neutral or positive effect on the reach's habitat function, therefore avoiding a need for separate compensatory mitigation.~~
- **Post-Wildfire Recovery.** In situations where a large and destructive riparian wildfire occurs, Valley Water may propose restoration of ecosystem function following a wildfire as a mitigation option. Valley Water would submit the wildfire recovery plan as part of the NPW process and include a description of the mitigation proposal. Activities may include but are not limited to revegetation and hydroseeding to reduce erosion, invasive plant species control, road repair, and removing critical safety hazards (dead or dying trees) to promote and support habitat for animal and plant species. The plan will also describe success criteria, monitoring processes, and site maintenance.

2.11 PERMITS, APPROVALS, AND CONSULTATION REQUIREMENTS

Several federal and state regulatory agencies granted permits, approvals, and permit extensions to Valley Water to implement SMP-2 (for the 2013~~4~~-2023 period), some of which expired in 2023 and 2024. Specifically, permits from the U.S. Army Corps of Engineers (USACE), Central Coast Regional Water Quality Control Board (CC RWQCB), and California Department of Fish and Wildlife (CDFW) expired on December 31, 2023. The biological opinion from National Marine Fisheries Services (NMFS) expired on April 8, 2024 and the biological opinion from U.S. Fish and Wildlife Service (USFWS) expired on April 15, 2024. The permit from the San Francisco Bay Conservation and Development Commission (BCDC) expires on April 30, 2026. The SF Bay RWQCB Section 401 Water Quality Certification did not include an expiration date and will be valid until the SF Bay RWQCB issues a new Order.

The same above-described agencies (with the exception of the SF RWQCB) were asked to issue new or amended multi-year permits and approvals to authorize Valley Water to continue implementing the SMP between 2027 and 2036.

- USFWS confirmed that the change in expiration date did not change the effects analysis of jeopardy determination of their Biological Opinion and communicated that USACE can still request SMP projects to be appended to their Biological Opinion as needed (Griego 2022).
- USACE reinitiated consultation with NMFS on May 3, 2023 and NMFS prepared a Biological Opinion for a 3-year extension that is valid until December 31, 2026. USACE issued an extension of Regional General Permit 17 to December 31, 2026. Purchase of ILF

credits would provide mitigation for impacts to waters of the U.S./state and compensate for Program Renewal impacts to regulated habitats in addition to VHP-covered species.

- Where take of federally-listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, endangered species consultations will continue to occur on an as-needed basis. Where take of state -listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, incidental take coverage would be provided via Incidental Take Permits from CDFW, on an as-needed basis.
- CDFW extended the Lake and Streambed Alteration Agreement to December 31, 2028. This LSAA was amended in September of 2024 to include explicit coverage of concrete removal mitigation items and salmonid habitat feature mitigation items in the Pajaro watershed, which had been described in the SMP-2 Manual, but not explicitly described in the LSAA.
- The CCRWQCB extended the Section 401 Water Quality Certification to December 31, 2026.
- BCDC granted an amendment that will expire on April 30, 2026, and Valley Water has applied for an extension through December 2026.

Table 2-9 summarizes applicable permits and approvals that were proposed for renewal, the extensions and amendments that were granted, and the permits and approvals that would authorize Program Renewal activities. In addition to the permits and approvals listed in Table 2-9. state and local agencies would issue encroachment permits as needed to implement Program Renewal maintenance activities.

As CEQA responsible agencies, the state permitting agencies will utilize this SEIR (once it is certified) as the CEQA compliance document in issuing new permits once the extensions and amendments expire. If applicable, the USACE will use this SEIR as background information for Section 404 permit NEPA compliance, and the USFWS and NMFS will use this SEIR as background information for Section 7 consultation with the USACE once the extensions expire.

Table 2-9. Regulatory Agency Approvals and Extensions

Agency	Applicable Law/ Regulations Guiding Jurisdiction	Permit/Approval Description	Original Date of Issuance	Date of Expiration	Permit Extensions	Anticipated Year of Issuance for Program Renewal
NOAA National Marine Fisheries Service	Endangered Species Act (ESA) Section 7	Biological Opinion No: SWR-2011-3722	April 8, 2014	April 8, 2024	December 31, 2026	2027
U.S. Fish and Wildlife Service	Fish and Wildlife Coordination Act – Endangered Species Act	Biological Opinion Permit Number 08ESMF00-20212-F-0398	April 4, 2014	December 31, 2023	USACE can append projects to BO as needed through USACE permit extension date (December 31, 2026)	2027
U.S. Army Corps of Engineers (USACE)	CWA Section 404 – Section 10 of Rivers and Harbors Act of 1899	Regional General Permit No. 17 (USACE File No. SPN-1996-225250S)	April 22, 2021	December 31, 2023	December 31, 2026	2027
California Department of Fish and Wildlife (CDFW)	Fish and Game Code Section 1602	Lake and Streambed Alteration Agreement, Notification No. 1600-2011-0336-RD	September 25, 2014	December 31, 2023	December 31, 2028	2029
	Fish and Game Code Section 2081 (California Endangered Species Act)	N/A	N/A	N/A	N/A	TBD[5]

[5] Where take of state-listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, incidental take coverage would be provided via Incidental Take Permits sought by Valley Water from CDFW, on an as-needed basis.

Agency	Applicable Law/ Regulations Guiding Jurisdiction	Permit/Approval Description	Original Date of Issuance	Date of Expiration	Permit Extensions	Anticipated Year of Issuance for Program Renewal
Central Coast Regional Water Quality Control Board	Porter-Cologne Water Quality Control Act – Clean Water Act (CWA) Section 401, Water Quality Certification	Certification No. 34319WQ06	May 19, 2020	December 31, 2023	December 31, 2026	2027

Table 2-10. SMP Best Management Practices

BMP Number	BMP Title	BMP Description
		General Avoidance and Minimization Measures
GEN-1	In-Channel Work Windows	**Ground-Disturbing Activities** All ground-disturbing maintenance activities will take place between June 15 and October 15 unless an extension is granted. These activities are summarized in Table 3-1 of the SMP Manual. No new instream sediment removal projects or bank protection work will be initiated after October 15. Requests for work window extensions must be submitted to the regulatory agencies by October 1, listing the creek names and reaches where a work extension will occur. Work extensions vary per work activity. The agencies will provide a single response within one week. Beyond October 15, with regulatory agency approval, work may continue if no significant rainfall (defined for the sake of all BMPs as 0.5 inch or greater within a 24-hour period within the subject watershed) is either forecasted[6] or observed. Following October 15, work shall cease for the season if significant rainfall is forecasted or observed. For vegetation removal that involves ground disturbance, work may continue until December 31 or until significant rainfall. Starting September 1, 72-hour weather forecasts will be monitored daily, and sites must be maintained so that they can be rapidly winterized[7] (implement control measures BMP GEN-25). <u>Work Extensions for Vegetation Removal, Post-Project Restoration, Tree Removal, and Certain Minor Maintenance Activities Involving Ground Disturbance</u> 1. <u>Salmonid Streams</u>: Work may continue until December 31, or until significant rainfall is forecasted or occurs. 2. <u>Other Streams</u>: a. No work shall occur within 24 hours prior to and following significant rainfall (forecasted or observed).

[6] Weather Forecasts. No phase of the project may be started if that phase and its associated erosion control measures cannot be completed prior to the onset of a storm event if that construction phase may cause the introduction of sediments into the stream. Seventy-two-hour weather forecasts from the National Weather Service or other localized and more detailed weather forecast service will be consulted prior to start-up of any phase of the project that may result in sediment runoff to a stream.

[7] Winterization is the process of maintaining work sites and preparing work sites for rainfall with the appropriate BMPs to prevent erosion and sediment transport and protect water quality. Winterization occurs upon completion of work activities or, on incomplete projects, prior to the occurrence of forecasted rainfall with at least 25% chance of 0.10 inch in 24 hours.

BMP Number	BMP Title	BMP Description
		b. Work in streams may continue until December 31, or until significant rainfall (forecasted or observed). There are no restrictions on work within dry streams. New ground-disturbing minor maintenance activities that consist of grading, rocking, recompacting, and resurfacing maintenance roads or installing and maintaining trash booms that are initiated after October 15 must be completed in five days or less. Work Extensions for Sediment Removal (including minor maintenance sediment removal) Limits on the duration of extended in-channel work windows for sediment removal activities are as follows: 1. Salmonid Streams: For creeks supporting anadromous fish, the work window may be extended through October 31 (or until significant rainfall is forecasted or observed) if the sediment removal project will be at least 50% complete by October 15. 2. Other Streams: For creeks not supporting anadromous fish (with the exception of reaches listed under #3 below), the work window may be extended through November 30, or until significant rainfall is forecasted or occurs, whichever occurs first. 3. Extended Work Window Reaches: For Berryessa Creek (0-88+80; 232+70-236+00; 284+30-288+00), Lower Silver Creek (Reach 3 between Stations 37+40 and 381+19), Thompson Creek (0+00-10+00), Canoas Creek (0+00-390+00), Ross Creek (0+00-86+30), Calabazas Creek (35+00-105+00), and San Tomas Aquino Creek (80+00-100+00), which are hereby defined as Extended Work Window Reaches, the work window may be extended through December 31 with the following conditions: o Site conditions are dry, and access for all construction equipment and vehicles will not impact waterways. o All work will stop if any rainfall is forecast for the next 72-hour period. o Work may occur after a significant rainfall event, but no later than December 31. Work Extensions for Bank Stabilization and Management of Animal Conflicts (with ground disturbance) Bank stabilization and management of animal conflicts with ground disturbance projects may continue until the approved dates specified below. Prior to a forecasted significant rainfall event, all incomplete bank stabilization projects must be winterized. 1. Salmonid Streams: In creeks supporting anadromous fish, the work window may be extended until October 31 (or until significant rainfall is forecasted or observed) if the bank stabilization/animal conflict project will be at least 50% complete by October 15. 2. Other Streams: In creeks not supporting anadromous fish: o The work window may be extended until November 30 (or until significant rainfall is forecasted or observed) if the bank stabilization/animal conflict project will be at least 50% complete by October 15. Certain new projects that will be completed in 5 days or less may

BMP Number	BMP Title	BMP Description
		not be 50% complete by October 15. ~~and for new bank stabilization projects that will be completed in five (5) days or less.~~ **Activities That Do Not Result in Ground Disturbance** Work in this category may include vegetation removal and pruning, mowing, management of animal conflicts, and minor maintenance activities that do not result in ground disturbance. These activities are summarized in Table 3-1 of the SMP Manual (Appendix A). Instream activities within the wetted portion of the channel may occur year-round in all streams (including salmonid streams), except when wheeled or tracked equipment needs to access the site by crossing a creek, ponded area, or secondary channel. No work shall occur within 24 hours prior to or following significant rainfall. Work within streams that support anadromous fish outside of the June 15 through October 15 work window must adhere to the following conditions: • Applicable pre-activity surveys and biological monitoring must be performed (BMP GEN-6 through GEN-19, as applicable). • Modification and removal of instream large woody debris will occur as described in the NMFS Biological Opinion. • When work occurs in the wetted channel, within seven days before the start of work, a qualified biologist will survey for sensitive fish species, especially steelhead and redds, within the work area. • A qualified biologist must be on-site to monitor work that occurs in the wetted channel. The biologist will notify crews of the locations of any redds and ensure that direct impacts on redds and sensitive fish species (especially steelhead) are avoided during work activities. As needed, the monitor will advise work crews regarding how to minimize impacts on sensitive fish species and their habitat (e.g., minimizing the footprint of the work area and access routes).

GEN-2	Instream Herbicide Application	<u>All Streams</u> Instream (below ordinary high water) herbicide applications will take place between June 15 and October 15. The work window may be extended until either December 31 or until significant rainfall is forecasted or observed. In addition, herbicide application requirements are as follows: • Herbicides shall not be applied directly to water. • Valley Water shall not apply herbicide when wind speeds exceed 10 miles per hour. Valley Water will use herbicides with the following active ingredients as part of the Program Renewal: aminopyralid, aminopyrali + triclopyr, aminopyralid + florpyrauxifen-benzyl, clopyralid, dithiopyr, ethyl oleate, glyphosate, imazamox, imazapyr, isoxaben, paraffinic oil, triclopyr, and triclopyr-choline. As described in Chapter 4.3.7 of the SMP Manual, Valley Water may in some cases substitute other materials as they become available. Any new materials incorporated into Program Renewal herbicide application will be subject to any relevant injunctions. <u>2014 Salmonid Injunction</u> None of these ingredients are subject to the August 15, 2014, injunction for salmonids, which includes restrictions related to protecting streams mapped as critical habitat for Central and South-Central California Coast steelhead. Thus, the restrictions described in this injunction do not apply to Valley Water herbicide use under the Program Renewal. <u>2010 Bay Area Listed Species Injunction</u> Valley Water will not be using chemicals subject to this injunction. <u>2006 California Red-Legged Frog Injunction</u> Seven of these active ingredients are subject to the October 20, 2006, injunction that applies to the California red-legged frog: aminopyralid + triclopyr, glyphosate, imazapyr, triclopyr, and triclopyr-choline. The following restrictions apply to the use of herbicides with these active ingredients within (1) designated critical habitat for the California red-legged frog and (2) additional California red-legged frog habitat areas shown on Figure A-1 of the SMP Manual. • Herbicides with these active ingredients may not be used within 60 feet (for ground use) or 200 feet (for aerial use) from the edge of aquatic breeding, aquatic nonbreeding, or upland habitat. • Exceptions to these restrictions are as follows: o For the state-designated invasive species[8,9] and noxious weeds, with the following conditions: ▪ The herbicide is not applied within 15 feet of aquatic breeding or non-breeding habitat. ▪ Application is limited to localized spot treatment using hand-held devices. ▪ Precipitation is not occurring or forecast to occur within 24 hours. ▪ The herbicide is applied by a certified applicator or an individual working under the direct supervision of a certified applicator.

BMP Number	BMP Title	BMP Description
		○ For herbicides applied for the following uses: ▪ Tree injection applications ▪ Localized spot treatments using handheld devices on rights-of-way, roadsides, pastures, lawns, or in forests are permitted, provided that such use occurs at least 60 feet from the edge of aquatic breeding or nonbreeding habitat. ▪ Individual tree removal using cut stump application is permitted, provided that such use occurs at least 60 feet from the edge of aquatic breeding or nonbreeding habitat. ▪ Basal bark application to individual plants, provided that such use occurs at least 60 feet from the edge of aquatic breeding or nonbreeding habitat.

[8] A list of state-designated invasive species can be found at https://cal-invasives.net/home/species.html.

[9] A list of state-designated noxious weeds can be found at https://www.cdfa.ca.gov/plant/IPC/encycloweedia/winfo_weedratings.html.

BMP Number	BMP Title	BMP Description
GEN-3	Avoid Exposing Soils with High Mercury Levels	Sediment removal and bank stabilization projects in portions of the Guadalupe River watershed affected by historic mercury mining may expose soils containing mercury. 1. In Basin Plan-identified creeks in the Guadalupe River Basin, soils that are likely to be disturbed or excavated shall be tested for mercury (Hg). Soils shall be remediated if disturbed or excavated soils exposed to streamflow have a residual sample test exceeding 0.2 mg mercury per kg of erodible sediment (dry wt., median). 2. Remediation may be accomplished either by: a. treating the site so that contaminated soils excavated for the purpose of bank stabilization shall not be susceptible to erosion; or b. further excavating contaminated soils and replacing them with clean fill or other bank stabilization materials that are free from contaminants. c. Soils with residual sample mercury concentrations exceeding 0.2 mg mercury per kg of erodible sediment (dry wt., median) shall be removed and disposed of in a Class I landfill following established work practices and hazard control measures. Soils with residual sample mercury concentrations less than 0.2 mg mercury per kg of erodible sediment (dry wt., median) will remain at the project site. 3. To ensure worker safety during sediment removal and bank stabilization projects with elevated mercury concentrations on the exposed surfaces, personal protective equipment will be required during project construction to maintain exposure below levels established by the Occupational Safety and Health Agency (OSHA).
Biological Resource Measures		
GEN-4	Minimize the Area of Disturbance	To minimize impacts to natural resources, soil disturbance will be kept to the minimum footprint necessary to complete the maintenance operation.
GEN-5	Mitten Crab Control Measure	Sediment from the San Francisco Bay Watershed, including that for reuse, cannot be moved to areas any farther south than Coyote Creek Golf Drive in south San Jose, and the intersection of McKean and Casa Loma Roads.
GEN-6	Protection of Nesting Birds	Nesting Bird Survey Methodology Biological Review of Project: Maps and photographs of the project location will be reviewed by a qualified biologist before a survey is conducted. The survey area will be determined using maps of the projected access, staging, and work areas. A qualified biologist will review the survey area and project details to determine if nesting bird survey can be

BMP Number	BMP Title	BMP Description
		conducted by a designated individual (DI) in place of a qualified biologist. A qualified biologist may determine a DI can conduct the nesting bird survey prior to pre- and post-emergent herbicide application along maintenance roads or for mowing activities in ruderal areas with minimal nesting substrate (<10% canopy cover) when a nest can be easily detected. If a qualified biologist determines it is appropriate for DIs to conduct the nesting bird survey, the qualified biologist will provide written direction to the vegetation management team allowing for DI survey. DIs will follow the survey protocol outlined in Section 2. For all other projects, a qualified biologist will conduct a nesting bird survey following the protocol outlined below. Survey Location: A qualified biologist shall perform a nesting bird survey throughout the entirety of the work area (including access and staging areas), as well as a 100-foot buffer beyond the designated perimeter of the project area when possible (depending on access and property lines/limits). Suitable nesting habitat within the survey area will be identified to help determine what species may be present and what type of nests could be expected. Survey Timing: Seasonal timing: Nesting bird season begins January 15 and ends September 1. Some of the local bird species in Santa Clara County are known to nest outside of the established nesting season (ex: Anna's hummingbirds begin nesting in late December some years); precautionary nesting bird surveys may be conducted year-round by Valley Water qualified biologists to account for birds that nest out of season. Session timing: A qualified biologist will conduct a nesting bird survey during daylight hours, beginning at dawn. Surveys will not be conducted in instances of excessive or abnormal cold, heat, wind, rain, or other inclement weather that may interfere with nest detection or reduce bird activity. The biologist will spend a minimum of 5-10 minutes of quiet observation at the beginning of each survey to assess bird activity level before slowly walking through the survey area in search of nests and nesting behavior. The amount of time spent for each survey will vary based on size of survey area, habitat and density of vegetation present, type of work to be conducted, time of year, etc. Survey techniques: A qualified biologist will quietly observe the project area at the beginning of each survey to assess bird activity level. The qualified biologist will then walk slowly through the survey area, using passive visual and auditory observation to detect all bird nests in and around the survey area. If nests cannot be identified, but a nest is

BMP Number	BMP Title	BMP Description
		suspected due to observed bird behavior or aural cues, the qualified biologist will flag the area and create an ample buffer for any suspected or potential nests. Circumstances such as terrain, vegetation, season, likely species present, built environment, presence of human activity, and activity for which the survey is occurring can be factors in determining the most effective strategy of surveying for nesting birds. Qualified biologists shall use professional judgement based on expertise, experience, and site knowledge to determine appropriate walking patterns and other details of survey strategy. The area that the qualified biologist surveys in any survey will be limited to an area where work is estimated to be completed within seven days. In some cases, one qualified biologist will conduct the survey. In other cases, multiple biologists will conduct the survey, where it is either determined that multiple biologists would be more effective or when working alone is unsafe due to situations such as encampments or criminal activity. Number of surveys: One nesting bird survey will be conducted within 7 days prior to the start of work. A second or follow-up survey may be conducted on a separate day in the case of high bird activity, decreased bird activity/detection due to unfavorable survey conditions (such as a change in weather, noise disturbance, or time of day), and/or in any case whereby the qualified biologist cannot confidently identify all bird nests in the project area. Qualified biologist will provide justification for number of bird surveys performed for each work order and documentation of justification will be provided to CDFW. If a lapse in project-related work of 7 days or longer occurs, another survey will be conducted before project work can be reinitiated. Delaying work: Activities that post an elevated risk of impacting nesting birds will be conducted outside of the local peak of nesting bird season (as determined by a qualified biologist). Qualified biologist will delay vegetation removal work if 3 or more nests are detected in the work area, if the biologist cannot confidently survey the entire work area due to dense vegetation, and/or if there is high nesting bird activity and all suspected nests cannot be confidently identified and buffered within the project area. In the case of work being delayed for 3 or more nests having been detected in the work area, a qualified biologist may recheck nests at a later date. When the qualified biologist confirms that all nests in the work area that were detected during the initial survey are no longer active (the nest has failed or the chicks are

BMP Number	BMP Title	BMP Description
		fledged), the entire work area may be resurveyed by a qualified biologist. If the qualified biologist detects two or less nests during the resurvey, the nests will be buffered, and work will proceed outside of the buffered areas. Flagging and Buffering Nests: If an active nest (i.e., a nest with eggs or young) is found or suspected, a buffer will be established and maintained until the young have fledged. Standard buffer widths are 0.5 mile for bald and golden eagles; 250 feet for other raptors, least Bell's vireo, herons, and egrets; 50 feet for ground-nesting non-raptors; 700 feet for California Ridgway's rail or California black rail; 600 feet for California least tern and western snowy plover; and 50 feet for non-raptors nesting in trees, in shrubs, and on structures. A qualified biologist may identify an alternative buffer (larger or smaller) for individual nests on a case-by-case basis based on site-specific consideration of the species, the nature of the work, the height of the nest, intervening vegetation or topography buffering the nest from the work, pre-existing human activity to which the birds are already habituated, and other factors. The boundary of each buffer zone will be marked with flagging. The buffer zone will be maintained until the nest is no longer active, as determined by a qualified biologist. Data Management: Qualified biologists will document all observed and suspected nests in a shared geospatial database. Qualified biologists will record location of nest, date of survey, work order number, surveyor name, nesting bird species, photos, and any relevant notes. Nest map and nest details are immediately available to all biologists and field crews. Designated Individual (DI) Training and Survey Protocol DI Training Program Valley Water maintenance workers and contractors will complete a yearly mandatory classroom training on survey methodology, nest identification, and nest buffer protocol before nesting bird season begins. The classroom training will include survey demonstrations by Valley Water biologists, an overview of common nests found in Santa Clara County, nesting bird behavior, and a detailed overview on how to flag and buffer nests. Valley Water staff will also be required to complete a practical biannual (every other year) field training on DI survey protocols, nest identification, and binocular use. All field trainings will be led by Valley Water wildlife biologists during the nesting season (January 15 to September 1) and will emphasize quality over speed of surveys. DIs will be provided with a DI Handbook that outlines DI survey protocol and pictures and

BMP Number	BMP Title	BMP Description
		descriptions of common nests found in Santa Clara County. Supplemental field training will be provided throughout the nesting bird season by Valley Water wildlife biologists. Throughout the season, qualified biologists will meet DIs in the field to observe DI surveys and provide suggestions and adjustments as needed. DI Survey Protocol Pre- and Post-Emergent Herbicide Activities: DIs will conduct a passive observational and auditory survey of the daily work area during daylight hours, beginning at dawn, in appropriate meteorological conditions, to identify any birds exhibiting potential nesting behavior. The observation of the work area and surroundings will take place over enough time to detect nesting birds. The survey time will vary based on the size and characteristics of each site but a minimum of one hour per one acre of potential nesting substrate will be spent on the survey. If nesting behavior is observed, DIs will identify, flag, and buffer the nest area. If nests cannot be identified, but a nest is suspected due to observed bird behavior or aural cues, the DI will flag the area and create an ample buffer for any suspected or potential nests. Mowing Activities: The enhanced DI survey protocol for mowing activities will involve two surveys led by trained DIs and will require DIs to walk ahead of mowing crews. These methods are outlined in greater detail below. The first survey will be a passive observational and auditory survey of the daily work area to identify any birds exhibiting potential nesting behavior. The observation of the work area and surroundings will take place over enough time to detect nesting birds. The survey time will vary based on the size and characteristics of each site but a minimum of one hour per one acre of potential nesting substrate will be spent on the survey. If nesting behavior is observed, DIs will identify, flag, and buffer the nest area. If nests cannot be identified, but a nest is suspected due to observed bird behavior or aural ques, the DI will flag the area and create an ample buffer for any suspected or potential nests. After the passive observational and auditory survey, a stick or rope drag survey will be conducted prior to mowing work in the daily work area. The DIs will walk through the project area using stick or rope drag methods to disturb the grass while avoiding contact with the ground. Rope drag surveys will be conducted using a lightweight rope held by two individuals walking at the same pace through the survey area. Another trained DI equipped with binoculars will stand 70 feet behind the stick or rope and monitor for any potential activity that reveals nesting birds. If a bird is flushed, the DI will stop the survey, wait for bird to return to nest, and flag and buffer nest area. If the DI does not observe the bird return to the nest, no work will occur in the area.

BMP Number	BMP Title	BMP Description
		Finally, DIs will walk ahead of active mowing crews to watch for flushing birds. If a bird is flushed, the DI will stop work and wait for the bird to return to the nest, and flag and buffer nest area. If the DI does not observe the bird returning to the nest, no work will occur in the area. Flagging and Buffering Nests: Standard buffer widths are 0.5 mile for bald and golden eagles; 250 feet for other raptors, least Bell's vireo, herons, and egrets; 50 feet for ground-nesting non-raptors; 700 feet for California Ridgway's rail or California black rail; 600 feet for California least tern and western snowy plover; and 50 feet for non-raptors nesting in trees, in shrubs, and on structures. The boundary of each buffer zone will be marked with flagging. The buffer zone will be maintained until the nest is no longer active, as determined by a qualified biologist. Data Management: Senior Maintenance Workers will document the time spent conducting DI surveys in the daily Maximo log. DIs will document area surveyed, time spent conducting survey, and all observed and suspected nests in the DI Field Survey Data Sheet (**Error! Reference source not found.**). All nests recorded in the DI Field Survey Data Sheet are automatically included in the biological resources map and nest information is immediately available to biologists and field crews. Qualified biologists will review DI survey logs and identified nests throughout nesting bird season. Nest Disturbance: In any case of a nest disturbance or take of nesting birds, a CDFW representative will be notified within 24 hours. In cases where a nest has been disturbed but left in place, a qualified biologist will check on the nest later that day and/or the following day to determine the state of the nest. After the nesting bird incident, Valley Water will investigate the nesting bird incident and prepare a full report of the incident. This full report will be submitted to CDFW within 90 days, though Valley Water will strive to submit the report within 30 days.
GEN-6.1	Protection of Alameda Song Sparrow and San Francisco Common Yellowthroat	Pre-activity surveys for the Alameda song sparrow and San Francisco common yellowthroat will occur using the general procedures described in BMP GEN-6. Individual song sparrows will be determined to potentially be Alameda song sparrows if they occur within the range indicated in Figure A-2 (included in Attachment A of the SMP Manual). This subspecies typically occurs in tidal salt marsh and brackish marsh, though it also occurs in nontidal salt marsh having sufficiently dense/tall vegetation; it could potentially occur in reaches of mixed brackish/fresh marsh; and it also occurs in dense vegetation at upland/wetland edges adjacent to any of the wetland types described above. Individual common yellowthroats will be determined to potentially be San

BMP Number	BMP Title	BMP Description
		Francisco common yellowthroats if they occur within the range indicated in Figure A-2 of the SMP Manual, regardless of the habitat type in which they are found. If a pre-activity survey occurs within the range of the San Francisco common yellowthroat and/or Alameda song sparrow (see Figure A-2 of the SMP Manual) during their nesting season (defined as February 25–August 15), one of the following survey methods will be used to ensure the protection of active nests of these species: 1. If the biologist identifies more singing male song sparrows and/or common yellowthroats than active nests, inconspicuous nests of these species may have been missed. In this case, maintenance activities in the area will be delayed until after the nesting season. 2. If individuals of these species are found during pre-activity surveys and Valley Water wishes to perform breeding-season work near occupied habitat, the biologist will map the territories of common yellowthroats and song sparrows during the pre-activity survey by observing the movements and behaviors of individuals. Nesting within this mapped area will be assumed, and territories will be buffered by 50 feet.
GEN-6.2	Protection of Nesting Least Bell's Vireos	**Areas with Greatest Potential for Nesting Least Bell's Vireos** To the extent feasible, SMP activities occurring in areas with the greatest potential to support nesting least Bell's vireos (Pacheco Creek, the Pajaro River, and reaches of Uvas/Carnadero Creek and Llagas Creek downstream from Highway 152) shall be scheduled to occur outside of the least Bell's vireo nesting season (March 15 through July 31). If it is not feasible for maintenance activities along these reaches to be scheduled during the non-nesting season, the measures listed under *Pre-Activity Surveys* below will be implemented. <u>Pre-Activity Surveys</u> For maintenance activities that will result in minimal noise, do not require heavy equipment (with the exception of a mower operated outside the riparian corridor), are limited in duration (60 minutes or less), and require no more than 3 personnel, pre-activity surveys will be performed within the work area and a surrounding buffer of 100 feet. For all other maintenance activities, pre-activity surveys will be performed within the work area and a surrounding buffer of 250 feet. Pre-activity surveys will be performed as follows: 1. Work will be preceded by a focused survey for at least Bell's vireos within two calendar days before the initiation of maintenance activities. The survey will be conducted between dawn and 11:00 a.m., during mild weather conditions (i.e., not during excessive cold, heat, wind, or rain), and within all riparian habitat in and within 100 or 250 feet of any proposed maintenance location along these reaches, as applicable. The survey will be conducted by a qualified biologist who is familiar with the visual and auditory identification of this species. The biologist should not survey more than 3 linear kilometers or 50 hectares

BMP Number	BMP Title	BMP Description
		of habitat on any given survey day. The numbers and locations of brown-headed cowbirds detected within vireo territories will be recorded. 2. To avoid last-minute changes in the work schedule if an active nest is found, a preliminary survey may be performed more than 2 calendar days prior to the start of maintenance activities. 3. To minimize impacts on nesting least Bell's vireos and other birds, the biologist will not initially be looking for Bell's vireo nests during these surveys. Rather, the biologist will look for and listen to individual vireos. If a least Bell's vireo is detected, it will be observed to determine whether it is actively nesting. The biologist will note the nest location, or if finding the actual nest could result in excessive disturbance or risk damaging the nest, the biologist will determine the approximate location based on observation of birds carrying nesting material, carrying food, or repeatedly visiting a certain area. 4. If one or more least Bell's vireo nests are detected, the measures listed under *Protection of Active Nests* below will be implemented. <u>Protection of Active Nests</u> 1. If an active nest is found, a minimum 250-foot no-activity buffer will be established around the nest; for low-impact activities described above, a 100-foot buffer is appropriate if a qualified biologist monitors the birds during the activity and determines that the birds are not disturbed by the activity (if disturbance is observed, the buffer will be increased until the birds show no signs of disturbance). If a territorial male is found but no nest can be detected, then the approximate centroid of the bird's area of activity will be the point from which the buffer will be applied. The required buffer may be reduced in areas where dense riparian forest occurs between the construction activities and the active nest or where sufficient barriers or topographic relief exist to protect the nest from excessive noise or other disturbance. The biologist will coordinate with the USFWS and CDFW to evaluate exceptions to the minimum no-activity buffer distances for these activities on a case-by-case basis. 2. No work will occur within the buffer without verification by a biologist that the nest is inactive and until any fledged young are no longer dependent on adults for food. 3. If a least Bell's vireo and/or its nest are detected during pre-activity surveys, Valley Water will contact the USFWS and CDFW within two working days regarding the presence and location of the bird/nest. **Other Areas with Riparian Habitat within the Pajaro River Watershed** In other areas that provide potential least Bell's vireo habitat within the Pajaro River watershed, outside of the areas described above as having the greatest potential to support this species, pre-activity surveys will be conducted concurrently with surveys for other nesting birds following the procedures described in GEN-6.
GEN-7	Protection of Burrowing Owls	Pre-Activity Surveys During the nesting season (defined as February 1 to August 31), pre-activity surveys for burrowing owls will be performed as part of the nesting bird survey described in BMP GEN-6.

BMP Number	BMP Title	BMP Description
		During the nonbreeding season, a qualified biologist will conduct a desk audit to determine if high-quality habitat for burrowing owls (i.e., burrows of California ground squirrels and adjacent open grassland areas) is present within the work area. If (1) suitable habitat is present within the work area and (2) maintenance activities would potentially cause suitable burrows for this species to be crushed or blocked, a pre-activity survey will be performed within 7 days of the start of work activities. Regardless of the time of year, if a burrow with signs of burrowing owl presence (e.g., whitewash, pellets, and/or feathers) is observed during the pre-activity survey but no burrowing owl is present, a second survey will be performed within 24 hours prior to the start of work to determine whether burrowing owls are present. The survey shall occur between morning civil twilight and 10:00 a.m., or between two hours before sunset and evening civil twilight, to provide the highest detection probability. If no burrowing owls are found during the pre-activity surveys, the work may proceed. If burrowing owls are detected during the surveys and/or during the course of maintenance activities, the measures listed under *Protection of Individuals* below will be implemented. Protection of Individuals 1. If occupied burrows are identified, a 250-foot radius no-work buffer zone will be established around the burrow. No maintenance activities will occur within the 250-foot buffer zone during the nesting season (defined as February 1 to August 31). However, the buffer may be reduced with CDFW approval to take into consideration paved roads, intervening riparian corridors, levees, the nature of the work, and other factors that might indicate a reduced buffer would be adequate. 3. After the nesting season, work may occur within the 250-foot buffer zone provided: a. A qualified biologist monitors the owls for at least 3 days prior to construction to determine baseline foraging behavior (i.e., behavior without construction). b. The same qualified biologist monitors the owls during construction and finds no change in owl foraging behavior in response to construction activities. c. If there is any change in owl foraging behavior as a result of construction activities, these activities will cease within the 250-foot buffer. d. If the owls are gone for at least one week, the project proponent may request approval from the Santa Clara County Habitat Agency that a qualified biologist excavate the usable burrows to prevent owls from re-occupying the site. After the usable burrows are excavated, the buffer zone will be removed, and construction may continue. If work is not covered by the VHP, Valley Water will consult with CDFW prior to any excavation of burrows. e. Monitoring must continue as described above for the non-breeding season as long as the burrow remains active.

BMP Number	BMP Title	BMP Description
		5. Exceptions: a. Routine Use of Levee Roads: Routine use of existing Valley Water maintenance roads within the 250-foot buffer will be allowed year-round. However, no traffic involving loud/heavy equipment associated with sediment removal or bank stabilization will be allowed to use the maintenance road in a burrowing owl buffer during the active nesting period. b. Mowing: Mowing on levees may occur within 250 feet of active burrows year-round with the following conditions: i. A qualified biologist will monitor mowing within the buffer zone. ii. Active burrows will be marked by a qualified biologist. Markers shall be placed immediately prior to mowing and removed immediately following mowing, to avoid alerting predators to burrow locations. iii. No vehicle-mounted mowers will be used within 10 feet of occupied burrows. Areas within 10 feet of occupied burrows may be mown quickly using hand equipment (e.g., string trimmers) when no owls are visible on the surface. iv. All mowing activities within the buffer zone will be completed within 30 minutes.
GEN-8	Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities	A qualified botanist will identify special-status plant species and sensitive natural vegetation communities and clearly map or delineate them as needed in order to avoid and/or minimize disturbance, using CDFW protocols and the *CNPS Botanical Survey Guidelines* to formulate the following protocols: 1. A qualified botanist will use Valley Water's GIS database, the CNDDB, Santa Clara Valley Habitat Plan (VHP) data, and/or other suitable tools to identify potential locations of special-status plants and sensitive natural vegetation communities within or near work areas. 2. All activities within serpentine areas will be avoided, including herbicide application. 3. Within non-serpentine areas, protocol-level surveys within areas identified as sensitive natural communities or suitable habitat for special-status plant species will be conducted by a qualified botanist within 1 year prior to commencement of work. If these surveys detect an occurrence of special-status plants, this occurrence will be submitted to CNDDB. 4. Surveys will be conducted during the appropriate time of the year (i.e., the target species' blooming period) to adequately identify special-status plants that could occur on or immediately adjacent to the site of proposed maintenance activities. 5. For all maintenance activities, impacts to sensitive natural communities and special-status plants identified by the qualified botanist will be avoided and/or minimized. The qualified botanist will recommend one or more of the following measures, as appropriate, to avoid and/or minimize impacts: a. Flag or otherwise delineate in the field the special-status plant populations and/or sensitive natural community to be protected.

BMP Number	BMP Title	BMP Description
		b. Maintain an adequate no-disturbance buffer around plants or habitat. The location of the buffer will be shown on the maintenance design drawings and marked in the field with stakes and/or flagging in such a way that the buffer is visible to maintenance personnel without excessive disturbance of the sensitive habitat or population itself (e.g., from installation of fencing). c. Time construction or other activities to occur during periods of the year when the plant species is dormant and/or in a non-critical life cycle period. This is more appropriate for annual plants rather than perennials. d. Store removed sediment off site. e. Limit the operation of maintenance equipment to established roads whenever possible. 6. If any individual special-status plants are impacted, regardless of the extent of the impact, Valley Water will collect and bank seed with an accredited institution to facilitate potential future restoration opportunities and conserve the population's genetic diversity. 7. For vegetation management activities: a. No herbicides, terrestrial or aquatic, will be used in areas identified as potential habitat for special-status plants species or containing sensitive natural communities, until a qualified botanist has surveyed the area and determined the locations of special-status plant species. b. If special-status plant species or sensitive communities are present, the qualified botanist will determine if a given type of vegetation management method is ecologically appropriate for a given area. Alternative strategies based on the botanist's recommendations will be coordinated with appropriate staff.
GEN-9	Protection of Monarch Butterflies	1. A qualified botanist or Designated Individual will use Valley Water's GIS database and/or other suitable tools to identify milkweed within or near work areas. The database of milkweed locations will be updated on an ongoing basis based on the observed distribution of milkweed in Program work areas. 2. If milkweed is present, a qualified botanist will determine if a given type of vegetation management method is ecologically appropriate for a given area. Alternative strategies based on the botanist's recommendations will be coordinated with appropriate staff. 3. To the extent feasible, maintenance activities along stream reaches supporting known concentrations of milkweeds will occur between September 1 and March 15, when monarch eggs and larvae are absent. 4. If work occurs within areas supporting milkweed concentrations between March 15 and October 31, a qualified biologist or Designated Individual will conduct a pre-activity survey for milkweed prior to the start of work activities. a. The maintenance activity will maintain an adequate no-disturbance buffer around milkweed plants. The location of the buffer will be marked in the field with stakes and/or flagging in such a way that the buffer is visible to maintenance personnel without excessive disturbance of the sensitive habitat or population itself (e.g., from installation of fencing).

BMP Number	BMP Title	BMP Description
		c. No herbicides, terrestrial or aquatic, will be used in areas where milkweed concentrations are present. Anticipating the potential need for milkweed seed for mitigation projects in the future, Valley Water staff would also collect milkweed seed in association with their SMP mowing. Seed collection would be done with as minimal disturbance to the plant as practicable.
GEN-10	Protection of Crotch's Bumble Bees	VHP-covered activities will comply with applicable VHP conditions to protect Crotch's bumble bee. For non-VHP-covered activities, Valley Water will follow the procedures in the Final SMP Crotch's Bumble Bee Avoidance Plan (Valley Water 2024) to avoid and minimize impacts on the species. The measures in the Plan are as follows, described in greater detail in the Plan: • Annually train field staff and designated individuals (DIs) prior to the construction season how to identify insects such as bumble bees, how to recognize bumble bee nesting behavior, how to avoid impacts to individual bumble bees, and when to contact a qualified biologist for additional investigation of bumble bee occurrences or potential nests. • Have a qualified biologist assess habitat suitability to determine if the activity occurs in an area providing suitable habitat for foraging or nesting CBB, and if so, identify areas providing suitable habitat to inform surveys. • Have a qualified biologist conduct surveys to determine whether foraging CBB and/or CBB nests are present. • If a CBB nest is present in the work area, implement a no-disturbance buffer around the nest and provide a biological monitor until it is determined the buffer is sufficient to protect the nest. If CBB are present in the work area, provide a biological monitor until CBB are no longer present. • If no CBB nests or adults are present, no further surveys need to be done for the remainder of the flight season. However, depending on the project activities, a qualified biologist may need to be onsite to prescribe additional surveys and/or monitoring to meet the requirements of the avoidance and minimization measures for CBB. 1.
GEN-11	Avoidance and protection of Salt Marsh Harvest Mouse, California Ridgway's Rail, and California Black Rail	1. For maintenance activities occurring within the range of the salt marsh harvest mouse (SMHM), California Ridgway's rail (CRR), or California black rail (CBR), as defined in Valley Water's GIS layers, a qualified biologist will conduct a desk audit to determine whether potentially suitable habitat for one or more of these species may be present within, adjacent to (defined as within 50 feet for SMHM, 50 feet for CRR and CBR outside the nesting season, and 700 feet for CRR and CBR during the nesting season) of the

BMP Number	BMP Title	BMP Description
		maintenance activity area, including both work locations and access routes. The nesting season for CRR and CBR is defined as February 1 to August 31. 2. All SMP activities within 700 feet of occupied or potentially occupied CRR or CBR nesting habitat, as determined by a qualified biologist, shall be avoided during the nesting season, with the following exception: a. CRR are assumed to be nesting within 700 feet of the Palo Alto Flood Basin tide gate, albeit on the outboard side of the levees (e.g., on Hooks Isle or in the Palo Alto Estuary) rather than in the Palo Alto Flood Control Basin, and SMHM may be present in vegetation near the tide gate. If a blockage at the Palo Alto Flood Basin tide gate occurs, trash and debris removal may be performed under the following conditions: i. Trash and debris removal shall occur at the Palo Alto Flood Basin tide gate in January prior to the nesting season of each year to minimize the potential of a blockage accumulating during the nesting season. ii. Blockages will only be cleared during the nesting season in response to an immediate and urgent issue (rather than as part of regular maintenance activities). It is expected that blockages will only need to be cleared once or twice during the Program Renewal period. If blockages require clearing more frequently, this exception will be revisited in consultation with the CDFW and USFWS. In cases where tide gate blockages need to be cleared in response to an immediate and urgent issue during the nesting season, Valley Water will notify CDFW within 24 hours following the work. iii. A qualified biologist familiar with the identification and biology of the CRR and SMHM will monitor the removal of trash and debris from the tide gate. The biologist will perform the following duties: 1. Provide recommendations to minimize noise and visual disturbances to CRR nesting in nearby areas, especially for activities on the downstream side of the tide gate, and to avoid impacts on SMHM. 2. Ensure that activities are limited to the minimum necessary to clear the blockage sufficiently for the remainder nesting season, and no more than 2 hours in duration. 3. Stop work if a SMHM is observed in, or a CRR is observed within 50 feet of the work area. 3. Within seven days prior to work within or adjacent to suitable habitat, a qualified biologist will survey the work area, access routes, and immediately adjacent areas (defined as areas within 50 feet) to identify suitable habitat areas for SMHM, CRR, and CBR. Specific habitat areas are defined as tidal habitat with vegetated areas of cordgrass, marsh gumplant, pickleweed, alkali heath, bulrush, and other marsh vegetation; brackish marsh reaches of creeks with heavy accumulations of bulrush thatch (old stands); and high-water refugial habitat that may include annual grasses and shrubs immediately adjacent to the marsh

BMP Number	BMP Title	BMP Description
		vegetation described above. If rails are observed during this survey, a qualified biologist will conduct an additional survey immediately prior to initiation of SMP activities. A no-disturbance buffer (minimum of 50 feet) will be implemented. 4. Activities located within or immediately adjacent to (i.e., within 50 feet of) suitable habitat will not occur within two hours before or after extreme high tides (6.5 feet or above) when the marsh plain is inundated, because protective cover for those species is limited and activities could prevent individuals from reaching available cover or flush them from high-water refugia. 5. Within the identified suitable habitat areas, vegetation will be removed by hand from areas to be directly impacted by the work activities if possible (hand removal of vegetation in some channels may not be possible). Within the mapped range of these species but outside of areas identified as suitable habitat, other methods (e.g., mechanized hand tools or mowing) may be possible. Mowing using heavy equipment (tractors, boom mowers, and rider mowers) will not be conducted in habitat areas or within 50 feet of habitat areas. 6. If suitable habitat occurs within or adjacent to (defined as within 50 feet of) the work area, a qualified biologist will conduct a pre-activity survey of all suitable habitat that may be directly or indirectly impacted by the day's activities (work area, access routes, staging areas). This survey will be conducted prior to the initiation of work each day for all vegetation management activities including ground or vegetation disturbance, operation of large equipment, grading, sediment removal, and bank stabilization work. a. If during the initial daily survey or during work activities, a CRR or CBR is observed within or immediately adjacent to the work area (defined as within 50 feet), work will be suspended until the individual leaves the area on its own. b. If, during the initial daily survey or during work activities, a SMHM, or an animal that could potentially be a SMHM, is observed within or immediately adjacent to the work area (defined as within 50 feet), initiation of work will be delayed until a *plan* can be developed and implemented by a qualified biologist to protect the rodent. Acceptable plan activities may include one or more of the following activities: 1) establishment of a buffer zone at least 50 feet in radius from the rodent; 2) ongoing active monitoring; 3) construction of silt fence barrier between maintenance work and location of the rodent; 4) delay of work activity until the qualified biologist can provide CDFW and USFWS with a suggested course of action and seek concurrence. 7. If work is necessary within 50 feet of suitable habitat areas, the qualified biologist will remain on-site to monitor the work. 8. If dense herbaceous vegetation (e.g., fennel with dense bases) or dense woody vegetation (e.g., coyote brush) will be removed, it may be difficult for the qualified biologist to detect individual SMHM, or nests

BMP Number	BMP Title	BMP Description
		of this species, before the vegetation is removed. To ensure that any individuals or nests of this species are detected, the following procedures will be followed: a. A qualified biologist will search the vegetation for SMHM and their nests. If they are able to adequately survey the entire plant, then a chainsaw or other mechanized equipment may be used to remove the vegetation. If the biologist is not able to adequately survey vegetation to be removed due to the presence of dense vegetation, they will initially search as much of this vegetation as feasible (e.g., the upper, less dense portions). b. At the direction of the biologist, the maintenance crew will use either mechanized or non-mechanized hand tools to remove the portion of the vegetation that the biologist was able to search adequately (e.g., the outer branches or upper portion of the plant) under close supervision. Mechanized hand tools may be appropriate for large woody vegetation or tall herbaceous vegetation (such as weeds on levees), and non-mechanized hand tools may be appropriate for dense herbaceous marsh vegetation (such as pickleweed). c. Once the outer/upper portions of the vegetation have been removed, the biologist will then re-survey the remaining vegetation. d. This process (a–c) will be repeated iteratively until the biologist is able to search all vegetation thoroughly and the vegetation has been removed. 9. See ANI-2 for restrictions on pesticide use near SMHM, CRR, and CBR habitat. 10. If visual observation cannot confirm that a SMHM, CRR, or CBR has left the work area, then it is assumed that the individual(s) remains in the work area and the work will not resume until the area has been thoroughly surveyed (and absence confirmed) or CDFW and USFWS have been contacted for guidance. 11. When grazing occurs in or near SMHM habitat, a qualified biologist will guide fence installation to exclude grazing animals from SMHM-specific habitat. Once exclusion fencing has been installed, a biologist does not need to be on site to monitor grazing.
BMP GEN-12	Protection of California Red-Legged Frogs and California Tiger Salamanders	A qualified biologist will conduct a desk audit to determine whether suitable habitat for California red-legged frogs (CRLF) and/or California tiger salamanders (CTS) is present in or adjacent to a maintenance activity based on all available information, including the habitats modeled in the VHP. If the qualified biologist determines that one or both of these species are likely to be encountered within the work area, the pre-activity surveys described below will be performed. <u>Pre-Activity Surveys (for Activities Not Covered Under the VHP)</u> 1. A qualified biologist will conduct a single daytime survey within a 7-day period preceding the onset of maintenance activities. 2. If the qualified biologist conducting the desktop audit determines a high likelihood that CRLF and/or CTS may be encountered during the work, an additional nighttime survey will also be conducted.

BMP Number	BMP Title	BMP Description
		3. If an individual CRLF and/or CTS is observed within the work area during either the daytime or nighttime pre-activity survey, the following additional surveys will be conducted: a. For activities that will not result in ground disturbance and for vegetation removal activities that will take less than 1 day, a qualified biologist will conduct a single pre-activity survey prior to the start of work on the first day that work occurs. b. For maintenance activities that involve ground disturbance and vegetation removal activities that will take more than one day, the qualified biologist shall conduct a pre-activity survey on each morning of and prior to the scheduled work commencing. If no CRLF or CTS are found during the pre-activity surveys, the work may proceed. If CRLF or CTS of any life stage are detected during the surveys and/or during the course of maintenance activities, the measures listed under *Protection of Individuals* below will be implemented. <u>Pre-Activity Survey (for VHP-Covered Activities)</u> This survey is not required by the VHP but may be implemented by Valley Water on a voluntary basis. 1. A qualified biologist will conduct a single daytime survey within a seven-day period preceding the onset of maintenance activities. If the qualified biologist deems it appropriate based on their professional judgement, a night survey for CRLF and/or CTS may also be conducted within a seven-day period preceding the onset of maintenance activities. If no CRLF or CTS are found during the pre-activity survey, the work may proceed. If CTS of any life stage are detected during the surveys and/or during the course of maintenance activities, the measures listed under *Protection of Individuals* below will be implemented. <u>Protection of Individuals (All Activities)</u> These protection measures are not required under the VHP but may be implemented by Valley Water on a voluntary basis for VHP-covered projects. These measures are required for projects that are not covered under the VHP. If CRLF or CTS eggs or larvae are found, a buffer will be established by a qualified biologist around the location of the eggs/larvae and work may proceed outside of the buffer zone. Work within the buffer zone will be rescheduled until the time that eggs have hatched and/or larvae have metamorphosed, and species has moved out of the area. If CRLF or CTS adults or non-larval juveniles are found, one of the following two procedures will be implemented: 1. If, in the opinion of the qualified biologist, capture and removal of the individual to a safe place outside of the work area is less likely to result in adverse effects than leaving the individual in place and rescheduling

BMP Number	BMP Title	BMP Description
		the work (e.g., if the species could potentially hide and be missed during a follow-up survey), the individual will be captured and relocated by a qualified biologist (with USFWS approval for the CRLF or both USFWS and CDFW approval for the CTS), and work may proceed. 2. If, in the opinion of the qualified biologist, the individual is likely to leave the work area on its own and work can be feasibly rescheduled, a buffer will be established around the location of the individual(s) and work may proceed outside of the buffer zone. Work within the buffer zone will be rescheduled. During animal conflict management activities, if CRLF or CTS are found within a burrow proposed for destruction, a qualified biologist will determine an appropriate buffer distance around that burrow to ensure adequate protection of the habitat. The buffer area may include not destroying adjacent burrows, as that may damage the subterranean networks of the occupied burrow or produce substrate vibrations that could interfere with prey detection mechanisms. If two consecutive follow-up surveys are conducted (spaced 30 days apart) in which the burrow is found to be unoccupied, work can proceed as planned. A naturally found back-filled burrow known to have been inhabited by a CRLF or CTS will be presumed to still be occupied by that species, and a clearly delineated buffer demarcation of the burrow area will be in place for the duration of nearby work activities. In rare instances in which destruction of the burrow is not avoidable during animal conflict management, the animal will be relocated to a safe burrow outside the impact area, with USFWS approval for the CRLF or USFWS and CDFW approval for the CTS. A biologist will observe the relocated animal until it is certain that the animal is not in immediate danger of desiccation or predation. <u>Site-Specific Species Protection (for Activities Not Covered Under the VHP)</u> For Sediment Removal and Bank Stabilization Projects that are not covered under the VHP, if CRLF or CTS of any life stage are found, the qualified biologist, in cooperation with the project proponent, shall complete a site-specific plan to protect individuals for the project. Elements of the plan may include work rescheduling, training work crews, daily surveys, establishment of buffers and buffer fencing, on-site monitoring, habitat modification in advance of work activities, capture and relocation of individuals, methods of documentation, and reporting of results.
BMP GEN-13	Protection of Foothill Yellow-Legged Frogs	A qualified biologist will conduct a desk audit to determine whether suitable habitat for foothill yellow-legged frogs (FYLF) is present in or adjacent to a maintenance activity based on all available information, including the habitats modeled in the VHP. If the qualified biologist determines that this species is likely to be encountered within the work area, the pre-activity surveys described below will be performed. Pre-Activity Surveys (for Activities Not Covered Under the VHP) 1. A qualified biologist will conduct a single daytime survey within a seven-day period preceding the onset of maintenance activities.

BMP Number	BMP Title	BMP Description
		2. If an individual FYLF is observed within the work area during the daytime pre-activity survey, the following additional surveys are required: a. For activities that will not result in ground disturbance and for vegetation removal activities that will take less than one day, a qualified biologist will conduct a single pre-activity survey prior to the start of work on the first day that work occurs. b. For maintenance activities that involve ground disturbance, and vegetation removal activities that will take more than 1 day, the qualified biologist shall conduct a pre-activity survey on each morning of and prior to the scheduled work commencing. If no FYLF are found during the pre-activity surveys, the work may proceed. If FYLF of any life stage are detected during the surveys and/or during the course of maintenance activities, the qualified biologist may elect to implement additional pre-activity surveys prior to start of work as described and may implement the measures listed under *Protection of Individuals* below. Pre-Activity Survey (for VHP-Covered Activities) This survey is not required under the VHP but may be implemented by Valley Water on a voluntary basis. 1. A qualified biologist will conduct a single daytime survey within a 7-day period preceding the onset of maintenance activities. If no FYLF are found during the pre-activity surveys, the work may proceed. If FYLF of any life stage are detected during the surveys and/or during the course of maintenance activities, the measures listed under *Protection of Individuals* below will be implemented. <u>Protection of Individuals (All Activities)</u> These protection measures are not required under the VHP but may be implemented by Valley Water on a voluntary basis for VHP-covered projects. These measures are required for projects that are not covered under the VHP. If FYLF eggs or larvae are found, a buffer will be established by a qualified biologist around the location of the eggs/larvae and work may proceed outside of the buffer zone. Work within the buffer zone will be rescheduled until the time that eggs have hatched and/or larvae have metamorphosed, and species has moved out of the area. If FYLF adults or non-larval juveniles are found, one of the following two procedures will be implemented: 1. If, in the opinion of the qualified biologist, capture and removal of the individual to a safe place outside of the work area is less likely to result in adverse effects than leaving the individual in place and rescheduling the work (e.g., if the species could potentially hide and be missed during a follow-up

BMP Number	BMP Title	BMP Description
		survey), the individual will be captured and relocated by a qualified biologist (with CDFW approval), and work may proceed. 2. If, in the opinion of the qualified biologist, the individual is likely to leave the work area on its own and work can be feasibly rescheduled, a buffer will be established around the location of the individual(s) and work may proceed outside of the buffer zone. Work within the buffer zone will be rescheduled. Site-Specific Species Protection (for Activities Not Covered Under the VHP) For Sediment Removal and Bank Stabilization Projects not covered under the VHP, if FYLF of any life stage are found, the qualified biologist in cooperation with the project proponent shall complete a site-specific plan to protect individuals for the project. Elements of the plan may include work rescheduling, training work crews, daily surveys, establishment of buffers and buffer fencing, on-site monitoring, habitat modification in advance of work activities, capture and relocation of individuals, methods of documentation, and reporting of results.
BMP GEN-14	Protection of Northwestern Pond Turtles	A qualified biologist will conduct a desk audit to determine whether suitable habitat for northwestern pond turtles (NWPT) is present in or adjacent to a maintenance activity based on all available information, including the habitats modeled in the VHP. If the qualified biologist determines that this species is likely to be encountered within the work area, the pre-activity surveys described below will be performed. Pre-Activity Surveys (for Activities Not Covered Under the VHP) 1. A qualified biologist will conduct a single daytime survey within a 7-day period preceding the onset of maintenance activities for NWPT and nests of this species. 2. If an individual NWPT is observed within the work area during the daytime pre-activity survey, the following additional surveys are required: a. For activities that will not result in ground disturbance and for vegetation removal activities that will take less than 1 day, a qualified biologist will conduct a single pre-activity survey prior to the start of work on the first day that work occurs. b. For maintenance activities that involve ground disturbance and vegetation removal activities that will take more than 1 day, the qualified biologist shall conduct a pre-activity survey on each morning of and prior to the scheduled work commencing. If no NWPT are found during the pre-activity surveys, the work may proceed. If NWPT of any life stage are detected during the surveys and/or during the course of maintenance activities, the measures listed under *Protection of Individuals* below will be implemented. Pre-Activity Survey (for VHP-Covered Activities) This survey is not required under the VHP but may be implemented by Valley Water on a voluntary basis.

BMP Number	BMP Title	BMP Description
		1. A qualified biologist will conduct a single daytime survey within a seven-day period preceding the onset of maintenance activities for NWPT and nests of this species. If no NWPT are found during the pre-activity surveys, the work may proceed. If NWPT of any life stage are detected during the surveys and/or during the course of maintenance activities, the measures listed under *Protection of Individuals* below will be implemented. Protection of Individuals (All Activities) These protection measures are not required under the VHP but may be implemented by Valley Water on a voluntary basis for VHP-covered projects. These measures are required for projects that are not covered under the VHP. If an active NWPT nest is detected within the activity area, a 50-foot buffer zone will be established and maintained around the nest during the breeding and nesting seasons (April 1 – August 31). The buffer zone will remain in place until the young have left the nest, as determined by a qualified biologist. If NWPT adults or juveniles are found, one of the following two procedures will be implemented: 1. If, in the opinion of the qualified biologist, capture and removal of the individual to a safe place outside of the work area is less likely to result in adverse effects than leaving the individual in place and rescheduling the work (e.g., if the species could potentially hide and be missed during a follow-up survey), the individual will be captured and relocated by a qualified biologist (with CDFW approval), and work may proceed. The individual will be relocated to a suitable site within the same watershed and within 500 meters of its original location unless it is first tested and determined to be free of shell-wasting disease. 2. If, in the opinion of the qualified biologist, the individual is likely to leave the work area on its own and work can be feasibly rescheduled, a buffer will be established around the location of the individual(s) and work may proceed outside of the buffer zone. A qualified biologist or biological monitor will monitor the individual(s) and modify the buffer if needed. Work within the buffer zone will be rescheduled. Site-Specific Species Protection (for Activities Not Covered Under the VHP) For Sediment Removal and Bank Stabilization Projects, if NWPT of any life stage are found, the qualified biologist in cooperation with the project proponent shall complete a site-specific plan to protect individuals for the project. Elements of the plan may include work rescheduling, training work crews, daily surveys, establishment of buffers and buffer fencing, on-site monitoring, habitat modification in advance of work activities, capture and relocation of individuals, methods of documentation, and reporting of results.

BMP Number	BMP Title	BMP Description
BMP GEN-15	Prevention of Spread or Mobilization of Pathogens and Invasive Plants	To minimize the potential for introduction or spread of amphibian and NWPT pathogens, the following measures (or other similar measures) will be implemented during qualified biologists' work in aquatic habitats potentially supporting special-status amphibians and/or NWPT: • Sampling and field gear will be disinfected after exiting one aquatic habitat and before entering the next aquatic habitat, unless the waters are hydrologically connected to one another. • All organic matter will be removed from nets, traps, boots, vehicle tires, and all other surfaces that have come into contact with water or potentially contaminated sediments. These items will then be rinsed with clean water before entering the next aquatic habitat, unless the waters are hydrologically connected to one another. • Boots, nets, traps, hands, etc., will be scrubbed with a bleach solution (0.5 to 1.0 cup per 1.0 gallon of water), Quat-128™ (1:60), or a 3 to 6 percent sodium hypochlorite solution and thoroughly rinsed clean with water between study sites. Equipment will be rinsed clean with water between study sites. Cleaning equipment in the immediate vicinity of aquatic habitats will be avoided (e.g., clean in an area at least 100 feet from aquatic features). Care will be taken so that all traces of the disinfectant are removed before entering the next aquatic habitat. If the waters are hydrologically connected to one another, disinfecting equipment does not need to occur between habitats. • When working at sites with known or suspected disease problems, disposable gloves will be worn and changed between handling each animal. Gloves will be wetted with water from the site or distilled water prior to handling any amphibians. Gloves will be removed by turning inside out with hands cleaned using a hand cleaner and water rinse to minimize cross-contamination. • If an individual of any amphibian species, or a NWPT, is found and appears to be infected by a pathogen, it will not be moved off-site. Rather, the USFWS and CDFW will be contacted for guidance on the disposition of the individual. • If amphibians or NWPT need to be relocated to avoid injury or mortality of individuals, they will be relocated the minimum distance necessary to move them to suitable habitat outside the maintenance area. Relocations will follow processes described in species-specific BMPs. NWPT will be relocated only within the same watershed and within 500 meters of their original location, unless they are first tested and determined to be free of shell-wasting disease. To minimize the potential for introduction and spread of *Phytophthora* during revegetation work: • Container stock used at revegetation sites will be sourced from nurseries in compliance with the *Guidelines to Minimize Phytophthora Pathogens in Restoration Nurseries* (Working Group for Phytophthoras in Native Habitats, 2016) whenever feasible. Valley Water may adopt newer guidelines as they become available.

BMP Number	BMP Title	BMP Description
		To minimize the potential for introduction or spread of *Phytophthora* and invasive plants to sensitive plant communities, the following measures (or other similar measures) will be implemented for any SMP activities immediately adjacent to (especially upslope from) serpentine plant communities: • Before arrival at the site, equipment, vehicles, and tools will be free of soil, including debris on tires, wheel wells, vehicle undercarriages, and other surfaces. A high-pressure washer and/or compressed air may be used (at an off-site location) to ensure that soil and debris are completely removed. Vehicles that travel and park only on paved public roads and that do not carry mud, soil, gravel, or plant material from off-site locations do not require external cleaning. The interior of vehicles and equipment (e.g., cabs) must be free of mud, soil, gravel, and other debris (e.g., vacuumed, swept, or washed). • Prior to arrival at the site, small tools and equipment must be washed to be free of soil or other contamination, and they must be sanitized. Wood handles on tools should be sealed with a waterproof coating to make them easier to sanitize. Before sanitizing, all soil and organic material (roots, sap, etc.) will be removed from the surface. If necessary, a detergent solution and brush will be used to scrub off surface contaminants. A sanitizing agent may also be used as a cleaning fluid. Screwdrivers or similar implements may be needed to clean soil out of crevices or shoe treads. Brushes and other implements used to help remove soil will be cleaned and sanitized after use. • Sanitization procedures will occur after surface soil and debris are removed. Surfaces will be treated with a sanitizing agent, allowing the appropriate contact time before use or rinsing. If surfaces are clean and dry, they will be thoroughly wetted and allowed to rest for the appropriate contact time. If the sanitizer has been used to help clean the surface, fresh sanitizer should be used to rinse off any dirty solution, and again, the equipment should be allowed to rest for the required contact time. If treated surfaces are wetted with water, the sanitizing solution may become diluted; enough sanitizer should be applied to completely displace the water film. Sanitizing agents may be applied by using spray bottles and thoroughly wetting the surface. All appropriate safety precautions will be observed to prevent contact with eyes or skin when using these agents. • Sanitizing agents may include 70 to 90 percent ethyl or isopropyl alcohol (sprayed to thoroughly wet the surface and allowed to air dry before use); freshly diluted bleach solution (0.525 percent sodium hypochlorite) for a minimum of 1 minute (due to corrosivity, not advised for steel or other materials damaged by bleach); or 2,000 parts per million (ppm) quaternary ammonium disinfectant for 1 minute (or according to manufacturer recommendations for use against *Phytophthora*), freshly made to ensure target concentrations. • Footwear must be free of debris and soil before arriving at the site and should be cleaned and disinfected before starting work each day. At the start of work at each new job site, workers' clothes

BMP Number	BMP Title	BMP Description
		should be free of all mud, soil, or plant debris. If clothes are not freshly laundered, remove all debris and adhered soil with a stiff brush. • Soil and plant debris will be cleaned from equipment and hand tools, buckets, and gloves. • To the degree feasible, work activities in or immediately adjacent to (especially upslope from) serpentine communities should be scheduled to avoid rainy periods or times when soil is very wet and more likely to contaminate equipment. • Materials used for erosion control will be clean, new, sanitized, or otherwise have a low risk of *Phytophthora* contamination. Erosion control methods will be implemented in a manner that directs surface water flow away from sensitive plant species and communities. • Mulch, compost, soil amendments, and other revegetation materials must be determined to be low-risk for *Phytophthora* introduction, if used. Irrigation system components (e.g., pipe, fittings, valves, driplines, and emitters), erosion control fabric, fencing, stakes, posts, and other planting site materials must be new or sanitized.
GEN-16	Protection of Bats and Bat Colonies	1. A qualified biologist will conduct a desk audit to determine whether suitable habitat (appropriate roost trees or anthropogenic structures) is present for bats and/or bat colonies within 100 feet of the work site, staging areas, or access routes. 2. If potential bat and/or bat colony habitat is determined to be present, a qualified biologist will conduct a survey within two weeks prior to the onset of work activities to look for evidence of bat use. If evidence is observed, or if potential roost sites are present in areas where evidence of bat use might not be detectable (such as a tree cavity), an evening survey and/or nocturnal acoustic survey may be necessary to determine if the bat colony is active and to identify the specific location of the bat colony. 3. If an active bat colony is present then the qualified biologist will make the following determinations: a. The work can proceed without unduly disturbing the bat colony. b. There is a need for a buffer zone to prevent disturbance to the bat colony, and implementation of the buffer zone (determined on a case-by-case basis by a qualified biologist) will reduce or eliminate the disturbance to an acceptable level. 4. If a bat and/or bat colony is found in a tree or structure that must be removed or physically disturbed, the qualified biologist will consult with the CDFW prior to initiating any removal or exclusion activities.
GEN-17	Protection of San Francisco Dusky-footed Woodrat	Prior to work within riparian, oak woodland, or coyote brush scrub habitats or the removal of any oak trees outside these habitats, a qualified biologist will conduct a desk audit to determine whether woodrats are known to be present within or adjacent to the work location or if a suitable habitat is present. 1. If the biologist determines that woodrats are known to be present at the work location or suitable habitat is present and the presence/absence of woodrats is unknown AND the maintenance activity would result in the disturbance of suitable habitat or woodrat nests (if present), a pre-activity survey for this species will be performed.

BMP Number	BMP Title	BMP Description
		2. If no woodrat habitat is present, or if there is habitat present but it will not be affected by the maintenance activity, then no further action is required. Pre-Activity Survey If required, a qualified biologist shall conduct a pre-activity survey within 2 weeks prior to the start of maintenance activities to determine if woodrat nests are present within the immediate activity area or a surrounding 5-foot buffer. If no woodrat nests are found during the pre-activity survey, the work may proceed. If woodrat nests are detected during the survey and/or during the course of maintenance activities, the measures listed under *Protection of Individuals* below will be implemented. <u>Protection of Individuals</u> If woodrat nests are determined to be present, the following measures will be implemented: 1. To the extent feasible, impacts on woodrat nests will be avoided by maintaining a minimum 5-foot buffer between maintenance activities and nests. Even if a 5-foot buffer cannot be maintained, Valley Water will minimize impacts to nests by avoiding the direct destruction or modification of the nests to the extent feasible. 2. If one or more woodrat nests are determined to be present and physical disturbance or destruction of the nests cannot be avoided, then the woodrats shall be evicted from their nests and the nest material relocated outside of the disturbance area, prior to onset of activities that would disturb the nest to avoid injury or mortality of the woodrats. CDFW will be notified before any relocation activities and relocations will follow the plan described below. a. First, an alternate location for the nest material shall be chosen by a qualified biologist based on the following criteria: 1) proximity to current nest location; 2) safe buffer distance from planned work; 3) availability of food resources; and 4) availability of cover. b. An alternate nest structure will then be built at the chosen location. The structure will be made up of small logs (e.g., available materials 2 inches in diameter or greater) stacked to provide a foundation on which the woodrats can add nest material. Alternatively, a suitable artificial nest box may be used. c. Subsequently, during the evening hours (i.e., within two hours prior to sunset), a qualified biologist will slowly dismantle the existing woodrat nest to allow any woodrats to flee and seek cover. All sticks from the nest will be collected and spread over the alternate structure. If young woodrats that are still dependent on their mother are discovered, relocation efforts will cease for the evening; relocation efforts will then proceed a minimum of two weeks later (following a

BMP Number	BMP Title	BMP Description
		survey by a qualified biologist that determines that dependent young are no longer present), or CDFW will be contacted for guidance on how to proceed.
GEN-18	Salvage Native Aquatic Vertebrates from Dewatered Channels	If fisheries or native aquatic vertebrates are present when cofferdams, water bypass structures, and silt barriers are to be installed, a fish and native aquatic vertebrate relocation plan shall be implemented to ensure that fish and native aquatic vertebrates are not stranded. Relocation efforts will be based on the following: 1. In non-tidal channels where water is to be diverted, prior to the start of work or during the installation of water diversion structures, native aquatic vertebrates including the targeted salvage of Pacific lamprey ammocetes following methods outlined in the Lamprey Technical Workgroup (2020) Appendix C, shall be captured in the work area and transferred to another reach as determined by a qualified biologist. 2. Timing of work in streams that support a significant number of amphibians will be delayed until metamorphosis occurs to minimize impacts to the resource. 3. Capture and relocation of aquatic native vertebrates is not required at individual work sites when site conditions preclude reasonably effective operation of capture gear and equipment. 4. Aquatic invertebrates will not be transferred (other than incidental catches) because of their anticipated abundance and colonization after completion of the repair work. Streams that support a sensitive species (i.e., steelhead, Pacific lamprey) will require a relocation effort and/ or initial onsite monitoring by a qualified biologist, depending on seasonal conditions.
GEN-19	Avoidance of Impacts on the San Joaquin Kit Fox	A qualified biologist will conduct a desk audit to determine whether a maintenance activity will occur in an area where the San Joaquin kit fox could potentially occur (based on VHP habitat mapping and CNDDB records) and in potential habitat for the species. If the biologist determines that the maintenance activity could occur in an area where San Joaquin kit foxes are potentially present, a pre-activity survey for this species will be performed as described below. <u>Pre-Activity Surveys</u> If the biologist determines that an SMP activity could occur in an area that could potentially support a kit fox, Valley Water will implement applicable pre-activity surveys and other measures in accordance with the USFWS's *San Joaquin Kit Fox Survey Protocol for the Northern Range*, as follows: a) Conduct a pre-activity survey no less than 14 days and no more than 30 days prior to the beginning of project implementation. Surveys shall identify kit fox habitat features on the project site, evaluate their use by kit fox, and, if possible, assess the potential impacts on the kit fox of the proposed activity. The status of all dens shall be determined and mapped in accordance with the survey protocol.

BMP Number	BMP Title	BMP Description
		b) If a natal/pupping den is discovered within the project area or within 200 feet of the project boundary, the USFWS and CDFW shall be immediately notified. Disturbance or destruction to all San Joaquin kit fox dens should be avoided. Destruction or disturbance of any known or natal/pupping kit fox den would require authorization from the USFWS and CDFW. c) The project proponent will establish exclusion zones around the kit fox dens, if determined to be present. The configuration of the exclusion should have a radius measured outward from the entrance or cluster of entrances. The following radii are minima to be applied: ▪ Potential den: 50 feet ▪ Known den: 100 feet ▪ Natal/pupping den: USFWS and CDFW must be contacted (occupied and unoccupied) ▪ Atypical den: 50 feet If take of the San Joaquin kit fox will occur, take authorization from the USFWS and CDFW will be necessary.
GEN-20	Hazard Tree Removal	The following requirements apply to hazard tree removal activities occurring under the SMP: • No soil disturbance, aside from superficial disturbance of the ground surface (such as when a tree is dragged), will occur during hazard tree remediation activities. • If tree removal activities not covered under the VHP result in the removal of more than five adjacent trees, each 12-inch diameter at breast height or larger, or a stand of trees with a canopy area equal to or larger than 2,000 square feet, Valley Water will revegetate the affected area with some native woody vegetation components. These native trees and/or shrubs will be selected by a qualified biologist and/or vegetation management professional to determine suitability for the local site and will be planted to best encourage re-establishment of native woody riparian vegetation in the larger canopy gap. • No tree known to have been occupied (based on CNDDB records, other available information, or a pre-activity survey) by an active Swainson's hawk, bald eagle, or golden eagle nest within the prior five years would be removed under the Program.

BMP Number	BMP Title	BMP Description
		General Maintenance Practices
GEN-21	In-Channel Minor Activities	For in-channel minor work activities, work will be conducted from the top of the bank if access is available and there are flows in the channel.
GEN-22	Employee/Contractor Training	All appropriate Valley Water staff and contractors will receive annual training on SMP BMPs. The training will also include an overview of special-status species identification and habitat requirements. Valley Water staff and contractors will receive fact sheets to assist with in-the-field identification of special-status species and their habitats. For Valley Water staff and contractors who may be working in streams which are habitat for sensitive salmonid species, this training will include a salmonid education awareness training which will emphasize methods to cross a stream and work in water that avoid or minimize impacts to water quality and salmonid habitat. These methods are presented in a salmonid BMP pamphlet distributed to all field crews at the time of the annual training. This pamphlet includes a list of steelhead creeks in the county, a diagram of the best areas to cross creek channels, and methods to avoid or minimize impacts to salmonid habitat.
GEN-23	Paperwork Required On Site	1. Copies of regulatory permits related to the SMP will be kept on-site and available for review, if requested by regulatory personnel. All Valley Water staff will be familiar with the requirements outlined in the SMP permits. 2. Copies of the SMP Manual and this BMP Manual will be kept on-site.
GEN-24	Work Site Housekeeping	1. Valley Water employees and contractors will maintain the work site in neat and orderly conditions on a daily basis, and will leave the site in a neat, clean, and orderly condition when work is complete. 2. Slash, sawdust, cuttings, etc. will be removed to clear the site of vegetation debris. As needed, paved access roads and trails will be swept and cleared of any residual vegetation or dirt resulting from the maintenance activity. 3. For activities that last more than one day, materials or equipment left on the site overnight will be stored as inconspicuously as possible and will be neatly arranged. Any materials and equipment left on the site overnight will be stored to avoid erosion, leaks, or other potential impacts to water quality (see BMP GEN-25). 4. Valley Water's maintenance crews are responsible for properly removing and disposing of all debris incurred as a result of construction within 72 hours of project completion. 5. All trash that is brought to a project site during maintenance activities (e.g., plastic water bottles, plastic lunch bags, and cigarettes) will be collected at the site daily and disposed of at an appropriate disposal site.
GEN-25	Erosion and Sediment Control Measures	1. Erosion control measures will be implemented so that the site is stabilized and water quality is protected prior to significant rainfall. The channel bed and areas below the Ordinary High-Water Mark (OHWM) are exempt from this BMP.

BMP Number	BMP Title	BMP Description
		2. Erosion control fabrics will consist of natural fibers where feasible; however, steeper slopes and areas that are highly erodible may require more structured erosion control methods. No non-porous fabric will be used as part of a permanent erosion control approach. Plastic sheeting may be used to temporarily protect a slope from runoff, but only if there are no indications that special-status species would be impacted by the application. 3. Erosion control measures will be installed according to manufacturer's specifications and following the California Stormwater Quality Association (CASQA) Construction Stormwater Best Management Practice Handbook guidelines. 4. Erosion control measures may include, but are not limited to silt fences, straw bale barriers, brush or rock filters, storm drain inlet protection, temporary sediment traps, temporary sediment basins, erosion control blankets and mats, soil stabilization (i.e., tackified straw with seed, jute or geotextile blankets, etc.), wood chips, and straw mulch. Geotextile fabric will only be used when biodegradable materials (e.g., straw matting, erosion control blankets) are determined to be ineffective or infeasible. 5. Where necessary to minimize soil from being tracked onto streets near work sites, construction entrances and exits will be stabilized. 6. All temporary construction-related erosion control methods will be removed at the completion of the project. 7. At no time will oily, greasy, or sediment-laden runoff be allowed to enter or be placed where it may later enter any waterway. Any active non-stormwater discharge will cease immediately. Corrective actions will be implemented before the next rain event, but no longer than 10 business days after the potential and/or actual discharges are discovered. If more than 10 business days are required for compliance, a rationale will be recorded. 8. All necessary and adequate precautions will be taken to prevent the project from increasing the turbidity of any watercourse flowing past the construction site. Where natural turbidity is between 0 and 50 NTU, waters will be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. Where natural turbidity is greater than 50 NTU, increases will not exceed 10 percent. Where the receiving water body is a dry creek bed or storm drain, waters in excess of 50 NTU will not be discharged from the work area. Active non-stormwater discharges and visual increases in turbidity must be immediately reported to Valley Water's SMP Implementation Project Manager. 9. Each maintenance site will be visually inspected at least once daily during extended storm events to confirm that BMPs are effective and maintained as necessary. Each maintenance site will be visually inspected within two business days (48 hours) after each significant rain event to determine whether BMPs were effective and identify the need to modify or maintain existing BMPs or include additional BMPs to be protective. Modifications, repairs, and improvements to erosion control measures will be made as needed to protect water quality.

BMP Number	BMP Title	BMP Description
		10. Starting September 1, 72-hour weather forecasts will be monitored daily, and sites must be maintained so that they can be rapidly winterized. Winterization is the process of maintaining work sites and preparing them for rainfall with the appropriate BMPs to prevent erosion and sediment transport and protect water quality. Winterization occurs upon completion of work activities or, on incomplete projects, prior to the occurrence of forecasted rainfall of at least 25% chance of 0.10 inch in 24 hours.
GEN-26	Staging and Stockpiling of Materials	1. To protect on-site vegetation and water quality, staging areas will be located on access roads, surface streets, or other disturbed areas that are already compacted and only support ruderal vegetation and be located outside of sensitive habitats. Similarly, all maintenance equipment and materials (e.g., road rock and project spoil) will be contained within the existing service roads, paved roads, or other pre-determined staging areas. 2. Building materials and other maintenance-related materials, including chemicals and sediment, will not be stockpiled or stored where they could spill into waterbodies or storm drains. 3. Materials with decaying organic material or other potentially odorous materials will be handled in a manner that avoids impacting residential areas and other sensitive receptors. Any odorous materials will not be stockpiled longer than seven calendar days on site. 4. Runoff from the staging areas will not be allowed to enter waterways, including the creek channel or storm drains, without being subjected to adequate filtration (e.g., vegetated buffer, swale, hay wattles or bales, silt screens). 5. The discharge of decant water into waterways from any on-site temporary sediment stockpile or storage area is prohibited. 6. Wet material removed from an isolated creek reach may be pulled to the side of the channel (within the channel and below top of bank) and allowed to naturally drain prior to removal from the channel. Pulled material will be removed from the channel prior to deactivation of the site or forecast of rain. 7. During the wet season (generally October 1 through April 30), no stockpiled soils or other materials will remain exposed, unless surrounded by properly installed and maintained (i.e., per manufacturer specifications) silt fencing or other means of erosion control that prevents runoff from the stockpile into waters of the state. During the dry season, exposed, dry stockpiles will be watered, enclosed, covered (BMP GEN-25). 8. All pipes, culverts, or similar structures stored at a site within sensitive species areas, for one or more overnight periods will be securely capped prior to storage or inspected before the pipe is subsequently moved. If any potential special-status species are observed within a pipe, a Valley Water biologist will be consulted on what steps should be taken to protect the species. If a Valley Water biologist is on-site, they may remove the special status species from the pipes and relocate to the nearest appropriate and unaffected habitat.

BMP Number	BMP Title	BMP Description
GEN-27	Sediment Transport	To prevent sediment-laden water from being released back into waterways during transport of spoils to disposal locations, truck beds will be lined with an impervious material (e.g., plastic), or the tailgate will be blocked with wattles, hay bales, or other appropriate filtration material. Excess water may be drained from the truck by slightly tilting the loads and allowing the water to drain out through the applied filter. However, this may only occur where the sediment is being loaded into the trucks within the active project area in the creek or within an identified vegetated area (swale) that is separated from the creek.
GEN-28	Stream Access	Valley Water personnel will use existing access ramps and roads to the extent feasible. If necessary to avoid large mature trees, native vegetation, or other significant habitat features, temporary access points will be constructed in a manner that minimizes impacts according to the following guidelines: 1. Temporary access points will be constructed as close to the work area as possible to minimize equipment transport. 2. In considering channel access routes, slopes of greater than 20 percent will be avoided, if possible. 3. Any temporary fill used for access will be removed upon completion of the project and pre-project topography will be restored to the extent possible. 4. When temporary access is removed, disturbed areas will be revegetated or filled with compacted soil, seeded, and/or stabilized with erosion control fabric immediately after construction to prevent future erosion. 5. Personnel will use the appropriate equipment for the job that minimizes impacts and disturbance to the stream bottom. Appropriately-tired vehicles, either tracked or wheeled, will be used depending on the site and maintenance activity.
GEN-29	On-Site Hazardous Materials Management	1. An inventory of all hazardous materials used (and/or expected to be used) at the worksite and the end products that are produced (and/or expected to be produced) after their use will be maintained by the worksite manager. 2. As appropriate, containers will be properly labeled as hazardous materials and hazardous waste in accordance with city, state, and federal regulations. Any hazardous waste will be properly recycled or disposed of off-site. 3. Hazardous materials and wastes will be stored in watertight containers and stored in appropriate secondary containment that is capable of containing 110% of the primary container(s). Generators and other equipment with the potential to leak or spill fuels and lubricants will be stored or operated with secondary containment. Rainwater in secondary containment that may have mixed with hazardous waste will be properly disposed of. 4. Hazardous materials and waste will be stored away from waterways to avoid a direct connection to the storm drainage system or surface water. 5. Hazardous materials and waste will be covered when not in use and at the end of every workday, during wet weather, or when rain is forecasted.

BMP Number	BMP Title	BMP Description
		6. Sanitation facilities (e.g., portable toilets) will be placed outside of the creek channel and floodplain. Direct connections with soil, the storm drainage system, and surface waters will be avoided. 7. Sanitation facilities will be regularly cleaned and/or replaced and inspected daily for leaks and spills.
GEN-30	Existing Hazardous Materials	If hazardous materials, such as oil, batteries, or paint cans, are encountered at the maintenance sites, Valley Water will carefully remove and dispose of these materials according to applicable regulatory requirements. Valley Water staff will wear proper protective gear and store the waste in appropriate hazardous waste containers until it can be disposed of at a hazardous waste facility.
GEN-31	Paving and Asphalt Work	1. Avoid paving and seal coating in wet weather or when rain is in the forecast, to prevent materials that have not cured from contacting stormwater runoff. 2. Cover storm drain inlets and manholes when applying seal coat, tack coat, slurry seal or fog seal; and when saw cutting asphalt or concrete. 3. Collect and recycle, or as appropriate, dispose of excess abrasive gravel or sand. Do not sweep this material into gutters. 4. Do not use water to wash down fresh asphalt concrete pavement. 5. Use filter fabric, catch basin inlet filters, or gravel bags to keep slurry out of the storm drain system. 6. Shovel, absorb, or vacuum saw-cut slurry and dispose of all waste as soon as work is complete in one location or at the end of the workday. 7. If sawcut slurry enters a catch basin, clean it up immediately.
GEN-32	Painting and Paint Removal	1. Never clean brushes or rinse paint containers into a street, gutter, storm drain, or stream. 2. For water-based paints, paint out brushes to the extent possible and rinse into a drain that goes to the sanitary sewer. Never pour paint down a storm drain. 3. For oil-based paints, paint out brushes to the extent possible and clean with thinner or solvent in a proper container. Filter and reuse thinners and solvents. Dispose of excess liquids as hazardous waste. 4. Paint chips and dust from non-hazardous dry stripping and sand blasting may be swept up or collected in plastic drop cloths and disposed of as trash. 5. Chemical paint stripping residue and chips and dust from marine paints or paints containing lead, mercury, or tributyltin must be disposed of as hazardous waste. Lead-based paint removal requires a state-certified contractor.

BMP Number	BMP Title	BMP Description
GEN-33	Spill Prevention and Response	Valley Water will prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels, storm drains, or on the ground following these measures: 1. Valley Water field personnel will be appropriately trained in spill prevention, hazardous material control, and cleanup of accidental spills. 2. Equipment and materials for cleanup of spills will be available on site and spills and leaks will be cleaned up immediately and disposed of according to applicable regulatory requirements. 3. Field personnel will ensure that hazardous materials are properly handled and natural resources are protected by all reasonable means. 4. Spill prevention kits will always be in close proximity when using hazardous materials (e.g., at crew trucks and other logical locations). All field personnel will be advised of these locations. 5. Valley Water staff or contractors will routinely inspect the work site to verify that spill prevention and response measures are properly implemented and maintained. 6. Surfaces where fluids have spilled will not be hosed down. Dry cleanup methods (absorbent materials, cat litter, and/or rags) will be used. 7. Spilled dry materials will be swept up immediately. The contractor will not try to wash them away with water or bury them. If water must be used, the contractor will collect the water and spilled fluids and dispose of them as hazardous waste. 8. Spills on dirt areas will be cleaned up by digging up and properly disposing of contaminated materials. 9. Small spills (less than 18 inches in diameter), including small quantities of oil, gasoline, paint, or other materials, should be controlled by the first responder (maintenance staff) and do not necessarily require an emergency response team. Medium spills (greater than 18 inches but less than 6 feet in diameter) are generally controlled by the first responder (maintenance staff), but police or fire department HAZMAT teams may be called based on conditions. If a hazardous materials spill occurs that cannot be contained or cleaned up with the onsite materials or the spill is significant (larger than 6 feet in diameter or is a "running" spill), the onsite Valley Water field personnel will be responsible for immediately initiating an emergency response sequence by notifying the proper authorities (i.e., Valley Water Emergency Response (ER) Team and public fire and hazmat agencies) of the release; taking appropriate defensive steps from a safe distance to secure the site to minimize damage to people, environment, and property; and deferring all other response activities to public emergency response agencies and/or the Valley Water ER Team or Valley Water ER Contractor. Depending on the nature of the release, the Valley Water ER Team's actions will include urgent (responding within two hours of notification) field response site reconnaissance, emergency sequence initiation, defensive containment, release control, incident command, or priority (non-two-hour) field response site reconnaissance and clean-up operations.

BMP Number	BMP Title	BMP Description
		All significant releases of hazardous materials, including oil, are required by law to be reported. If a "reportable[10]" spill of petroleum products occurs, Valley Water's SMP Program Manager will be notified, and the appropriate safety and cleanup crews will be contacted. A written description of the reportable release is required to be submitted to the appropriate Regional Water Quality Control Board and the California Department of Toxic Substances Control (DTSC). This submittal must contain a description of the release, including the type of material and an estimate of the amount spilled, the date of the release, an explanation of why the spill occurred, and a description of the steps taken to prevent and control future releases.
GEN-34	Existing Hazardous Sites	Upon selection of maintenance project locations, Valley Water will conduct a search for existing known contaminated sites as part of its annual preparation of the Notice of Proposed Work (NPW) on the State Water Resource Control Board's GeoTracker Web site (http://www.geotracker.waterboards.ca.gov). The Geotracker search will only be performed for Valley Water's ground-disturbing activities. For any proposed ground disturbing maintenance sites located within 1,500 feet of any "open" sites where contamination has not been remediated, Valley Water will contact the RWQCB case manager listed in the database. Valley Water will work with the case manager to ensure maintenance activities do not affect cleanup or monitoring activities or threaten the public or environment.
GEN-35	Fire Prevention	1. All earthmoving and portable equipment with internal combustion engines will be equipped with spark arrestors. 2. During the high fire danger period (April 1–December 1), work crews will: a. Have appropriate fire suppression equipment available at the work site. b. Keep flammable materials, including flammable vegetation slash, at least 10 feet away from any equipment that could produce a spark, fire, or flame. 3. Do not use portable tools powered by gasoline-fueled internal combustion engines within 25 feet of any flammable materials unless a round-point shovel or fire extinguisher is within immediate reach of the work crew (no more than 25 feet away from the work area).
GEN-36	Dust Management	Valley Water will implement the Bay Area Air District Basic Dust Control Measures. Current measures stipulated by the Bay Area Air District Guidelines include the following: 1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) will be watered two times per day. 2. All haul trucks transporting soil, sand, or other loose material off-site will be covered.

[10]A reportable spill is defined when: a film or sheen on, or discoloration of, the water surface or adjoining bank/shoreline is observed; or a sludge or emulsion is deposited beneath the surface of the water or adjoining banks/shorelines (40 Code of Federal Regulations 110); or when another violation of water quality standards is observed.

BMP Number	BMP Title	BMP Description
		3. All visible mud or dirt track-out onto adjacent public roads will be removed using wet-power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited. 4. All vehicle speeds on unpaved roads will be limited to 15 mph. 5. All roadways, driveways, and sidewalks to be paved will be completed as soon as possible. Building pads will be laid as soon as possible after grading, unless seeding or soil binders are used. 6. Idling times will be minimized either by shutting equipment off when not in use or by reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure, Title 13, Section 2485 of California Code of Regulations [CCR]). Clear signage will be provided for construction workers at all access points. 7. All construction equipment will be maintained and properly tuned in accordance with manufacturer's specifications. All equipment will be checked by a certified mechanic and determined to be in proper condition prior to operation. 8. Post a publicly visible sign with the telephone number and person to contact at Valley Water regarding dust complaints. This person will respond and take corrective action within 48 hours. The Air District's phone number will also be visible to ensure compliance with applicable regulations.
GEN-37	Vehicle and Equipment Maintenance	1. All vehicles and equipment will be kept clean. Excessive build-up of oil and grease will be prevented. 2. All equipment used in the creek channel will be inspected for leaks each day prior to initiation of work. Maintenance, repairs, or other necessary actions will be taken to prevent or repair leaks prior to use. 3. Incoming vehicles and equipment (including delivery trucks and employee and subcontractor vehicles) will be checked for leaking oil and fluids. Vehicles or equipment visibly leaking operational fluids will not be allowed on-site. 4. No heavy equipment will operate in a live stream where feasible. For activities such as sediment removal where equipment must be operated from the stream, dewatering will be conducted as necessary, following the protocols in BMPs GEN-40 or GEN-41. 5. No equipment servicing will be done in the creek channel or immediate floodplain unless equipment stationed in these locations cannot be readily relocated (i.e., pumps and generators). 6. If emergency repairs are required in the field, only those repairs necessary to move equipment to a more secure location, which can be performed without releasing any material into the floodway or water, will be conducted in the channel or floodplain. 7. If necessary, all servicing of equipment done at the job site will be conducted in a designated, protected area to reduce threats to water quality from vehicle fluid spills. The designated area will be clearly marked with berms, sandbags, or other barriers. Secondary containment, such as a drain pan, to catch spills or leaks will be used when removing or changing fluids. Fluids will be stored in appropriate containers with covers and properly recycled or disposed of offsite.

BMP Number	BMP Title	BMP Description
GEN-38	Vehicle Cleaning	1. Equipment will be cleaned of any visible sediment or vegetation clumps before transferring and using in a different watershed to avoid spreading pathogens or exotic/invasive species. 2. Vehicle and equipment washing can occur on-site only as needed to prevent the spread of sediment, pathogens, or exotic/invasive species. No runoff from vehicle or equipment washing is allowed to enter creek channels or storm drains without being subjected to adequate filtration (e.g., vegetated buffers, straw wattles or bales, fiber rolls, and silt screens). The discharge of decant water from any on-site wash area to waterbodies or to areas outside of the active project site is prohibited. Additional vehicle/equipment washing will occur at the approved wash area in Valley Water's corporation yard.
GEN-39	Vehicle and Equipment Fueling	1. No fueling will be done in the channel (top-of-bank to top-of-bank) or immediate floodplain unless equipment stationed in these locations cannot be readily relocated (e.g., pumps and generators). 2. All off-site fueling sites (i.e., on access roads above the top-of-bank) will be equipped with secondary containment and avoid a direct connection to soil, surface water, or the storm drainage system. 3. A designated area will be designated for equipment fueling away from any slopes, watercourses, or drainage facilities. When possible, fueling will occur 100 feet away from any waterbody. 4. For stationary equipment that must be fueled on-site, secondary containment, such as a drain pan or drop cloth, will be used to prevent accidental spills of fuels from reaching the soil, surface water, or the storm drain system. Other impenetrable barriers may be used such as an earthen berm with a layer of Visqueen to prevent fluids from running off or through the staging area to waters of the U.S./state.
		Dewatering Measures
GEN-40	Diversion and/or Dewatering for Non-Tidal Sites	If water is present within the channel during the maintenance work period and work requires that equipment be used in the channel below the OHWM, the streamflow will be diverted around the work area by installing a temporary dam and/or bypass. Where appropriate, stream flow diversions will occur via gravity-driven systems. To avoid and minimize impacts to water quality and aquatic wildlife, the following measures will be implemented: 1. For construction and monitoring of a stream flow bypass, VW's *Sediment Removal and Bank Stabilization Projects* checklist will be completed. 2. Recommendations by a qualified biologist to protect native fisheries and aquatic vertebrates will be incorporated into the bypass design which may include: a. Screening the stream flow diversion source or pump;

BMP Number	BMP Title	BMP Description
		b. Relocation of native aquatic vertebrates, including targeted salvage of Pacific lamprey ammocetes following methods outlined in the Lamprey Technical Working Group (2020) Appendix C c. Where sediment removal activities occur, ensure that a berm is left between the work area and stream flows during excavation activities and that the berm between the work and the channel is wide enough to prevent introduction of turbid water from the cell into the channel; and d. Measures to ensure the diversion system will not result in negative effects to downstream flows (e.g. erosion) during or following diversion system implementation and dismantling. Construction: 1. The construction of diversion and dewatering facilities will be based on the water bypass plan. 2. Cofferdams will be installed both upstream and downstream of the work area to minimize impacts. 3. In streams where water may enter the maintenance site from downstream (reverse flow), additional cofferdams on the downstream end may be necessary. When multiple cofferdams are constructed, the upstream dam will be constructed first. 4. Instream cofferdams will only consist of sandbags[11], earthen fill, clean gravel, or rubber bladders. 5. Plastic sheeting will be placed over k-rails, timbers, and earthen fill to minimize water seepage into and out of the maintenance areas. The plastic sheets will be firmly anchored, using sandbags or gravel bags, to the streambed to minimize water seepage. 6. When pumping is necessary to dewater a work site, a temporary siltation basin and/or use of silt bags may be required to prevent sediment from re-entering the wetted channel. 7. If necessary to prevent erosion, an energy dissipator will be constructed at the discharge point. 8. Timing of flow diversions will be coordinated with the completion of the dam structure to avoid drying up the downstream creek area. 9. For diversion systems implemented on creek reaches supporting sensitive fish species: a. A qualified biologist must be on site during the construction and dismantling of a diversion system on a sensitive fish creek reach; and

[11] Clean gravel bags are preferred, but sandbags may be utilized if approved as part of the diversion and dewatering plan.

BMP Number	BMP Title	BMP Description
		b. Any proposed changes to the diversion plan must be approved by a qualified biologist before changes are implemented. Implementation: 1. Water flows downstream of the work site will be maintained to prevent stranding aquatic vertebrates, and implementation of channel dewatering in addition to relocation plans submitted to the appropriate agencies. a. Native aquatic vertebrates will be captured in the work area and transferred to another reach as determined by a qualified biologist. Timing of work in streams that support a significant number of amphibians will be delayed until metamorphosis occurs to minimize impacts to the resource. Capture and relocation of aquatic native vertebrates is not required at individual work sites when site conditions preclude reasonably effective operation of capture gear and equipment. b. Aquatic invertebrates will not be transferred (other than incidental catches) because of their anticipated abundance and colonization after completion of the repair work. 2. Water diverted around work sites and water detained by cofferdams will be protected from maintenance activity-related pollutants, such as soils, equipment lubricants, or fuels. 3. Filtration devices (silt bags attached to the ends of discharge hoses and pipes to remove sediment from discharged water) or settling basins will be provided as necessary at discharge sites to ensure that the turbidity of discharged water is not visibly more turbid than the water in the channel upstream of the maintenance site. If increases in turbidity are observed, additional measures will be implemented such as a larger settling basin or additional filtration. If increases in turbidity persist, Valley Water's SMP Implementation Project Manager will be alerted. 4. Water remaining in the work area will be removed by evaporation, seepage, or pumping. When pumping is required to dewater a site, the decanted water will be discharged with water bypassed around the site or in a separate erosion control – energy dissipation area/vegetated swale. The turbidity of discharged water will not be visibly more turbid than that of receiving water. Deconstruction: 1. When maintenance is completed, the flow diversion structure will be removed as soon as possible with a qualified biologist or biological monitor on site. Impounded water will be released at a reduced velocity to minimize erosion, turbidity, or harm to downstream habitat. 2. Removal of flow diversion will begin at the downstream end.

BMP Number	BMP Title	BMP Description
		3. When diversion structures are removed, the ponded water will be directed back into the low-flow channel in a phased manner to minimize erosion and downstream water quality impacts. Normal flows will be restored. 4. The area disturbed by flow bypass mechanisms will be restored to the pre-project condition at the completion of the project (to the extent practical). This may include, but is not limited to, recontouring the area and planting riparian vegetation.
GEN-41	Diversion and/or Dewatering in Tidal Work Areas	1. For tidal areas, a downstream cofferdam will be constructed to prevent the work area from being inundated by tidal flows. 2. Cofferdams and fish exclusion measures will be installed at low tide when the channel and project site are at their driest. 3. If possible, bypass pipes will not be used when work is being conducted on one side of the channel if flows can continue on the other side of the creek channel without entering the project area. 4. If downstream flows cannot be diverted around the work site, the creek waters will be transmitted around the site through cofferdam bypass pipes. Waters discharged through tidal cofferdam bypass pipes will not exceed 50 NTUs above the background levels of the tidal waters into which they are discharged. Energy dissipators may be installed at the discharge point to prevent erosion. 5. If upstream flows are present, the entire streamflow will be diverted around the work area. This may occur in work areas straddling non-tidal and tidal reaches. In muted tidal reaches (e.g., systems with a downstream tide gate), timing of flow diversions will be coordinated with the tide gate to maintain water within the downstream creek area and to minimize dry back conditions during low tide. 6. Cofferdams in tidal areas will consist of earthen or gravel material. If earthen material is used, the downstream and upstream faces will be covered by a protected covering (e.g., plastic or fabric) if needed to minimize erosion. A protective covering or sheeting will be placed on the water side of an earthen coffer dam to protect water quality. 7. When maintenance is complete, the cofferdams and bypass pipes will be removed as soon as possible, but no more than 72 hours after work is completed. Flows will be restored at a reduced velocity to minimize erosion, turbidity, or harm to downstream habitat. 8. A qualified biologist will be on site during the construction and dismantling of a dewatering system.
GEN-42	Pump/Generator Operations and Maintenance	When needed to assist in channel dewatering, pumps and generators will be maintained and operated in a manner that minimizes impacts to water quality and aquatic species:

BMP Number	BMP Title	BMP Description
		1. Pumps and generators will be maintained according to manufacturers' specifications to regulate flows to prevent dryback or washout conditions. 2. Generators will be stored or operated with secondary containment. 3. Pumps will be operated and monitored to prevent low water conditions, which could pump muddy bottom water, or high-water conditions, which create ponding. 4. All pump intakes will be screened to prevent entrainment of native fish or amphibian species. The screening dimensions will be appropriate to the species present. Pumps in steelhead creeks will be screened according to NMFS criteria (http://www.swr.noaa.gov/sr/fishscrn.pdf) to prevent entrainment of steelhead. 5. A qualified biologist will be on site during the construction and dismantling of a dewatering system.
Public Safety Measures		
GEN-43	Public Outreach	The public will be informed of upcoming maintenance work prior to the start of work as part of the NPW: 1. Neighborhood Work Notices will be distributed as part of the NPW preparation prior to the start of work. 2. Local governments (cities and County) will be notified of scheduled maintenance work. The NPW will be submitted to the public works departments~~,~~ and local fire districts~~, and Valley Water's Flood Protection and Watershed Advisory Committees.~~ 3. Valley Water will post specific information on individual maintenance projects on the SMP website: (https://www.valleywater.org/project-updates/stream-maintenance-program) 4. For high profile projects, at Valley Water's discretion, signs will be posted in the neighborhood to notify the public at least one week in advance of maintenance schedules, trail closures, and road/lane closures as necessary and as possible. Signage used at work sites will include contact information for lodging comments and/or complaints regarding the maintenance activities.
GEN-44	Implement Public Safety Measures	Valley Water will implement public safety measures during maintenance as follows: 1. Construction signs will be posted at job sites warning the public of construction work and to exercise caution, as appropriate, in public-access areas. 2. Where work is proposed adjacent to a recreational trail, warning signs will be posted several feet beyond the limits of work. Signs will also be posted if trails are temporarily closed. 3. If temporary lane closures are required to allow trucks to pull into and out of access points to the work site, advance signage will be posted. 4. Temporary fencing, either the orange safety type or chain link, will be installed above repair sites on bank stabilization projects.

BMP Number	BMP Title	BMP Description
		5. When necessary, Valley Water or contracted staff will provide traffic control and site security.
GEN-45	Minimize Noise Disturbances to Residential Areas	Valley Water will implement maintenance practices that minimize disturbances to residential areas surrounding work sites: 1. With the exception of emergencies, work will generally be conducted during normal working hours (6:30 a.m. to 4:00 p.m.) on weekdays. Vegetation maintenance activities that do not involve heavy equipment may begin at 6:00 a.m. Valley Water may adjust work hours to comply with local noise ordinances. Maintenance activities in residential areas will not occur on Saturdays, Sundays, or Valley Water observed holidays except during emergencies or with approval by the local jurisdiction and advance notification of surrounding residents. 2. Vehicles, generators, and heavy equipment will be equipped with adequate mufflers. 3. Idling of vehicles will be prohibited beyond 5 minutes unless operation of the engine is required to operate a necessary system, such as a power take-off.
GEN-46	Planning for Pedestrians, Traffic Flow, and Safety Measures	1. Work will be staged and conducted in a manner that maintains two-way traffic flow on public roadways in the vicinity of the work site. If temporary lane closures are necessary, they will be coordinated with the appropriate jurisdictional agency and scheduled to occur outside of peak traffic hours (7:00 a.m. – 10:00 a.m. and 3:00 p.m. – 6:00 p.m.) to the maximum extent practicable. Any lane closures will include advance warning signage, a detour route, and flaggers in both directions. When work is conducted on public roads and may have the potential to affect traffic flow, work will be coordinated with local emergency service providers as necessary to ensure that emergency vehicle access and response is not impeded. 2. Bicycle and pedestrian facilities closures will be scheduled outside of peak traffic hours (7:00 a.m.– 10:00 a.m. and 3:00 p.m. – 6:00 p.m.) to the maximum extent practicable. 3. Public transit access and routes will be maintained in the vicinity of the work site. If public transit will be affected by temporary road closures and require detours, affected transit authorities will be consulted and kept informed of project activities. 4. Adequate parking will be provided or designated public parking areas will be used for maintenance-related vehicles not in use during the maintenance period. 5. Access to driveways and private roads will be maintained. If brief periods of maintenance would temporarily block access, property owners would be notified prior to maintenance activities.
Cultural Resource Measures		
GEN-47	Minimize Impacts to Inadvertently Discovered Cultural Resources	Work in areas where cultural resources are identified will be restricted or stopped until proper protocols are met.

BMP Number	BMP Title	BMP Description
		1. Work at the location of the find will halt immediately within 100 feet of the find. A "no work" zone shall be established, utilizing appropriate flagging to delineate the boundary of this zone, which shall measure at least 100 feet in all directions from the find. 2. VW shall retain the services of an archaeologist, meeting the U.S. Secretary of the Interior's qualifications in archaeology (Federal Register Vol. 48, No. 190, 1983), who shall visit the discovery site as soon as practicable, and perform minor hand excavation to describe the archaeological resource present and assess the amount of disturbance. 3. The archaeologist shall provide to VW and, if projects are in USACE jurisdiction, the USACE, at a minimum, written and digital-photographic documentation of all observed cultural materials, utilizing the guidelines for evaluating archaeological resources for the California Register of Historical Resources (CRHR) and National Register of Historic Places (NRHP). Based on the assessment, VW and USACE shall identify the CEQA and Section 106 cultural resources compliance procedure to be implemented. 4. If the cultural resource appears to not meet the CRHR or NRHP criteria of significance or to be a unique archeological or tribal cultural resource and the USACE archaeologist concurs with the archaeologist's conclusions, construction shall continue while monitored by the archaeologist. The authorized maintenance work shall resume at the discovery site only after VW has retained an archaeologist to monitor and the Watershed Manager has received notification from the USACE to continue work. 5. If the find appears significant (i.e., appears to meet the CEQA definitions of an "historical resource" "unique archaeological resource", or "tribal cultural resource"), avoidance of additional impacts is the preferred alternative. The archaeologist shall determine if adverse impacts to the significant cultural resource can be avoided. 6. When avoidance is not feasible (e.g., maintenance activities cannot be deferred or they must be completed to satisfy the SMP objective), VW shall develop an Action Plan and submit it to the USACE within 48 hours of archaeologist's evaluation of the discovery. The Action Plan may be submitted via e-mail to the archaeologist. The Action Plan shall be prepared in accordance with current professional standards and State guidelines, including CEQA requirements for preparation of a data recovery plan if required, and shall describe the services of a Native American Consultant for sites containing Native American remains.
GEN-48	Discovery of Paleontological Resources	Work in areas where paleontological resources are identified will be restricted or stopped until proper protocols are met. 1. Work at the location of the find will halt immediately within 100 feet of the find. A "no work" zone shall be established utilizing appropriate flagging to delineate the boundary of this zone, which shall measure at least 100 feet in all directions from the find.

BMP Number	BMP Title	BMP Description
		2. VW shall retain the services of a Paleontologist, meeting the Society for Vertebrate Paleontology's criteria for a "qualified professional paleontologist" (Society of Vertebrate Paleontology Conformable Impact Mitigation Guidelines Committee 1995), who shall visit the discovery site as soon as practicable, and perform minor hand-excavation to describe the paleontological resource present and assess the amount of disturbance. 3. The paleontologist will follow the Society for Vertebrate Paleontology's guidelines for treatment of a paleontological find. Treatment may include preparation and recovery of fossil materials for an appropriate museum or university collection and may include preparation of a report describing the finds. VW will be responsible for ensuring that the paleontologist's recommendations are implemented.
GEN-49	Discovery of Human Remains	Work in areas where human remains are identified will be restricted or stopped until proper protocols are met. 1. Work at the location of the find will halt immediately within 100 feet of the find. A "no work" zone shall be established utilizing appropriate flagging to delineate the boundary of this zone, which shall measure at least 100 feet in all directions from the find. 2. In the event of discovery of human remains (or if the find consists of bones suspected to be human), the field crew supervisor shall take immediate steps to secure and protect such remains from vandalism during periods when work crews are absent. 3. VW shall immediately notify the Santa Clara County Coroner and provide any information that identifies the remains as Native American. If the remains are determined to be Native American, the Coroner shall contact the Native American Heritage Commission (NAHC) within 24 hours of being notified of the remains. The NAHC then designates and notifies, within 24 hours, a Most Likely Descendant (MLD). The MLD has 48 hours to respond and provide recommendations for the treatment or disposition, with proper dignity, of the human remains and grave goods. 4. Preservation in situ is the preferred option. Human remains shall be preserved in situ if continuation of the maintenance work, as determined by the archaeologist and MLD, will not cause further damage to the remains. The remains and artifacts shall be documented, the find location carefully backfilled (with protective geo-fabric if desirable) and recorded in VW project files. 5. Human remains or cultural items exposed during maintenance that cannot be protected from further damage shall be exhumed by the archaeologist at the discretion of the MLD and reburied with the concurrence of the MLD in a place mutually agreed upon by all parties.
GEN-50	Review of Projects with Native Soil	1. An archaeologist will conduct a review and analysis of those project sites that would involve disturbance/excavation of native soil previously undisturbed by contemporary human activities to determine their potential for affecting significant cultural resources. The analysis of the potential to disturb cultural resources will be based on an initial review of archival information from the California Historical Resources Information System/Northwest Information Center (CHRIS/NWIC). If necessary, the

BMP Number	BMP Title	BMP Description
		archaeologist will conduct additional research (including a review of the Sacred Lands Inventory of the Native American Heritage Commission) and a field inventory of the project site to determine the presence/absence of surface cultural materials associated with either pre-contact or historic-era occupation. The results, along with any mitigation and/or management recommendations, would be presented in an appropriate report and include Area of Potential Effects maps showing vertical and horizontal areas of disturbance, other necessary figures, and correspondence with interested parties. A summary table indicating appropriate management (e.g., monitoring during construction, presence/absence testing for subsurface resources, avoidance, data recovery, etc.) will be developed for each project site reviewed. The results report with be submitted to the USACE for Section 106 consultation. 2. If a cultural resource as determined by the archaeologist appears significant (i.e., appears to meet the CEQA definitions of an "historical resource" "unique archaeological resource", or "tribal cultural resource"), avoidance of additional impacts is the preferred alternative. If the resource cannot be avoided, the mitigation and/or management recommendations will be developed consistent with CEQA requirements, including requirements for a data recovery plan if required. 3. If the project location falls under the purview of a tribal monitoring agreement between Valley Water and a tribe, the archaeologist will determine whether the tribal monitoring agreement requires the presence of a tribal monitor at any of the project sites that would involve disturbance/excavation of native soil previously undisturbed by contemporary human activities. If the tribal monitoring agreement requires the presence of a tribal monitor, the archaeologist will arrange for one to be present during all ground disturbing activities.
Utilities Measures		
GEN-51	Investigation of Utility Line Locations	An evaluation of the locations of utility lines that could be affected by maintenance activities will be conducted annually as part of the preparation of the NPW. Utilities will be avoided as much as possible. For maintenance areas with the potential for adverse effects on utility services, the following measures will be implemented: 1. Utility excavation or encroachment permits will be required from the appropriate agencies. These permits include measures to minimize utility disruption. Valley Water and its contractors will comply with permit conditions. Such conditions will be included in construction contract specifications. 2. Utility locations will be verified through a field survey (potholing) and use of the Underground Service Alert services. 3. Detailed specifications will be prepared as part of the design plans to include procedures for the excavation, support, and/or fill of areas around utility cables and pipelines. All affected utility services will

BMP Number	BMP Title	BMP Description
		be notified of Valley Water's maintenance plans and schedule. Arrangements will be made with these entities regarding protection, relocation, or temporary disconnection of services. 4. Residents and businesses in the project area will be notified of planned utility service disruptions two to four days in advance, in accordance with state standards. 5. Disconnected cables and lines will be reconnected promptly.
Sediment Removal Measures		
SED-1	Groundwater Management	If high levels of groundwater (i.e., visible water) are encountered during excavations in a work area, the water will be pumped out of the work site or left within the work area if the work activity is not causing water quality degradation in a live stream. Water quality monitoring will also be required. Extracted water will be discharged into specifically constructed infiltration basins, holding ponds, or areas with vegetation to remove sediment prior to the water re-entering a creek to protect water quality. Water discharged into vegetated areas or swales will be pumped in a manner that will not create erosion around vegetation.
SED-2	Prevent Scour Downstream of Sediment Removal	Sediment removal sites located in the transport zone on alluvial fans may cause increased scour downstream if they experience scouring flows or rapid sediment accumulation after maintenance. After sediment removal in these areas, the channel will be graded so that the transition in the existing channel both upstream and downstream of the maintenance area is smooth and continuous between the maintained and non-maintained areas and does not present a sudden vertical transition (wall of sediment) or other blockage that could erode once flows are restored to the channel.
SED-3	Restore Channel Features	Low-flow channels within non-tidal streams will be contoured to facilitate fish passage and will emulate the pre-construction conditions as closely as possible within the finished channel topography.
SED-4	Berm Bypass	Where sediment removal is accomplished without a bypass by removing alternating cells, the berm between the work and the live channel will be wide enough to prevent introduction of turbid water from the cell into the live channel.
SED-5	Sediment Characterization	Projects involving sediment removal at channels, stream gauges, outfalls, culverts, flap gates, tide gates, grade control structures, bridges, fish ladders, and fish screens shall be characterized in accordance with Valley Water's Sediment Characterization Plans for the Program Renewal (Attachment E in SMP Manual). These projects shall be reported in the annual summary report. Sediment removed will not be reused without pre-approval from appropriate regulatory agencies. See Section 5.4 of the Manual for information on the waiver process.
Vegetation Management Measures		
VEG-1	Minimize Local Erosion Increase from In-channel Vegetation Removal	To minimize the potential effect of localized erosion, the toe of the bank will be protected by leaving vegetation to the maximum extent possible and consistent with the maintenance guidelines or original design requirements.

BMP Number	BMP Title	BMP Description
VEG-2	Non-native Invasive Plant Removal	Invasive species (e.g., cape ivy [*Delairea odorata/Senecio mikanoides]*, arundo [*Arundo donax*]) will be disposed of in a manner that will not contribute to the further spread of the species. Cape ivy removed during a project will be bagged and disposed of in a landfill. Arundo canes or invasive *Ludwigia* will be prevented from floating downstream or otherwise entering the creek or waterway.
VEG-3	Use Appropriate Equipment for Instream Removal	When using heavy equipment to cut or remove instream vegetation, low ground pressure equipment, such as tracked wheels, will be utilized to reduce impacts to the streambed. If use of such equipment requires dewatering, Valley Water will submit a dewatering plan as part of the NPW process.
VEG-4	Standard Grazing Procedures	1. Vegetation and areas to be preserved will be fenced off to exclude grazing animals. 2. Grazing animals will be excluded from stream channels, using fencing or other barriers. 3. Grazing animals will be excluded from areas where they may negatively impact sensitive biological resources as directed by the qualified biologists. 4. Grazing animals will be excluded from wetted channels, saturated soils, and wetlands. 5. Grazing will not occur within 24 hours of rain events or when soils are saturated or subject to compaction. 6. Animals will be provided access to off-stream water sources such as troughs or wells. 7. Grazing will be managed to maintain sufficient vegetative cover to prevent erosion. 8. Grazing will be implemented on a rotational basis across designated areas to allow for vegetation recovery and minimize soil compaction.
		Bank Stabilization Measures
BANK-1	Bank Stabilization Design to Prevent Erosion Downstream	To prevent potential downstream erosion impacts due to bank stabilization, the site design will be adjusted to provide proactive protection of vulnerable areas within the reach of the worksite. Such measures include, but are not limited to, appropriately keyed-in coir logs, riparian planting, strategic placement of rock, and flow deflectors. Bank stabilization will include appropriate transition designs that contour the repaired site to conform to adjacent areas upstream and downstream to prevent potential erosion impacts.
BANK-2	Concrete Use Near Waterways	Fresh concrete will be isolated until it no longer poses a threat to water quality, using the following appropriate measures: 1. Wet-sacked concrete and poured concrete will be excluded from the wetted channel for a period of 30 days after it is installed/poured. During that time, the concrete will be kept moist, and runoff from the concrete will not be allowed to enter a stream. Containment structures will be installed to control the placement of wet concrete and to prevent it from entering the channel outside of those structures.

BMP Number	BMP Title	BMP Description
		2. Commercial sealants (e.g., Deep Seal, Elasto-Deck Reservoir Grade) may be applied to the poured concrete surface where it may be difficult to exclude water flow for a long period of time. If a sealant is used, water will be excluded from the site until the sealant is dry. 3. Dry-sacked concrete will not be used in any channel. 4. An area outside of the channel and floodplain will be designated as a location for cleaning out concrete transit vehicles. 5. Temporary concrete washout facilities will be constructed and maintained in sufficient quantity and size to contain all liquid and concrete waste generated by washout operations. Concrete washouts may be contained in settling basins dug into the ground, raised and contained structures, trailers, etc. Concrete waste will be removed and disposed of appropriately. 6. Where slurries containing portland cement concrete or asphalt concrete are generated (such as from saw cutting, coring, or grinding), slurry wastes will not be allowed to enter storm drains or watercourses and will be removed and disposed of appropriately.
BANK-3	Bank Stabilization Post-Construction Maintenance	Valley Water may maintain or repair bank stabilization projects that are less than 2 years old and damaged by winter flows. Valley Water will notify the regulatory agencies 24 hours prior to beginning the work. The work will be reported as part of the Annual Summary Report submitted by January 31 of each year or, if necessary, the subsequent year. Appropriate BMPs will be applied during maintenance repairs.
Post Project Restoration Measures		
REVEG-1	Seeding	Sites where maintenance activities result in exposed soil will be stabilized to prevent erosion. Disturbed areas shall be seeded with native seed as soon as is appropriate after maintenance activities are complete. An erosion control seed mix may be applied to exposed soils and down to the ordinary high-water mark (OHWM). When necessary, seeding will occur in subsequent years to prevent erosion. 1. The seed mix should consist of California native grasses (e.g., *Hordeum brachyantherum*, *Elymus glaucus*, and *Vulpia microstachyes*) or annual, sterile seed mix. 2. Temporary earthen access roads may be seeded when site and horticultural conditions are suitable or have other appropriate erosion control measures in place (BMP GEN-25).
REVEG-2	Planting Material	Revegetation and replacement plantings will consist of locally collected materials. Selection of species to install in revegetation sites will reference natural areas on the same creek that have a similar ecological setting and/or as appropriate for the site location.
Management of Animal Conflict Measures		
ANI-1	Surface Barrier Applications to Prevent Burrowing	Surface barrier applications installed as a method of animal conflict management, (e.g. chain-link fencing, woven geotextiles, and other similar materials) will be installed in an area no longer than 300 feet and above OHWM. This area may include either inboard or outboard sides of the levee for 300 feet, with at least 300 feet

BMP Number	BMP Title	BMP Description
		of separation from another linear installation of physical barriers on the same slope, and barriers are only installed on one side of levee slopes. Surface barrier applications will be installed in an alternating pattern, such that no inboard and outboard levee faces will have erosion control blankets along the same levee stationing.
ANI-2	Prevent Harm to the Salt Marsh Harvest Mouse, California Ridgway's Rail, and California Black Rail	No harmful fumigants (e.g., chemicals that would have a risk of secondary effects on owls) will be used under the SMP. No fumigants will be used within the range of the salt marsh harvest mouse (SMHM), California's Ridgway's rail (CRR), or California Black Rail (CBR) as identified on SMP potential range maps. Methods of rodent control within suitable habitat for these species will be limited to live trapping. All live traps shall have openings measuring no smaller than 2 inches by 1 inch to allow any SMHM that inadvertently enters the trap to easily escape. All traps will be placed outside of pickleweed areas and above the high tide line.
ANI-3	Burrowing Owl Buffer Zone	In accordance with the California Department of Fish and Wildlife's (CDFW's) 2008 Guidance for Burrowing Owl Conservation, a 656-yard buffer will be established around known burrowing owl locations, within which no fumigants (including smoke bombs) will be used.
ANI-4	Animal Control in Sensitive Amphibian Habitat	No harmful fumigants (e.g., chemicals that would have a risk of secondary effects on amphibians) will be used under the SMP. Fumigants will not be used within the habitat areas of special-status amphibians. Any live traps will have openings measuring no smaller than 2 inches by 1 inch to allow California red-legged frogs, California tiger salamanders, or foothill yellow legged- frogs to safely exit.
ANI-5	Slurry Mixture near Waterways	All slurry-type mixes used to fill rodent burrows will be prevented from entering any waterway by using appropriate erosion control methods and will comply with the manufacturer's specifications. If the creek bed is dry or has been dewatered, any material that has entered the channel will be removed.
ANI-6	Species Requiring Depredation Permit	Animal Conflict Management will not include lethal control of species listed in California F&G Code Section 4181, including beaver and gray squirrel, without first obtaining a depredation permit.
Use of Pesticides		
HM-4	Posting and Notification for Pesticide Use	Posting of areas where pesticides are used will be performed in compliance with QEMS Document Q751D02 Control and Oversight of Pesticide Use as follows: 1. Posting will be performed in compliance with the label requirements of the product being applied. 2. Posting will be provided for any products applied in areas used by the public for recreational purposes or those areas readily accessible to the public, regardless of whether the label requires such notification. In doing this, Valley Water ensures that exposure risk is minimized further by adopting practices that go beyond the product label requirements. 3. Postings will notify staff and the general public of the date and time of application, the product's active ingredients and common name, and the time of allowable re-entry into the treated area. 4. Signs will not be removed until after the end of the specified re-entry interval.

BMP Number	BMP Title	BMP Description
		5. Right-to-know literature on the product will be made available to anyone in the area during the re-entry period. 6. A Valley Water staff contact phone number will be posted on the sign, including a cellular phone number. 7. Notification of pesticide activities will be made as required by law. Also, Valley Water will maintain records of neighbors with specific needs relative to notification before treatment of an adjacent area so that such needs are met.

Santa Clara Valley Water District
Stream Maintenance Program Renewal
Environmental Impact Report

Chapter 3
Environmental Setting and Impact Analysis

3.1 Introduction to the Environmental Setting and Impact Analysis

Sections 3.2 through 3.15 of this chapter describe the environmental resources and potential environmental impacts of the Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal). Each section describes the existing environmental setting and background information for a particular resource topic to help the reader understand the conditions that could be affected by the Program Renewal. In addition, each section in Chapter 3 includes a discussion of the criteria used to determine the significance levels of the Program Renewal's environmental impacts. If appropriate, mitigation measures are identified to reduce, where possible, the adverse effects of significant impacts.

Appendix C, *General Plan Policies and Ordinances,* provides general plan policies and regulations, and public agency ordinances from Santa Clara County and jurisdictions in the Program Renewal Area that may be applicable to the Program Renewal. There are 15 municipalities that may be directly affected by the maintenance activities that would occur under the Program Renewal. Valley Water will ensure that the Program Renewal aligns with the policies, regulations, and ordinances as they apply.

This environmental impact report (EIR) has been prepared as a Subsequent EIR (SEIR). Since certification of the SMP-2 Final SEIR in 2012, substantial changes have been proposed to the Stream Maintenance Program (SMP or Program), and new information of substantial importance has developed. The Program changes, changed circumstances, and new information have the potential to involve new or worsened significant environmental effects not evaluated in the 2012 SMP-2 SEIR. Under these circumstances, CEQA (Public Resources Code Section 21666) and the CEQA Guidelines (Public Resources Code Section 15162) require that an SEIR be prepared.

3.1.1 Regional Environmental Setting and Program Renewal Area

The regional setting for the Program Renewal Area includes the Santa Clara Valley, which extends the length of the Program Renewal Area and is surrounded by the Santa Cruz Mountains to the west, the Diablo Range to the east, and the San Francisco Bay to the north.

The Program Renewal Area includes 333 miles of creeks and channels within Santa Clara County below the 1,000-foot elevation contour in both the Santa Clara Valley basin and Pajaro River watershed (see Figure 2-1 in Chapter 2, *Project Description*). Maintenance activities are generally limited to locations where Valley Water has land rights or has maintenance obligations pursuant to effective licenses and agreements. Municipalities within the Program Renewal Area that contain Valley Water owned or maintained channels include the cities of

Campbell, Cupertino, Gilroy, Los Altos, Milpitas, Monte Sereno, Morgan Hill, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga, and Sunnyvale, and the towns of Los Altos Hills and Los Gatos. The Program Renewal Area is discussed further in Chapter 2, *Project Description* and shown in Figure 2-1.

3.1.2 Approach to Impact Analysis

When an SEIR is prepared, the environmental setting and baseline include the environmental impacts disclosed in the original EIR, and the SEIR discloses any additional impacts caused by project changes, changes in circumstances, or new information. Therefore, the project description for the Program Renewal describes activities under the 2012 SMP. In the resource sections listed below, these activities are considered as part of existing conditions, and the SEIR evaluates the incremental impact of the proposed changes to the SMP compared to existing conditions. These sections of the SEIR use the existing conditions at the time of the Notice of Preparation (NOP) as the environmental setting and baseline; the 2026-2037 impacts of the Program Renewal are then analyzed against this baseline. This approach to the SEIR baseline and impact analysis scope represents established Valley Water CEQA practice for subsequent review in the absence of unique circumstances and is consistent with CEQA case law, e.g., Fairview Neighbors v. County of Ventura (1999, 70 Cal. App. 4th 238). The resource sections that use this approach are Sections 3.3, "Air Quality"; 3.7, "Greenhouse Gas Emissions*";* and 3.12, "Transportation and Traffic."

Other resource sections in the SEIR use the existing conditions at the time of the publication of the 2022 Notice of Preparation as the environmental setting and baseline. These sections evaluate all maintenance activities of the SMP, including maintenance activities from the first and second iterations of the SMP that will continue to occur, and new activities that will be introduced in the third iteration of the SMP (Program Renewal). The baseline for evaluating the maintenance activities for the Program Renewal was established by searching publicly accessible databases, obtaining information from various published sources, field survey data, aerial images and maps, multiple versions of the *Stream Maintenance Program Manual,* and the CEQA environmental documents that have been prepared for the SMP. The resource sections that use this approach are Sections 3.2, "Aesthetics"; 3.4, "Biological Resources"; 3.5, "Cultural and Paleontological Resources"; 3.6, "Energy"; 3.8, "Hazards and Hazardous Materials"; 3.9, "Hydrology and Geomorphology"; 3.10, "Noise"; 3.11, "Public Services and Utilities"; 3.13, "Tribal Cultural Resources"; 3.14, "Water Quality"; and 3.15, "Wildfire."

Impact Terminology

This DSEIR uses the following terminology to describe the environmental effects of the Program.

- A finding of no *impact* is made when the analysis concludes that the Program would not affect the particular environmental resource or issue.
- An impact is considered *less than significant* if the analysis concludes that there would be no substantial adverse change in the environment and no mitigation is needed.
- An impact is considered *significant* if the analysis determines that a substantial adverse effect on the environment could occur. Depending on the nature of the impact and feasibility of mitigation which could be implemented, such impacts would result in one of the following two conclusions:

  - An impact is considered *less than significant with mitigation* if the analysis concludes that there would be no substantial adverse change in the environment with the inclusion of the mitigation measures described.
  - An impact is considered *significant and unavoidable* if the analysis concludes that there could be a substantial adverse effect on the environment and no feasible mitigation measures are available to reduce the impact to a less-than-significant level.

- *Mitigation* refers to specific measures or activities adopted to avoid, minimize, rectify, reduce, eliminate, or compensate for an impact.
- A *cumulative impact* can result when a change in the environment results from the incremental impact of a project when added to other related past, present, or reasonably foreseeable future projects. Significant cumulative impacts may result from individually minor but collectively substantial projects. The cumulative impact analysis in this DSEIR focuses on whether the Program's incremental contribution to significant cumulative impacts caused by past, present, or probable future projects is cumulatively considerable (i.e., significant).
- Because the term "significant" has a specific usage in evaluating impacts under CEQA, it is used only to describe the significance of impacts and is not used in other contexts within this document. Synonyms such as "substantial" have been used when not discussing the significance of an environmental impact.

3.1.3 Sections Eliminated from Further Analysis

The following resource topics have been eliminated from further analysis based on the nature and scope of the Program Renewal activities. A brief summary and description of these resource topics dismissed from further review is provided below.

Agriculture and Forestry Resources

The Program Renewal Area covers a large portion of Santa Clara County (see Figure 2-1), which contains a significant amount of land in agricultural uses. However, no activities under the Program Renewal would have an effect on these lands. Farmland and agricultural uses may be located near certain Program Renewal maintenance sites; however, all Program Renewal maintenance activities would take place within flood protection channels and streams maintained by Valley Water. These facilities do not contain lands designated or used for agriculture. In addition, these activities would be limited to maintenance and repair and would not result in more intensive land development. No Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, or lands under a Williamson Act contract would be converted under Program Renewal activities.

Similarly, the Valley Water flood protection channels that would be subjected to maintenance activities do not contain lands zoned or used for forest land or timberland. In addition, these activities would be limited to maintenance and repair and would not result in more intensive land development. No forest land or timberland would be converted under Program Renewal activities.

Geology and Soils

The Program Renewal would involve limited construction of permanent structures (e.g., culvert replacement), which could be subject to earthquake-related hazards, landslides, unstable soils, expansive soils, or other geotechnical hazards. However, Program Renewal activities would not exacerbate these hazards, and these facilities would be designed to meet appropriate professional standards and building codes to avoid such hazards; as a result, no significant impacts would result. The Program Renewal does include some activities that have a potential to lead to topsoil erosion; erosion and siltation are addressed in Section 3.14, "Water Quality." Furthermore, the Program Renewal would not involve the construction of any housing units requiring the use of septic tanks or other wastewater disposal systems.

Mineral Resources

Program Renewal activities would have no impact on the availability or use of a known, valuable or locally important mineral resource in Santa Clara County.

The Program Renewal Area includes a variety of streams and channels used for flood protection. No aggregate mining facilities are currently operating within facilities maintained by Valley Water. Although mines or mineral resource areas may be located near Program Renewal work sites, none of these activities could directly affect those mineral production sites.

Sediment excavated under the Program Renewal may be reused, with potential to offset demand for mineral resources such as aggregate. However, the total volume of dredged material created under the Program Renewal in any given year would be small (from 2014 through 2022 mean annual sediment removed was 40,281 cubic yards [Valley Water 2023]), and the amount available for reuse would be a fraction of this amount. This would not represent an appreciable fraction of the total aggregate resources used annually in the County.

Population and Housing

The Program Renewal does not involve the construction of permanent structures such as housing and employment centers, nor would it involve the creation of any new infrastructure. It only involves maintaining existing infrastructure. Thus, the Program Renewal would not induce growth either directly or indirectly. The Program Renewal would not displace substantial numbers of existing housing units or persons necessitating the construction of replacement housing elsewhere; no habitable structures exist within the stream reaches where maintenance would occur.

Land Use

Since the 2012 SEIR was certified, some general plans for cities within the SMP area have been updated. It is reasonable to assume that applicable general plan policies generally align with those summarized in Impact LU-3 of the 2012 SEIR, which provide for protection and maintenance of natural resources, protection of public health and safety, protection of regional water quality, providing flood protection practices in an environmentally sensitive manner, minimizing risk of injury and property damage caused by flooding, and more.

Based on review of the proposed changes in the Program Renewal work activities, no Program Renewal description changes would result in new or potentially more severe environmental impacts related to land use. The Program Renewal would not physically divide an established community, and Valley Water would avoid Program Renewal maintenance activity conflicts with applicable land use plans, policies and regulations discussed in Appendix C, *General Plan Policies and Ordinances*.

Recreation

No changes in the Program Renewal work activities have the potential to result in new or more severe impacts pertaining to recreational facilities. While some refinements would be made to the Program Renewal' project description, application of BMPs would help minimize temporary disruptions on recreational facilities including streamside trails. The Program Renewal would not increase the use of existing recreational facilities that would cause physical deterioration or call for new construction or expansion of recreational facilities.

3.2 Aesthetics

3.2.1 Introduction

This section presents the regulatory setting, environmental setting, and potential impacts of the Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal) as related to aesthetics.

Visual Character and Viewshed

Both natural and artificial landscape features make up the character of a view. The area of the landscape that is visible from a particular location (e.g., an overlook) or series of points (e.g., a road or trail) is defined as a viewshed. Visual character is influenced by geologic, hydrologic, botanical, wildlife, recreational, and urban features. Urban features include aspects of landscape settlement and development, such as roads, utilities, structures, earthworks, and the results of other human activities. The perception of visual character can vary significantly among viewers, depending on their level of sensitivity and interest. Among sensitive viewers, perception can vary seasonally and even hourly as weather, light, shadow, and the elements that compose the viewshed change. Form, line, color, and texture are the basic components used to describe visual character and quality for most visual assessments (U.S. Forest Service [USFS] 1974, Federal Highway Administration [FHWA] 2015). Under this system, the appearance of the viewshed is described in terms of the dominance of each of these components.

Visual Quality

Visual quality is evaluated in this section using the well-established approach to visual analysis adopted by the FHWA (Jones et al. 1975, FHWA 2015), employing the concepts of vividness, intactness, and unity, as defined below:

- Vividness is the visual power or memorability of landscape components as they combine in striking or distinctive visual patterns.
- Intactness is the visual integrity of the natural and human-built landscape and its freedom from encroaching elements; this factor can be present in well-kept urban and rural landscapes, as well as in natural settings.
- Unity is the visual coherence and compositional harmony of the landscape considered as a whole; it frequently attests to the careful design of individual components in the artificial landscape.

Visual quality is evaluated based on the relative degree of vividness, intactness, and unity, as modified by its visual sensitivity, discussed below. High-quality views are highly vivid, relatively intact, and exhibit a high degree of visual unity. Low-quality views lack vividness, are not visually intact, and possess a low degree of visual unity.

Visual Sensitivity and Viewer Response

The measure of the quality of a view must be tempered by the overall sensitivity of the viewer. Viewer sensitivity is based on the visibility of resources in the viewshed, the proximity of

viewers to the visual resource, the elevation of viewers relative to the visual resource, the frequency and duration of viewing, the number of viewers, and the type and expectations of individuals and viewer groups.

The criteria for identifying the importance of views are related in part to the position of the viewer relative to the resource. To identify the importance of views of a resource, a viewshed may be divided into distance zones of foreground, middle ground, and background. Generally, the closer a resource is to the viewer, the more dominant it is and the greater is its importance to the viewer. Although distance zones in viewsheds may vary between different geographic regions or types of terrain, a commonly used set of criteria identifies the foreground zone as 0.25–0.5 mile from the viewer, the middle ground zone as extending from the foreground zone to approximately 3–5 miles from the viewer, and the background zone as extending from the middle ground zone to infinity (USFS 1974).

Judgments of visual quality and viewer response must be made based in a regional frame of reference (U.S. Soil Conservation Service [USSCS] 1978). The same type of visual resource in different geographic areas could have a different degree of visual quality and sensitivity in each setting. For example, a small hill may be a significant visual element in a flat landscape but have very little significance in mountainous terrain.

Generally, visual sensitivity is higher for views seen by people who are driving for pleasure; people engaging in recreational activities such as hiking, biking, or camping; and homeowners. Sensitivity tends to be lower for views seen by people driving to and from work or as part of their work (USFS 1974, USSCS 1978, FHWA 2015). Commuters and non-recreational travelers have generally fleeting views and tend to focus on commute traffic, not on surrounding scenery; therefore, they are generally considered to have low visual sensitivity. Residential viewers typically have extended viewing periods and are concerned about changes in the views from their homes; therefore, they generally are considered to have moderate to high visual sensitivity. Viewers using recreation trails and areas, scenic highways, and scenic overlooks are usually assessed as having high visual sensitivity.

3.2.2 Regulatory Setting

The following subsections discuss federal and state laws and regulations that pertain to aesthetics for the Program Renewal. Applicable local plans, policies, regulations, or ordinances related to aesthetics are presented in **Appendix C**, *General Plan Policies and Ordinances*. In summary, Appendix C discusses several plans throughout the County and local jurisdictions that contain relevant strategies, policies, and goals for preserving scenic resources and enhancing aesthetic qualities of the natural and built environment through protecting natural scenery and minimizing potential visual effects of new projects.

Federal Plans, Policies, Regulations, and Laws

No federal plans, policies, regulations, or laws related to aesthetics are applicable to the Program Renewal.

State Plans, Policies, Regulations, and Laws

California Department of Transportation State Scenic Highway System

The California Scenic Highway Program was established in 1963, under Sections 260 through 263 of the Streets and Highways Code to preserve and enhance the natural beauty of California (California Department of Transportation [Caltrans] 2024). The Scenic Highway Program includes a list of highways that are either designated or eligible for designation as scenic highways (Caltrans 2024). For a State Scenic Highway-eligible roadway to be officially designated, the local jurisdiction in which it resides must adopt a scenic corridor protection program and apply to Caltrans for scenic highway approval, identifying and defining the scenic corridor of the highway. Once approved by Caltrans, the local jurisdiction receives notification that the highway has been designated a State Scenic Highway. The local jurisdiction must then adopt ordinances to preserve the scenic quality of the corridor or document the regulations that already exist in various portions of local codes, creating the scenic corridor protection program. A scenic corridor is defined as land that is visible from the highway right of way and comprised primarily of scenic and natural features. Scenic corridor boundaries are determined by topography, vegetation, viewing distance, and/or jurisdictional lines. Officially designated State Scenic Highways are marked with a California poppy, the logo for the California Scenic Highway Program.

The State Scenic Highways relevant to the Program Renewal are described in Section 3.2.3, "Environmental Setting."

3.2.3 Environmental Setting

Regional Visual Character

Santa Clara County's major topographic features include the Baylands, the Santa Clara Valley, the Diablo Range to the east, and the Santa Cruz Mountains to the west. The Baylands are in the northwestern part of the County, adjacent to the waters of the southern San Francisco Bay, and consist mostly of salt evaporation ponds and areas of salt marsh and wetlands. The Santa Clara Valley is oriented in a northwest-southeast direction and is surrounded by rolling hills. The entire eastern half of the county is encompassed by the Diablo Range, which is covered by grasslands, brush, and oak savannah. The lands of the Diablo Range typically have much less natural vegetative cover and far fewer stands of trees than the Santa Cruz Mountains (County of Santa Clara 2005). On the western side of the valley, the lower elevations of the Santa Cruz Mountains are characterized by rolling grasslands and oak-studded foothills. In the higher elevations of the Santa Cruz Mountains, the landscape transitions to mixed hardwoods and dense evergreen forests (County of Santa Clara 1994).

Urbanization in Santa Clara County has primarily occurred in the northern part of Santa Clara Valley. The majority of the county's residents (approximately 90 percent) and cities (13 out of 15) are located in the North Valley. The remaining two cities, Gilroy and Morgan Hill, are located in the South Valley. Unlike the North Valley, the South Valley is predominantly rural, with the exception of Gilroy, Morgan Hill, and the small unincorporated community of San Martin. Low-density residential developments predominate in both valley areas and the surrounding foothills (County of Santa Clara 1994).

Viewsheds

Views from the Santa Clara Valley floor are primarily of the foothills, ridges, and/or summits of the Santa Cruz Mountains and the Diablo Range. The topography and ridgelines within the County are highly variable. Along the eastern Diablo Range, prominent ridges run generally parallel to the Santa Clara Valley floor, from northwest to southeast. However, the Santa Cruz Mountains have a dominant ridge (the Summit Road area) that divides Santa Clara County from San Mateo and Santa Cruz Counties and intervening lower ridge areas. The lower ridge areas have other ridges or hillsides as their backdrop and can be oriented in many directions. This topography results in the Diablo Range being more visible from the valley than the Santa Cruz Mountains to the east (County of Santa Clara 2005).

Public open spaces in the Program Renewal Area with scenic vistas include Almaden Quicksilver, Calero, Coyote Lake–Harvey Bear Ranch, Ed Levin, Mt. Madonna, Santa Teresa and Upper Stevens Creek county parks, and numerous smaller regional and local parks (County of Santa Clara 2024a).

Scenic Highways and Corridors

One stretch of highway in the Program Renewal Area, a portion of the approximately 14-mile stretch of State Route (SR) 9 from the Santa Cruz County line to the Los Gatos city limits, has been officially designated by Caltrans as a State Scenic Highway (Caltrans 2024). In the Program Renewal Area, this State Scenic Highway follows upper Saratoga Creek and crosses Wildcat Creek within the West Valley Watershed (see Figure 2-3 in Chapter 2, *Project Description*).

Six stretches of highway, either completely or partially within Santa Clara County, have been identified as eligible for designation as State Scenic Highways: SR 9 from Monte Sereno to SR 17 near Los Gatos; SR 17 from SR 1 near Santa Cruz to SR 9 near Los Gatos; SR 35 from SR 17 to SR 92; SR 152 from SR 156 near San Felipe to Interstate 5; SR 156 from SR 1 near Castroville to SR 152 northeast of Hollister; and Interstate 280 from SR 17 to Interstate 80 near First Street in San Francisco.

Santa Clara County also has designated an extensive network of roadways as Scenic Highways. This network includes unincorporated areas of the county, offering a diversity of viewsheds to travelers. State Highways 9, 17, 35, 101, 152, 156, 280, and 680 and numerous local roads are identified as existing or proposed Scenic Highways (County of Santa Clara 1994, 2008).

In addition, some of the incorporated cities within Santa Clara County have identified scenic corridors and aesthetic resources. Overall, these are located around waterways and roadways that are identified by the County with views of the hillsides surrounding each city. Consistency of the Program Renewal with local policies to protect scenic corridors and aesthetic resources is discussed in Appendix C.

Where scenic highways and corridors intersect with Valley Water-maintained facilities, views from these highways and corridors could be affected by Program Renewal maintenance activities. In the Program Renewal Area, maintenance activities at tributary drainages to the Lexington Reservoir may be visible from SR 17 within the Guadalupe Watershed (see Figure 2-4 in Chapter 2, *Project Description*).

Recreational Trails

Access roads that parallel most Valley Water-maintained channels also provide creek side recreational (formal and informal) access. Some of these access roads are formalized as recreational trails, with signage and other amenities, such as benches. In other locations, access roads serve as informal creek side trails or pathways. Where accessible, these trails are used for a variety of recreational activities including walking, jogging, biking, dog-walking, and bird watching. Creek-side trails typically are composed of consolidated earth or gravel or are fully paved. These trails provide an important recreational resource, particularly in the urban environment and provide aesthetic value for recreational users. Where recreational trails intersect with Valley Water-maintained facilities, views from these trails could be affected by Program Renewal maintenance activities.

Aesthetic Quality at Program Renewal Facilities

The creeks in Santa Clara County drain runoff from the Santa Cruz Mountains and the Diablo Range to the valley floor and, eventually, to either Monterey Bay or San Francisco Bay. Many of these waterbodies flow through or near the County's urban areas, offering potential opportunities for views of creeks and stream channels depending on the surrounding bank vegetation, access to or along the channels, and other view-restricting factors. As described in Chapter 2, *Project Description*, channels within the Program Renewal Area are either considered modified, which generally consist of grass-lined or concrete-lined bed or bank or unmodified, which generally are earthen channels with small areas of modification (e.g., bridges, culverts, outfalls). The aesthetic quality of Valley Water-maintained facilities varies from reaches with limited vegetation to reaches supporting a full riparian canopy. Figures 2-7 through 2-8 in Chapter 2, *Project Description* show representative photos of channels within the Program Renewal Area. Many of the channel reaches that would be maintained under the Program Renewal are located along public roadways or trails. Public access adjacent to the Program Renewal channels may be provided by trails that would be located along the top of banks and at creek crossings.

Thus, some creeks maintained under the Program Renewal would be viewed by recreationalists, such as bicyclists, joggers, and horseback riders, as well as residents, people working in proximity to the creeks, other pedestrians, and motorists.

Valley Water has conducted maintenance activities under the Stream Maintenance Program (SMP) since 2002. Although the Program Renewal includes some updates to maintenance activities, the baseline for analysis of impacts is a stream system that has already been altered by maintenance activities on an ongoing basis.

Viewer Groups and Viewer Responses

Viewer groups in the vicinity of the Program Renewal Area and their sensitivity to visual changes in the area are described below. Viewer groups that have visual access to maintained facilities are divided into four categories: recreational users, residents, workers, and motorists.

Recreational Users

Recreational use in the Program Renewal Area includes a variety of activities, such as walking, jogging, biking, dog-walking, and bird watching. Many hiking trails within County

parks, such as Almaden Quicksilver, Sanborn-Skyline, Rancho San Antonio, Joseph D. Grant, Calero, Mt. Madonna, Coyote Lake–Harvey Bear Ranch, Ed Levin, and Anderson Lake, provide views of the Santa Clara Valley, the Bay, and/or the surrounding mountain ranges (County of Santa Clara 2024b). Viewer sensitivity for recreational users is considered moderately high because these users typically value the natural environment, appreciate the visual experience, and are sensitive to changes in views.

Residents

Residents are individuals whose homes are in proximity to Valley Water-maintained facilities in the Program Renewal Area. Similar to recreational users, viewer sensitivity among residents is moderately high because they are likely to highly value their local visual resources, appreciate the visual experience, and be sensitive to changes in views.

Workers

Workers are individuals whose place of employment is in proximity to Valley Water-maintained facilities in the Program Renewal Area, or who may come into contact with such facilities as part of their work activities (e.g., delivery persons). Viewer sensitivity is low to moderate among workers because they generally are not highly focused on the visual resources surrounding their workplace and are less sensitive to changes in views.

Motorists

Motorists use roadways at varying speeds; normal highway and roadway speeds differ based on the design speed of the roadway, traffic volumes, traveler's familiarity with the route, and roadway conditions (e.g., presence/absence of rain). Single views typically are of short duration, except on straighter stretches where views last slightly longer. Motorists who frequently travel the same routes generally possess low to moderate visual sensitivity to their surroundings. The passing landscape becomes familiar to these viewers, and their attention typically is not focused on passing views but on the roadway, roadway signs, and surrounding traffic. Motorists who travel local routes for sight-seeing purposes generally possess a higher visual sensitivity to their surroundings because they are likely to respond to the natural environment with higher regard and as a holistic visual experience.

Viewer sensitivity is expected to be moderately low for most motorists within the Program Renewal Area. The passing viewshed would be familiar and at standard roadway speeds, views would be of short duration. Thus, motorists would tend to be focused on the roadway and surrounding traffic.

3.2.4 Impact Analysis

Methodology

This section describes the methods used to determine whether the Program Renewal would result in significant impacts related to aesthetic resources. The significance criteria included in the section below were used to evaluate the Program Renewal's effects on aesthetic resources. The existing baseline conditions used in this analysis were the existing conditions at the time of the 2022 NOP publication. The visual analysis is based on evaluation of County maps and Valley Water's ground-based photographs of the Program Renewal maintenance sites.

Visual effects were assessed based on the Program Renewal's potential to substantially damage scenic resources (e.g., scenic roads, trees, and rock outcroppings), degrade the visual character or quality of the site, or impact a scenic vista or viewshed compared to the baseline conditions. The degree of impact depends both on the magnitude of change in the visual resource (i.e., visual character and quality) and on viewers' responses to and concern for those changes.

The evaluation of temporary or short-term visual impacts considers whether activities could substantially degrade the existing visual character or quality of the site or surrounding area, as well as the duration over which any such changes would occur. Because of their short-term nature, maintenance activities are typically considered to have less-than-significant effect on visual quality.

Actions with long-term visual effects, such as constructing new or altered structures, removing trees, and introducing new sources of nighttime light and daytime glare, can permanently alter the landscape in a manner that could affect existing scenic resources and the visual character or quality of the area, depending on the perspective of the viewer. In determining impact potential, the assessment considers the visual sensitivity of the Program Renewal Area. However, new structures and new sources of light are not proposed as part of the Program Renewal.

Criteria for Determining Significance

Based on Appendix G of the CEQA Guidelines, it was determined that the Program Renewal would result in a significant impact on aesthetics if it would:

A. have a substantial adverse effect on a scenic vista;

B. substantially damage publicly visible scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings viewed from a state or locally designated scenic highway;

C. substantially degrade the existing visual character or quality of public views of the site and its surroundings in non-urbanized and urbanized areas;

D. conflict with applicable zoning and other regulations governing scenic quality in urbanized areas; or

E. create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

Several Appendix G significance criteria were modified in this section to better fit the Program Renewal. Specifically, significance criterion (b) was modified to include locally designated scenic highways in addition to state designated scenic highways, and significance criterion (c) was modified to include an analysis of potential impacts to visual character and quality in urban areas due to a large portion of the Program Renewal Area being within urbanized portions of Santa Clara Valley.

Environmental Impacts

Impact AES-1: Substantial Adverse Effects on Scenic Vista (Less than Significant)

Views of scenic vistas from scenic vista viewpoints within the Program Renewal Area are generally located at relatively high elevations along ridgelines within public open space areas and are typically viewed by recreational hikers and bicyclists, and motorists. No proposed maintenance activities would be conducted above the 1,000-foot elevation contour where the majority of scenic vista viewpoints in Santa Clara County are located. Most Program Renewal activities would be conducted in urban areas, at lower elevations, mostly on the valley floor. In addition, Program Renewal maintenance activities including vegetation management (e.g., pruning, coppicing, mowing, grazing, herbicide application, and vegetation/tree removal), sediment removal from channels, bank stabilization, downed tree management, management of animal conflicts (e.g., levee compaction, filling in burrows, non-lethal trapping), and minor maintenance (e.g., fence repairs, graffiti removal, access road maintenance, trash and debris removal) would occur within channel corridors; therefore, it is unlikely that these activities would be highly visible from scenic vista viewpoints in the higher elevation areas of Santa Clara County.

Although temporary views of maintenance vehicles, machinery, and personnel may be available at varying degrees during implementation of Program Renewal activities, maintenance work at any given site would be relatively short in duration (lasting no longer than a few weeks in most cases). Additionally, once maintenance is completed, the visual conditions at Valley Water's facilities would not substantially change the degree that could cause an adverse effect on views of a scenic vista. Although vegetation management activities such as tree removal, pruning, coppicing, and downed tree management could somewhat alter the near-term character of the riparian corridor, it would not be highly noticeable when viewed from a scenic vista viewpoint. Bank stabilization projects would result in some sections of visibly altered banks with new materials; however, given the number of bank stabilization projects conducted each year (up to 1 mile), adverse effects on scenic vistas would be minimal. Moreover, the repair of a severely eroded bank is generally an improved aesthetic condition to most viewers compared to a damaged/threatened embankment. Sediment removal would visibly clear the channel of sediment; however, such changes would not be noticeable from a scenic vista viewpoint. Other Program Renewal activities such as management of animal conflicts and minor maintenance would be small in scale and would not be visible from scenic vista viewpoints.

Applicable Best Management Practices

The BMPs summarized below would be implemented to minimize impacts on views of a scenic vista. Full descriptions of each BMP are provided in Table 2-10 in Chapter 2, *Project Description*.

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of work areas, staging areas, and access routes are kept to the minimum area necessary to complete the maintenance work to minimize potential visual effects. As feasible, staging areas and access routes will be located within existing disturbed areas and along existing access roads.
- **BMP GEN-24: Work Site Housekeeping** will ensure that the work site is kept in a clean, neat, and orderly condition to minimize potential visual effects.

- **BMP REVEG-1: Seeding** will ensure that exposed soils are stabilized with native seed to prevent erosion and to minimize temporary visual effects associated with disturbed areas.
- **BMP REVEG-2: Planting Material** will ensure that revegetation and replacement plantings consist of locally collected materials. Selection of species to install in revegetation sites will reference natural areas along the same creek so that the work site has a similar ecological and visual setting to its surroundings.

Conclusion

Given the relatively minor effect that the Program Renewal activities would have on views of scenic vistas and through the implementation of BMPs to minimize effects on scenic vistas, this impact would be **less than significant** and would not require mitigation.

Mitigation Measures: No mitigation is required.

Impact AES-2: Substantial Damage to Publicly Visible Scenic Resources, Including but not Limited to Trees, Rock Outcroppings, and Historic Buildings Viewed from a State or Locally Designated Scenic Highway (Less than Significant with Mitigation)

For purposes of this analysis scenic resources are defined as areas that contribute to the aesthetic value of a landscape and may include views, natural formations, and mature, healthy trees with aesthetic value. Thus, substantial damage to scenic resources would occur if Program Renewal activities resulted in degradation of high-quality views of natural landscapes or substantial tree removal that was publicly visible including from a State or locally designated scenic route.

As described above in Section 3.2.3, "Environmental Setting," one stretch of SR 9 within the Program Renewal Area is officially designated by Caltrans as a State Scenic Highway and portions of SR 9, SR 17, SR 35, SR 152, SR 156, and I 280 are eligible for listing as State Scenic Highways. Additionally, the County has designated a number of roads within the Program Renewal Area as scenic freeways, expressways, arterial, and rural routes (County of Santa Clara 2008). These scenic routes generally provide views of the hills surrounding Santa Clara County. Additionally in many locations, access roads that also serve as recreational trails parallel Valley Water-maintained channels. These recreational trails provide views of scenic resources, including trees, along Valley Water-maintained channels and facilities. The Program Renewal would not result in substantial damage to rock outcroppings or historic buildings; for more information on historic resources, refer to Section 3.5, "Cultural and Paleontological Resources."

Maintenance activities may occur in channels which intersect with or are adjacent to State scenic highways, locally designated scenic routes, or recreational trails. Thus, some maintenance activities in proximity to scenic highways, scenic routes, and recreational trails could temporarily disrupt views. However, such views of maintenance equipment and activities in these locations would be temporary as maintenance activities would be conducted infrequently at any given location.

Maintenance activities, including sediment removal, bank stabilization, management of animal conflicts, and minor maintenance would be short in duration and thus views of these activities would be temporary. Even in the case of repeat activities (e.g., rodent control), the

appearance of these maintenance activities and post-maintenance alterations would not leave a lasting impression on the overall view from the window of a car traveling at highway speeds. Additionally, because these activities would temporary and would help improve water quality, safety, and the aesthetic quality of the area, these activities would not significantly impact the views of passing recreationalists on creek-side trails.

Vegetation management activities such as pruning, coppicing, and vegetation removal would result in a change to the visual condition of the riparian area and could disrupt views along these scenic corridors and recreational trails. Although vegetation management activities would occur in multiple locations at any given time, the majority of these activities would be conducted infrequently at any particular location, allowing the vegetation to grow back once activities are completed. For downed trees, Valley Water would retain downed trees that qualify as large woody debris in salmonid creeks, where feasible to preserve the ecological function of wood within waterways. Downed trees would only be removed if they posed a flood or safety risk to infrastructure. As such and given that viewers along these scenic routes would be traveling at highway speeds, vegetation management activities would not substantially damage the overall scenic resources along these corridors. Additionally, vegetation management activities along these creek-side trails may improve the views experienced by recreationalists and ensure that overgrown vegetation is removed and thus, would not substantially damage scenic resources along these trails.

Tree removal would be required along some Valley Water-maintained channels. All tree removal would be evaluated carefully and would only be conducted under circumstances where the channel conveyance capacity is reduced, the structural integrity of a facility is compromised, growth is limited and damaging facilities, necessary visual inspection of infrastructure is prevented, or the tree poses a wildfire or public safety risk. Because hazard trees are either dead, dying, or unstable, they would not be considered a scenic resource, and their removal would generally involve a visual improvement at the site. Mature and healthy trees (i.e., non-hazard trees) may be considered valuable scenic resources. Non-hazard tree removal conducted under the Program Renewal would be limited to the removal of 400 live trees per year for trees 6-12 inches in diameter at breast height (dbh) and up to 20 live trees per year for trees greater than 12 inches dbh. Additionally, over the 10-year Program Renewal period, up to 2,000 live trees 6-12 inches dbh may be removed and up to 150 live trees over 12 inches dbh may be removed. Although mature, healthy trees may be removed under the Program Renewal, no more than 20 percent of the overstory canopy would be removed in any reach, and at least 50 percent of the understory canopy of native vegetation would be retained. However, the degradation of scenic resources (i.e., removal of mature, healthy trees) would be a significant impact.

Applicable Best Management Practices

The BMPs summarized below would be implemented to reduce the potential for maintenance activities from substantially degrading publicly visible scenic resources, including within state and locally designated scenic highways. Full descriptions of each BMP are provided in Table 2-10 in Chapter 2, *Project Description*.

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of work areas, staging areas, and access routes are kept to the minimum area necessary to complete the maintenance work to minimize potential visual effects. As

feasible, staging areas and access routes will be located within existing disturbed areas and along existing access roads.

- **BMP GEN-24: Work Site Housekeeping** will ensure that the work site is kept in a clean, neat, and orderly condition to minimize potential visual effects.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on existing habitat conditions due to staging and stockpiling materials, including erosion control measures during the wet season.
- **BMP REVEG-1: Seeding** will ensure that exposed soils are stabilized with native seed to prevent erosion and to minimize temporary visual effects associated with disturbed areas.
- **BMP REVEG-2: Planting Material** will ensure that revegetation and replacement plantings consist of locally collected materials. Selection of species to install in revegetation sites will reference natural areas along the same creek so that the work site has a similar ecological and visual setting to its surroundings.

Conclusion

Even with the implementation of the above-listed BMPs, there would still be significant impact on scenic resources associated with tree removal. Implementation of **Mitigation Measure BIO-12, Compensatory Mitigation for Impacts to Woody Riparian Vegetation,** in Section 3.4, "Biological Resources," would ensure that any temporary or permanent impacts associated with tree removals would be mitigated by one or more of the following approaches including replacing non-invasive trees greater than 6 inches dbh with native trees within the same watershed; developing reach characterization sheets that inform vegetation plantings to maintain ecological equilibrium; and enhancing ecosystem recovery following large wildfires. Although there would be a short-term visual impact associated with tree removal before the replacement trees mature, these effects would be temporary. Implementation of BMPs including BMPs REVEG-1 (Seeding) and REVEG-2 (Planting Material) would reseed exposed soils and include revegetation with planting material to minimize these temporary visual effects. In conclusion, implementation of **Mitigation Measure BIO-12** would substantially reduce the impact on publicly visible scenic resources (mature, healthy trees) resulting from the Program Renewal. The impact would be **less than significant with mitigation**.

Mitigation Measure: BIO-12 (Refer to Section 3.4, "Biological Resources")

Impact AES-3: Substantial Degradation of the Existing Visual Character or Quality of the Site and its Surroundings in Non-urbanized and Urbanized Areas (Less than Significant)

Program Renewal activities would occur in both non-urbanized and urbanized areas of the Program Renewal Area. Thus, the visual character and quality of facilities maintained under the Program Renewal varies widely from densely vegetated riparian corridors along channels to sparsely vegetated concrete-lined channels (see Figures 2-7 and 2-8 in Chapter 2, *Project Description*). Viewing opportunities of activities range from roadways, which parallel or cross the channels; adjacent residential and commercial structures in urbanized areas; and recreational trails along channels and in open space areas and park lands. Thus, degradation

of the visual character of maintenance sites could adversely affect sensitive user groups such as recreationists and residents.

During maintenance activities, the visual character at a given location may be somewhat degraded at the immediate time work is conducted due to the presence of maintenance equipment, materials, and vehicles. However, maintenance activities at any given site would be temporary, varying in duration from a couple of weeks to several months during the in-stream work season. Depending on the maintenance site, visual conditions could improve as a result of proposed maintenance activities.

Proposed maintenance activities would involve vegetation management (e.g., pruning, coppicing, mowing, grazing, herbicide application, and vegetation/tree removal), sediment removal from channels, bank stabilization, downed tree management, management of animal conflicts (e.g., levee compaction, filling in burrows, non-lethal trapping), and minor maintenance (e.g., fence repairs, graffiti removal, access road maintenance, trash and debris removal). The following paragraphs describe the Program Renewal's effects on the visual character and quality.

Vegetation Management

Vegetation management activities such as mowing, pruning, coppicing, grazing, herbicide application, mitigation site maintenance, nonnative invasive plant management, and vegetation/tree removal would result in a change to the existing visual condition of the site and could degrade the visual character if it were to remove major large stands of vegetation. Additionally, a temporary visual impact would occur from the presence of maintenance crews and equipment near channels. Although vegetation management activities would occur in multiple locations at any given time, the majority of these activities would be conducted infrequently at any particular location, allowing the vegetation to grow back once activities are completed.

In some areas, herbicide treatment would be conducted frequently to maintain the location in a permanently denuded state. Though limited, this type of treatment would alter the visual quality and character of the area over the long term. However, maintaining areas in this state could have a beneficial effect by promoting viewing consistency (as opposed to alternating views of cleared areas and regrowth stages) and minimizing views of overgrowth. Similarly, pruning, mowing, grazing, coppicing, vegetation removal, and invasive plant management activities would alter a densely vegetated area to a partially vegetated or bare area; however, these activities could have a beneficial effect by reducing views of overgrown vegetation until newly planted vegetation grows in. Further, revegetating areas with native species would improve the long-term aesthetic value of the riparian corridor.

Because the work locations of vegetation management activities vary year to year and because the Program Renewal has self-imposed limits, vegetation management activities would not substantially change the visual character of Valley Water sites and surroundings. Additionally, such vegetation management activities would not be any different than those currently conducted by Valley Water. Furthermore, maintaining vegetation along Valley Water channels and other facilities could have a beneficial effect by minimizing views of overgrowth.

Tree removal would be required along some Valley Water channels, which could degrade the existing visual character of the site and its surroundings if it were to remove large stands of trees or remove trees in areas where existing trees are sparse. All tree removal activities would be evaluated carefully and would only be conducted under circumstances where the channel conveyance capacity is reduced, the structural integrity of a facility is compromised, necessary visual inspection of infrastructure is prevented, or the tree poses a wildfire or public safety risk. Because hazard trees are either dead, dying, or unstable, their removal would generally involve an improvement of the visual condition at the site. However, the removal of mature and healthy trees (i.e., non-hazard trees) could result in a substantial impact to the riparian corridor. As described above under Impact AES-2, the Program Renewal includes self-imposed limits that would limit the number of live trees that may be removed each year and over the 10-year Program Renewal period. Additionally, no more than 20 percent of the overstory ~~tree~~ canopy would be removed in any reach, and at least 50 percent of the understory canopy of native vegetation would be retained. For these reasons, this visual change would generally be considered less than significant.

Sediment Removal and Bank Stabilization

Sediment removal and bank stabilization activities would result in exposed and unvegetated channels at the maintenance location. Sediment removal would visibly clear the channel of sediment, vegetation, or blockages which could result in a significant change compared to the existing condition; however, clearing sediment and blockages would allow the channel to function more naturally, resulting in an aesthetic benefit. Sediment removed from Valley Water-maintained channels would be disposed or reused in various ways, depending on the quality of the excavated material.

Although bank stabilization projects would result in some sections of visibly altered banks with new materials, they would be limited to up to one linear mile of channel annually and softscape and hardscape/hybrid repair methods would be limited to 500 linear feet and 300 linear feet per project, respectively. Each bank repair site would also be revegetated through hydroseeding on disturbed earth areas when work is completed and some repair approaches would incorporate vegetation as part of the design (e.g., live construction with boulder base, contour wattling, brush mattress, etc.) Refer to Attachment D of the SMP Manual (provided in **Appendix A** of this DSEIR) for a description of bank stabilization techniques, designs, and photographs. Although the visual character of the site would be somewhat degraded until the planted vegetation re-establishes, the repair of a severely eroded bank is generally an improved aesthetic condition to most viewers compared to a damaged/threatened embankment.

Viewer response to altered channels and riparian corridors after conducting bank stabilization and sediment removal activities may vary. Commuters on creek-side trails who pass the site on a daily basis may react to the changed conditions; similarly recreational users may also notice a change. However, such changed conditions would be temporary as vegetation would grow back over time and the eroded bank or clogged channel would be repaired. In addition, work would occur at isolated locations and work limits would be in place to limit the size of the repair so work would not occur along the entire channel reach.

Downed Tree Management

Downed trees include fallen trees, logs, or limbs in the channel. For any downed tree, Valley Water would assess if the downed tree or log poses a potential flood risk or is likely to damage

infrastructure. Downed trees may also provide valuable natural resource functions and therefore, aesthetic benefits along anadromous salmonid channels. Downed trees that meet certain size requirements and are within salmonid creeks may be considered large woody debris and are retained where feasible. Thus, downed trees or large woody debris would only be removed or repositioned if they are capturing or trapping additional debris, reducing the channel conveyance capacity, or pose a flood or infrastructure risk. Because downed trees would be retained where possible to provide ecological benefits and because work would occur at isolated locations, there would not be significant change in the visual character of the site and its surroundings. Furthermore, in locations where trash rafts or debris jams are found associated with downed trees, removing or modifying the downed tree would result in a visual benefit to the site by removing accumulated and embedded trash and debris from the channel.

Management of Animal Conflicts

Other than the temporary presence of maintenance personnel and vehicles, proposed animal conflict management activities would not involve actions that would result in a significant degradation of the visual character or quality of a site. Additionally, these activities would be isolated and small in scale. Over the long term, the management of animal conflicts may result in benefits to the visual character or quality of treated areas as the integrity of Valley Water facilities would be preserved and visual damage would be minimized by repairing damage caused by animal activity (i.e., burrowing).

Minor Maintenance

Minor maintenance activities such as minor sediment removal; trash and debris removal; fence and gate repair; grading, structure repair; maintenance of fish ladders, trash booms, tide gates, floodwalls, flood barriers, and stream gauges; work at maintenance yards; minor erosion repair, and maintenance of restoration sites would be small in scale and would have limited potential to adversely affect visual quality beyond the temporary presence of maintenance personnel and vehicles. Additionally, some minor maintenance activities, including trash and debris removal and fence maintenance would improve the cleanliness at maintenance sites and thus improve the visual quality and character of channels.

Applicable Best Management Practices

The BMPs summarized below would be implemented to prevent maintenance activities from substantially degrading the existing visual character or quality of the site and its surroundings. Full descriptions of each BMP are provided in Table 2-10 in Chapter 2, *Project Description*.

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of work areas, staging areas, and access routes are kept to the minimum area necessary to complete the maintenance work to minimize potential visual effects. As feasible, staging areas and access routes will be located within existing disturbed areas and along existing access roads.
- **BMP GEN-24: Work Site Housekeeping** will ensure that the work site is kept in a clean, neat, and orderly condition to minimize potential visual effects.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.

- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on existing habitat conditions due to staging and stockpiling materials, including erosion control measures during the wet season.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that channels will be graded so that they do not present a sudden vertical transition or other blockages that could erode when flows are restored and create significant visual changes in the channel.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within nontidal streams will be contoured and restored to pre-construction conditions following construction.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of bank will be protected by leaving vegetation to minimize potential erosion and reduce potential visual effects associated with vegetation removal.
- **BMP REVEG-1: Seeding** will ensure that exposed soils are stabilized with native seed to prevent erosion and to minimize temporary visual effects associated with disturbed areas.
- **BMP REVEG-2: Planting Material** will ensure that revegetation and replacement plantings consist of locally collected material. Selection of species to install in revegetation sites will reference natural areas along the same creek so that the work site has a similar ecological and visual setting to its surroundings.

Conclusion

By conducting Program Renewal activities (i.e., such as vegetation management, sediment removal, trash and debris removal, bank stabilization), Valley Water is improving the environmental condition at their facilities by reducing the risk of flooding, preventing or halting erosion, and enhancing habitat by removing invasive species. In many cases, proposed maintenance activities (particularly trash and debris removal and bank stabilization) would also improve visual conditions at each site. Therefore, the Program Renewal would not substantially degrade the existing visual character or quality of the site and its surroundings, BMPs to minimize effects on visual quality would be implemented, and impacts would be **less than significant** and would not require mitigation.

Mitigation Measures: No mitigation is required.

Impact AES-4: Conflict with Applicable Zoning and Other Regulations Governing Scenic Quality in Urbanized Areas (Less than Significant)

A majority of the Program Renewal activities would occur within urban areas of Santa Clara County, as described above. Because the Program Renewal focuses on maintaining existing public infrastructure to ensure facilities are operating properly, the Program Renewal would not substantially change the scenic quality of a maintenance site nor conflict with zoning or other regulations governing scenic quality. Program Renewal consistency with local policies and ordinances governing scenic quality in urbanized areas is discussed in Appendix C.

Applicable Best Management Practices

None applicable.

Conclusion

For the reasons described above, impacts associated with the Program Renewal conflicting with applicable zoning or other regulations governing scenic quality would be **less than significant**. No mitigation is required.

Mitigation Measures: No mitigation is required.

Impact AES-5: Substantial Alteration to Day or Nighttime Views resulting from Additional Light or Glare (No Impact)

Program Renewal maintenance activities would be conducted during daylight hours only. No nighttime lighting would be utilized for maintenance activities. The Program Renewal would not involve construction of new facilities or modifications to existing facilities that would result in new reflective surfaces or installation of lighting. Therefore, no impact related to new sources of light or glare would occur.

Applicable Best Management Practices

None applicable.

Conclusion

For the reasons described above, **no impact** related to new sources of light or glare would occur.

Mitigation Measures: No mitigation is required.

3.3 Air Quality

3.3.1 Introduction

This section presents the regulatory setting, environmental setting, and potential impacts of the Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal) related to air quality.

Specific to this section is the term "sensitive receptors," meaning those who are particularly susceptible to the adverse effects of air pollution. These include children, the elderly, and people with illnesses. Examples include schools, nursing homes, hospitals, and residential areas. Sensitive receptors adjacent to stream reaches in the Program Renewal Area are numerous, and include people in residential areas, schools, elder care facilities, and hospitals.

3.3.2 Regulatory Setting

The following subsections discuss federal and state laws and regulations that pertain to air quality for the Program Renewal. Applicable regional and local plans, policies, regulations, or ordinances related to air quality are presented below and also in **Appendix C**, *General Plan Policies and Ordinances.*

In summary, Appendix C discusses several plans throughout the County and local jurisdictions that contain policies aimed at energy conservation and increase in renewable energy sources as well as transitioning to electrical vehicles and equipment. Local policies aim to reduce emission of criteria air pollutants and toxic air contaminants and encourage specific measures to reduce vehicle miles traveled (VMT), emissions from construction activities, and health risks.

Federal Plans, Policies, Regulations, and Laws

Clean Air Act

The U.S. Environmental Protection Agency (USEPA) carries out the provisions of the Clean Air Act (CAA), which was originally passed in 1963 and amended several times. and most recently in 2022. USEPA implements programs under the CAA that focus on reducing ambient air pollutant concentrations, reducing emissions of toxic pollutants, and phasing out the production and use of chemicals that destroy stratospheric ozone. USEPA sets ambient air limits, the National Ambient Air Quality Standards (NAAQS) for six criteria pollutants: particulate matter, carbon monoxide, nitrogen oxides, sulfur oxides, ground-level ozone, and lead. The NAAQS are presented in **Table 3.3-1**. Primary standards are set for the protection of human health and secondary standards are set for environmental protection. Areas which meet the primary standards are considered in "attainment" while areas with air quality not meeting the primary standards are in "nonattainment."

Of the six criteria pollutants, particulate matter and ground-level ozone pose the most widespread threat to human health. Particle pollution poses the greatest threat to sensitive receptors including children, the elderly, and asthmatics, as it impairs lung function. Particle pollution includes very fine soot and dust. Sources of particulate matter include ground-disturbing activities (such as construction grading and excavation); motor vehicles; power

generation activities; industrial operations; burning of fuels (such as wood, oil, and coal); dust from unpaved roads; and crushing and grinding operations. Particle pollution can be carried by the wind and impair air quality far from its source. To reduce particle levels, USEPA regulates emissions from motor vehicles and point sources.

Table 3.3-1. State and Federal Ambient Air Quality Standards

Contaminant	Averaging Time	State Standards[1,3]	Primary Federal Standards[2,3,5]	Secondary Federal Standards[2,3,6]
Ozone	1-hour	0.09 ppm (180 µg/m^3)	-	-
	8-hour	0.070 ppm (137 µg/m^3, see note 4)	0.070 ppm (137 µg/m^3)	Same as primary standard
Respirable Particulate Matter (PM_{10})	24-hour	50 µg/m^3	150 µg/m^3	Same as primary standard
	Annual arithmetic mean	20 µg/m^3	-	-
Fine Particulate Matter ($PM_{2.5}$)	24-hour	-	35 µg/m^3	Same as primary standard
	Annual arithmetic mean	12 µg/m^3	9 µg/m^3 [12]	Same as primary standard
Carbon Monoxide	8-hour	9.0 ppm	9 ppm (10 mg/m^3)	None
	1-hour	20 ppm	35 ppm (40 mg/m^3)	None
Nitrogen dioxide	Annual arithmetic mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3) [8]	Same as primary standard
	1-hour	0.18 ppm (339 µg/m^3)	0.100 ppm (188 µg/m^3) [8]	
Sulfur dioxide	24-hour	0.04 ppm (105 µg/m^3)	0.14 ppm (365 µg/m^3)	-
	3-hour	-	-	0.5 ppm (1,300 µg/m^3) [9]
	1-hour	0.25 ppm (655 µg/m^3)	75 ppb (196 µg/m^3)[9]	-
Lead[10]	30-day average	1.5 µg/m^3	-	-
	Calendar quarter	-	1.5 µg/m^3	Same as primary standard
	Rolling 3-month average[11]	-	0.15 µg/m^3	Same as primary standard
Visibility reducing particles	8-hour	See note 7	-	-
Sulfates	24-hour	25 µg/m^3	-	-
Hydrogen Sulfide	1-hour	0.03 ppm (42 µg/m^3)	-	-
Vinyl Chloride[10]	24-hour	0.01 ppm (26 µg/m^3)	-	-

Notes: µg/m^3 = micrograms per cubic meter; PM2.5 = particulate matter less than 2.5 microns in diameter; PM10 = particulate matter less than 10 microns in diameter; ppm = parts per million by volume

1. California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, suspended particulate matter—PM10, PM2.5, and visibility reducing particles, are values that are not to be exceeded. All

others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest eight-hour concentration in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the USEPA for further clarification and current federal policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25 degrees Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent procedure which can be shown to the satisfaction of the California Air Resources Board (CARB) to give equivalent results at or near the level of the air quality standard may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Extinction coefficient of 0.23 per kilometer—visibility of 10 miles or more (0.07 per kilometer—visibility of 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent. Method: Beta Attenuation and Transmittance through Filter Tape.
8. To attain this standard, the 3-year average of the 98th percentile of the daily maximum 1-hour average at each monitor within an area must not exceed 0.100 ppm (effective January 22, 2010). Note that the USEPA standards are in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national standards to the California standards the units can be converted from ppb to ppm. In this case, the national standards of 53 ppb and 100 ppb are identical to 0.053 ppm and 0.100 ppm, respectively.
9. On June 2, 2010, USEPA established a new 1-hour sulfur dioxide (SO2) standard, effective August 23, 2010, which is based on the 3-year average of the annual 99th percentile of 1-hour daily maximum concentrations. USEPA also revoked both the existing 24-hour SO2 standard of 0.14 ppm and the annual primary SO2 standard of 0.030 ppm, effective August 23, 2010. Note that the new standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the new primary national standard to the California standard, the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
10. CARB has identified lead and vinyl chloride as “toxic air contaminants” with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
11. National lead standard, rolling 3-month average: final rule signed October 15, 2008.
12. On February 7, 2024, the USEPA strengthened the NAAQS for the annual PM2.5 to 9.0 micrograms pe cubic meter. New designations for this standard will be available within two years of issuing the revised NAAQS. It is anticipated that Santa Clara County would not meet the new standard.

Sources: CARB 2016, USEPA 2024

Ground-level ozone is the primary component of smog. Ozone is formed from the interaction of reactive organic gases (ROG) and nitrogen oxides (NOx). ROG is emitted by motor vehicles, industrial activities, and consumer products (such as paints, inks, and adhesives). NOx is formed during the burning of fossil fuels such as gasoline, diesel fuel, coal, and oil. Weather and topography influence the formation and location of ground-level ozone. Hot temperatures spur the reaction between reactive organic compounds and nitrogen oxides to form ozone. Ground-level ozone settles into valleys when winds are calm, and temperatures are warm. Sensitive receptors to ozone are the same as those listed for particulate matter, with the addition of forests and agricultural crops.

Federal Vehicle Emission Standards

In 1975, Congress enacted the Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to the act, the USEPA and National Highway Traffic Safety Administration (NHTSA) are responsible for establishing additional vehicle standards. The Corporate Average Fuel Economy (CAFE) program was established to determine vehicle manufacturer compliance with the government's fuel economy standards. Compliance with the CAFE standards is determined based on each manufacturer's average fuel economy for the portion of their vehicles produced for sale in the country. The USEPA calculates a CAFE value for each manufacturer based on the city and highway fuel economy test results and vehicle sales. Based on information generated under the CAFE program, the Department of Transportation (DOT) is authorized to assess penalties for noncompliance.

In June 2024, the NHTSA announced the final rule for model years 2027 through 2031. The final rule established standards that require an industry-wide fleet wide average of approximately 50.4 miles per gallon (mpg) in 2031 for all passenger cars and light trucks, and an industry fleet-wide average of roughly 2.851 gallons per 100 miles in 2035 for heavy-duty pickup trucks and vans. The CAFE standards will increase at a rate of 2 percent per year for passenger cars in years 2027 through 2031 and 2 percent per year for light trucks in model years 2029 through 2031. The final heavy duty pickup trucks and vans fuel efficiency standards increase at a rate of 10 percent per year in years 2030-2032 and 8 percent per year in years 2033-2035 (NHTSA 2024).

State Plans, Policies, Regulations, and Laws

California Air Resources Board

The California Air Resources Board (CARB) was established in 1967. CARB has set California Ambient Air Quality Standards (CAAQS), presented in Table 3.3-1, that are more stringent than the NAAQS for most contaminants. These include standards for additional contaminants not covered in the NAAQS, including visibility reducing particles, sulfates, hydrogen sulfide, and vinyl chloride. The California Clean Air Act was passed in 1988 and requires nonattainment areas to achieve and maintain the CAAQS by the earliest time practicable, and local air districts to develop attainment plans for state standards.

California Transportation-Related Standards and Regulations

The state has policies and legislation addressing air emissions associated with industrial sources, transportation, electricity generation, and energy consumption, as summarized

below. Treatment activities under the Program Renewal would involve fuel consumption and the use of on-road and off-road vehicles, which are subject to transportation-related standards and regulations.

The Clean Air Act allows California, among other states, to seek a waiver of preemption, which prohibits states from setting emission standards for new motor vehicles stricter than federal standards. EPA must grant a waiver before California's stricter standards may be enforced and has done so in the past. In 2025, Congress enacted Joint Resolutions 87, 88, and 89 (signed into law on June 12, 2025) to rescind California's waivers to set certain state motor vehicle standards stricter than federal standards. However, the legal status of these resolutions is uncertain due to a pending legal challenge by the State of California.

Zero Emission Vehicles Executive Orders

In March 2012, Governor Jerry Brown issued Executive Order (EO) B-16-12 establishing a goal of 1.5 million Zero-Emission Vehicles (ZEVs) on California roads by 2025. In addition to the ZEV goal, the EO stipulated the following: by 2015, all major cities in California must have adequate infrastructure and be "zero-emission vehicle ready"; by 2020, the state will have established adequate infrastructure to support 1 million ZEVs; by 2050, virtually all personal transportation in the state will be based on ZEVs; and greenhouse gas (GHG) emissions from the transportation sector will be reduced by 80 percent below 1990 levels in 2050.

On January 26, 2018, Governor Brown issued EO B-48-18 establishing a goal of 5 million ZEVs on California roads by 2030 and spurred the installation and construction of 250,000 plug-in electric vehicle chargers, including 10,000 direct-current fast chargers, and 200 hydrogen refueling stations by 2025.

In September 2020, Governor Gavin Newsom signed EO N-79-20, which sets the following state goals: 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035; 100 percent of medium- and heavy-duty vehicles in the state will be zero-emission by 2045 for all operations where feasible, and by 2035 for drayage trucks; and 100 percent of off-road vehicles and equipment will be zero emission by 2035 where feasible. This EO calls upon state agencies, including CARB, the California Energy Commission (CEC), the California Public Utilities Commission (CPUC), the Department of Finance, and others to develop and propose regulations and strategies to achieve these goals.

Pavley Alternative Fuel Standards (AB 1007)

Assembly Bill (AB) 1007 (Pavley, Chapter 371, Statutes of 2005) required the CEC to prepare a state plan to increase the use of alternative fuels in California (State Alternative Fuels Plan). The CEC prepared the State Alternative Fuels Plan in partnership with CARB and in consultation with other state, federal, and local agencies. The final State Alternative Fuels Plan, published in December 2007, attempts to achieve an 80 percent reduction in GHG emissions associated with personal modes of transportation, even as California's population increases.

Advanced Clean Fleets and Cars

The Advanced Clean Truck (ACT) regulation, which was approved in March 2021, establishes ZEV sales requirements for medium and heavy-duty vehicles. The Advanced Clean Cars

Program regulations rapidly scale down emissions of light-duty passenger cars, pickup trucks, and SUVs and require an increased number of ZEV vehicles to meet air quality and climate change emissions goals.

The Advanced Clean Fleets (ACF) regulation is part of CARB's overall approach to accelerate a large-scale transition to zero-emission medium- and heavy-duty vehicles. This regulation works in conjunction with the ACT regulation, which helps ensure that ZEVs are brought to market. The ACF regulation applies to fleets performing drayage operations; those owned by state, local, and federal government agencies; and high priority fleets. High priority fleets are entities that own, operate, or direct at least one vehicle in California; have either $50 million or more in gross annual revenues; or own, operate, or have common ownership or control of a total of 50 or more vehicles (excluding light-duty package delivery vehicles). The regulation affects medium- and heavy-duty on-road vehicles with a gross vehicle weight rating greater than 8,500 pounds, off-road yard tractors, and light-duty mail and package delivery vehicles.

Manufacturers may only sell zero-emission medium- and heavy-duty vehicles starting in 2036. State and local government fleets, including city, county, special district, and state agency fleets, are required to ensure 50 percent of vehicle purchases are zero-emission beginning in 2024 and 100 percent of vehicle purchases are zero-emission by 2027. Small government fleets (those with 10 or fewer vehicles) and those in designated counties must start their ZEV purchases beginning in 2027. State and local government fleets may purchase either ZEVs or near-ZEVs, or a combination of ZEVs and near-ZEVs, until 2035. Starting in 2035, only ZEVs will meet the requirements. High priority and federal fleets must comply with the Model Year Schedule or may elect to use the optional ZEV Milestones Option to phase-in ZEVs into their fleets. For those following the model year schedule, fleets must purchase only ZEVs beginning 2024 and, starting January 1, 2025, must remove internal combustion engine vehicles at the end of their useful life as specified in the regulation. For those following the ZEV milestone option, fleets may elect to meet ZEV targets as a percentage of the total fleet starting with vehicle types that are most suitable for electrification.

The In-Use Off-Road Diesel-Fueled Fleets Regulation requires the following: imposes limits on idling, requires a written idling policy and reporting of vehicles to CARB, restricts adding older equipment to fleets and requires phase-out of the oldest engines, requires the use of renewable diesel (R99 or R100), and requires contracting agencies to have valid certificates of reported compliance for all listed contractors and subcontractors for equipment subject to this regulation.

Small Off-road Engine Regulation

Small off-road engines (SORE) are spark-ignition engines rated at or below 19 kilowatts. Engines in this category are primarily used for lawn, garden, and other small off-road equipment. CARB adopted emissions standards for SORE in 1990 and is currently working on new emission standards for SORE equipment to achieve the goals of Executive Order N-79-20, which sets a goal to transition off-road vehicles and equipment operations to 100 percent zero-emission vehicles by 2035 where feasible.

Portable Equipment Registration Program

The Statewide Portable Equipment Registration Program (PERP) establishes a system to uniformly regulate portable engines and portable engine-driven equipment units. After being

registered in this program, engines and equipment units and their owners or operators may operate throughout the state without the need to obtain permits from individual air districts. Owners or operators of portable engines and certain types of equipment can voluntarily register their units under this program. Operation of registered portable engines may still be subject to certain district requirements for reporting and notification. Engines with less than 50 brake horsepower are exempt from this program.

Airborne Toxic Control Measures Regulations

Airborne Toxic Control Measures (ATCM) regulations may also be applicable to the Program Renewal, including the following:

- ATCM for Diesel Particulate Matter from Portable Engines Rated at 50 Horsepower and Greater
- ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling
- ATCM to Reduce Particulate Emissions from Diesel-Fueled Engines Standards for Non-vehicular Diesel Fuel
- ATCM for Stationary Compression Ignition Engines
- Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations Asbestos ATCM for Surfacing Applications

Regional and Local Plans, Policies, Regulations, and Ordinances

CARB has designated fifteen air basins in the state. Thirty-five local air quality management districts are responsible for attainment and permitting in each basin and subbasin area. Santa Clara County is located in the San Francisco Bay Area Air Basin (SFBAAB). The Bay Area Air District oversees planning and permitting in the nine-county Bay Area, including Santa Clara County. Certain elements of the Program Renewal may be subject to Bay Area Air District permitting rules and regulations. This includes the following:

- **Regulation 2, Rule 1, General Permit Requirements.** This rule includes criteria for issuance or denial of permits, exemptions, and appeals against decisions of the Air Pollution Control Officer and Bay Area Air District actions on applications.
- **Regulation 6, Rule1, General Requirements.** This rule limits the quantity of particulate matter in the atmosphere by controlling emission rates, concentration, visible emissions, and opacity.
- **Regulation 6 Rule 6: Prohibition of Trackout.** This rule limits the quantity of PM in the atmosphere through control of trackout of solid materials onto paved public roads outside the boundaries of large construction sites.
- **Regulation 7, Odorous Substances.** Regulation 7 places general limitations on odorous substances and specific emission limitations on certain odorous compounds. Bay Area Air District staff investigate and track all odor complaints it receives, make attempts to visit the site and identify the source of the objectionable odor, and assist the owner or facility in finding a way to reduce the odor.

- **Regulation 8, Rule 15 Emulsified and Liquid Asphalts.** This rule limits the reactive organic gases content of asphalt available for use during construction through regulating the sale and use of asphalt and limits the ROG content of asphalt.
- **Regulation 11, Rule 14 Asbestos-Containing Serpentine.** The purpose of this rule is to control emissions from asbestos from unpaved road surfaces and other surfacing operations. This rule limits the use of serpentine material with greater than 5 percent asbestos content for covering roads or paths. This regulation is in line with the CARB's ATCM.

Bay Area Air District 2017 Clean Air Plan/Bay Area Air District CEQA Guidelines

The Bay Area Air District (formerly the Bay Area Air Quality Management District or BAAQMD[1]) has developed the Spare the Air-Cool the Climate: A Blueprint for Clean Air and Climate Protection in the Bay Area Final 2017 Clean Air Plan (2017 Clean Air Plan), which details planned efforts to improve Bay Area air quality, including reducing PM and TAC emissions, and protect public health. In addition, the 2017 Clean Air Plan simultaneously updates the 2010 Clean Air Plan, which is the most recent ozone plan for the Bay Area, to comply with state air quality planning requirements and reduce ozone precursors (BAAQMD[2] 2017a). The 2017 Clean Air Plan contains a control strategy that includes 85 individual control measures to reduce emissions of criteria air pollutants and GHGs from the full range of emission sources. The measures include stationary (industrial) sources, transportation, energy, buildings, agriculture, natural and working lands, waste management, and water (BAAQMD 2017a).

The Bay Area Air District published its latest version of the California Environmental Quality Act (CEQA) Guidelines in April 2023, to aid assessment of air quality impacts. The guidelines address evaluation of air quality impacts and their significance, and development of mitigation measures for significant impacts. The guidelines focus on criteria air pollutant, toxic air contaminant, and odor emissions generated from projects.

Additional regional and local policies related to air quality are listed in Appendix C.

3.3.3 Environmental Setting

Climate and Topography

Climate and topography dictate the potential for air pollution to build up or concentrate in geographic areas. Wind speed, inversions, atmospheric stability, solar radiation, and terrain all influence air pollution potential. The actual air quality is a function of the air pollution potential and the existing emissions at any given time.

Wind speed affects air quality because faster winds carry pollutants away from the source. Low wind speeds allow more pollutants to be emitted into the air mass per unit of time, leading to a buildup of pollutant concentration. Similarly, inversions influence the mass of air available for dilution by vertically limiting the distance pollutants can travel. An inversion

[1] The Bay Area Air District was formerly named the Bay Area Air Quality Management District (BAAQMD); the rebranding occurred in 2025. The Bay Area Air District documents that were prepared prior to 2025 and referenced in this EIR will be cited as BAAQMD.

occurs when the typical atmospheric condition of "temperature decreases with elevation increases" is reversed, or "inversed." Inversions may result in a layer of warmer air resting over a layer of cooler air. The denser cooler air is trapped below the less dense warm air. In this inversion situation, pollutants emitted are trapped beneath the warmer air aloft within the cooler air lower to the ground. This situation, in combination with reduced circulation, reduces opportunities for mixing and dispersion, potentially leading to higher pollutant concentrations and poorer air quality. Inversions in the Bay Area may limit the pollutant mixing depth of the lower air mass to as little as 50-100 meters above the ground surface. In the Bay Area, inversions can occur in the winter under conditions of cold, clear nights, with damp ground and little wind. Inversions also happen under warmer weather conditions when the fog systems keep ground temperatures cooler than the air above them (BAAQMD 2017c).

Atmospheric stability also influences the ability of pollutants to move vertically. Stability is defined as the atmosphere's resistance to vertical motions (BAAQMD 2017c). The more stable the air, the slower the mixing of pollutants into the air mass. Stability is dependent on the temperature gradient with elevation. A stronger standard temperature gradient (with temperatures decreasing with elevation increases) increases atmospheric instability and mixing. Atmospheric stability can cause reduced pollutant mixing and, therefore, increased air pollution potential.

Solar radiation is necessary for formation of ozone in the atmosphere. Ultraviolet sunlight and warm temperatures catalyze the chemical reaction between reactive organic gases and nitrogen oxides that form ozone. The frequent hot, sunny days in the Bay Area in the summer months promote ozone air pollution, particularly in the inland valleys where temperatures are warmest. Insufficient ultraviolet light and warmth in the winter reduce the likelihood of forming ozone (BAAQMD 2017c).

Topography influences air pollution principally through wind and circulation patterns. The lee side of mountains may be sheltered from the predominant winds, reducing turbulence and downward transport. Elevated terrains can create temperature and density driven circulations, with up-valley wind flows during daytime heating and down-valley flows during nighttime cooling (BAAQMD 2017c). In the Bay Area, typical on-shore regional wind patterns from the west and northwest can be reversed by seasonal off-shore flows, generating northeasterly and easterly winds. Winter cyclonic storms may bring southerly winds.

San Francisco Bay Air Subbasins

The Bay Area Air District divides the SFBAAB into subbasins with distinct climate and topography. Two air subbasins occupy Santa Clara County—the Peninsula and the Santa Clara Valley subbasins. The peninsula region of the Bay Area extends from the area northwest of San José to the Golden Gate, with the Santa Cruz Mountains extending up the center of the peninsula and terminating in South San Francisco. Small coastal towns on the west side of the mountains experience a high incidence of cool, foggy weather in the summer resulting from coastal ocean upwelling and northwest winds. Larger cities in the southeastern area of the peninsula, on the east side of the mountain range, experience warmer temperatures and few foggy days because the marine layer is blocked by the mountains to the west. Annual average wind speeds range from 5 to 10 miles per hour throughout the peninsula. On the east side of the mountains, the winds generally blow in a westerly pattern, although the wind patterns are influenced by local topographic features. The blocking effect of the Santa Cruz Mountains

results in higher temperatures in the eastern areas, with summertime maximum temperatures at Redwood City, representing the eastern peninsula, in the low 80s. The average minimum temperature in Redwood City is 40 degrees Fahrenheit (°F) in the winter and 52–54˚F in the summer. Air pollution potential is highest along the southeastern portion of the peninsula because this area is most protected from the high winds and fog of the marine layer, the emission density is relatively high, and pollutant transport from upwind sites is possible (BAAQMD 2017c).

The Santa Clara Valley subregion is bounded by the Santa Cruz Mountains to the west, the Diablo Range to the east, the San Francisco Bay to the north, and the convergence of the Gabilan Range and the Diablo Range to the south. The terrain of the Santa Clara Valley greatly influences the wind patterns and results in a prevailing flow roughly parallel to the Valley's northwest-southeast axis, with a north-northwesterly sea breeze extending up the valley during the afternoon and early evening and a light south-southeasterly drainage flow occurring during the late evening and early morning. Speeds are greatest in the spring and summer. The strongest winds generally occur during summer afternoon and evenings, although strong winds typically only occur during winter storms. In the summer, temperatures are warm during the day, with mostly cool nights. Near the San José airport, mean maximum temperatures range from the high 70s to the low 80s in the summer, and from the high 50s to the low 60s during the winter. Mean minimum temperatures are in the low 40s during the winter and in the high 50s during the summer. Further inland areas to the south may have greater temperature extremes because the moderating effect of the Bay is not as strong. Santa Clara Valley has a high air pollution potential because of the valley's large population; the transport of photochemical precursors from surrounding counties to the valley area; and the concentration of pollutants that occurs in the valley from the bordering mountains, winter inversions, and low-inversion summer days (BAAQMD 2017c).

Air Pollutants

Several air pollutants of concern would be associated with Program Renewal activities. These air pollutants are discussed briefly below. Two main categories of air pollutants are included: criteria air pollutants and toxic air contaminants (TACs). Criteria air pollutants are air pollutants with national and/or state air quality standards that define allowable concentrations of these substances in the ambient (or background) air. TACs are air pollutants that may lead to serious illness or increased mortality, even when present in relatively low concentrations.

Ozone

Ozone (O_3) is a reactive gas that, in the troposphere (the lowest region of the atmosphere), is a product of the photochemical process involving the sun's energy. It is a secondary pollutant that is formed when nitrogen oxides and reactive organic gases react in the presence of sunlight. Ozone at the Earth's surface causes numerous adverse health effects and is a criteria pollutant. For ozone, the adverse health effects could be mortality, emergency room visits (respiratory), and hospital admissions (respiratory). It is a major component of smog. In the stratosphere, ozone exists naturally and shields the Earth from harmful incoming ultraviolet radiation. High concentrations of ground-level ozone can adversely affect the human respiratory system and aggravate cardiovascular disease and many respiratory ailments. Ozone also damages natural ecosystems such as forests and foothill natural communities, agricultural crops, and some human-made materials (e.g., rubber, paint, and plastics).

Nitrogen Oxides

Nitrogen oxides (NOx) are a family of gaseous nitrogen compounds that are precursors to the formation of ozone and particulate matter. The major component of NOx, nitrogen dioxide (NO_2), is a reddish-brown gas that is toxic at high concentrations. NOx results primarily from the combustion of fossil fuels under high temperature and pressure. On-road and off-road motor vehicles and fuel combustion (use of natural gas for heating, cooking, and industrial use) are the major sources of this air pollutant.

Reactive Organic Gases

Reactive organic gases (ROG) consist of hydrocarbon compounds that exist in the ambient air. ROG contributes to the formation of smog and/or may itself be toxic. ROG emissions are a primary precursor to the formation of ozone. Sources of ROG include consumer products, paints, trees that emit ROGs, and the combustion of fossil fuels.

Particulate Matter

Particulate matter (PM) is a complex mixture of extremely small particles and liquid droplets. PM is made up of various components, including acids, organic chemicals, metals, and soil or dust particles. The size of particles is directly linked to the potential for causing health problems. PM particles that are smaller than 10 micrometers in diameter, called PM_{10}, are of most concern because these particles pass through the throat and nose and enter the lungs. Once inhaled, these particles can affect the heart and lungs and cause serious health effects. PM_{10} particles are typically found near roadways and industrial operations that generate dust. PM_{10} particles are deposited in the thoracic region of the lungs. Fine particles, called $PM_{2.5}$, are particles less than 2.5 micrometers in diameter and are found in smoke and haze. $PM_{2.5}$ particles penetrate deeply into the thoracic and alveolar regions of the lungs. When inhaled, $PM_{2.5}$ and PM_{10} can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks and cause or aggravate bronchitis and other lung diseases. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper in the lungs and damage lung tissues. Health effects of $PM_{2.5}$ include mortality (all causes), hospital admissions (respiratory, asthma, cardiovascular), emergency room visits (asthma), and acute myocardial infraction (non-fatal).

Toxic Air Contaminants

Hundreds of different types of toxic air contaminants exist, with varying degrees of toxicity. Many TACs are confirmed or suspected carcinogens or are known or suspected to cause birth defects or neurological damage. For some chemicals, such as carcinogens, no thresholds exist below which exposure can be considered risk-free. Examples of TAC sources in the Program Renewal Area include fossil fuel combustion sources, industrial processes, and gas stations.

Sources of TACs include stationary sources, area-wide sources, and mobile sources. The USEPA maintains a list of 187 TACs, also known as hazardous air pollutants. These hazardous air pollutants are also included on CARB's list of TACs. According to the California Almanac of Emissions and Air Quality (CARB 2013), many researchers consider diesel particulate matter (DPM) to be a primary contributor to health risk from TACs because particles in diesel exhaust carry a mixture of many harmful organic compounds and metals, rather than being a

single substance as are other TACs. Unlike many TACs, outdoor DPM is not monitored by CARB because no routine measurement method has been identified. However, using the CARB emission inventory's PM_{10} database, ambient PM_{10} monitoring data, and results from several studies, CARB has made preliminary estimates of DPM concentrations throughout the state (California Office of Environmental Health Hazard Assessment [OEHHA] 2001).

Odors

Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, headache). The ability to detect odors varies considerably among the population, and overall is subjective. People may have different reactions to the same odor. An odor that is offensive to one person may be acceptable to another (e.g., roasting coffee). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. This is known as odor fatigue; a person can become desensitized to almost any odor, after which recognition occurs only with an alteration in the intensity.

Quality and intensity are two properties present in any odor. The quality of an odor indicates the nature of the smell experience. For instance, if a person describes an odor as flowery or sweet, then the person is describing the quality of the odor. Intensity refers to the strength of the odor. For example, a person may use the word "strong" to describe the intensity of an odor. Odor intensity depends on the concentration in the air. When an odor sample is progressively diluted, the odor concentration decreases. As this occurs, the odor intensity weakens, and eventually becomes so low that the detection or recognition of the odor is quite difficult. At some point during dilution, the concentration of the odor reaches a level that is no longer detectable.

Air Quality Attainment Status

Air quality is a function of the climate, topography, and emissions in any area or upwind of that area. **Table 3.3-2** presents the attainment status of the state and federal standards in the Bay Area. The SFBAAB, including Santa Clara County, is in attainment status or unclassified for carbon monoxide, nitrogen dioxide, sulfur dioxide, and lead pollutant standards. The SFBAAB, including the Program Renewal Area, is currently designated as a state and federal non-attainment area for ozone and $PM_{2.5}$, and a state nonattainment area for PM_{10}. In 2017, the Bay Area Air District completed its 2017 Clean Air Plan to outline the path towards attaining all state and federal air quality standards.

Table 3.3-2. Bay Area Attainment Status of the State and Federal Ambient Air Quality Standards

Contaminant	Averaging Time	State Standards Attainment Status[1]	Federal Standards Attainment Status[2]
Ozone	1-hour	N	See note 4
	8-hour	N[7]	N[3]
Respirable Particulate Matter (PM_{10})	24-hour	N	U
	Annual arithmetic mean	N[6]	
Fine Particulate Matter ($PM_{2.5}$)	24-hour		N[8,9]
	Annual arithmetic mean	N[6]	A

Contaminant	Averaging Time	State Standards Attainment Status[1]	Federal Standards Attainment Status[2]
Carbon Monoxide	8-hour	A	A[5]
	1-hour	A	A
Nitrogen Dioxide	Annual arithmetic mean		A
	1-hour	A	U
Sulfur Dioxide	24-hour	A	A
	1-hour	A	
Lead	30-day average	A	
	Calendar quarter		A
Visibility Reducing Particles	8-hour	U	
Sulfates	24-hour	A	
Hydrogen Sulfide	1-hour	U	
Vinyl Chloride	24-hour	Not available	

Notes: A = attainment; N = nonattainment; U = unclassified

1. California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, suspended particulate matter—PM10, and visibility reducing particles are values that are not to be exceeded. The standards for sulfates, Lake Tahoe carbon monoxide, lead, hydrogen sulfide, and vinyl chloride are not to be equaled or exceeded. If the standard is for a 1-hour, 8-hour, or 24-hour average (i.e., all standards except for lead and the PM10 annual standard), then some measurements may be excluded. In particular, measurements are excluded that CARB determines would occur less than once per year on the average. The Lake Tahoe CO standard is 6.0 ppm, a level one-half the national standard and two-thirds the state standard.
2. National standards shown are the "primary standards" designed to protect public health. National standards other than for ozone, particulates and those based on annual averages are not to be exceeded more than once a year. The 1-hour ozone standard is attained if, during the most recent 3-year period, the average number of days per year with maximum hourly concentrations above the standard is equal to or less than one. The 8-hour ozone standard is attained when the 3-year average of the 4th highest daily concentrations is 0.075 parts per million (ppm) (75 parts per billion [ppb]) or less. The 24-hour PM10 standard is attained when the 3-year average of the 99th percentile of monitored concentrations is less than 150 micrograms per cubic meter ($\mu g/m^3$). The 24-hour $PM_{2.5}$ standard for particulate matter less than 2.5 microns in diameter (PM2.5) is attained when the 3-year average of 98th percentiles is less than 35 $\mu g/m^3$. Except for the national particulate standards, annual standards are met if the annual average falls below the standard at every site. The national annual particulate standard for particulate matter less than 10 microns in diameter (PM_{10}) is met if the 3-year average falls below the standard at every site. The annual $PM_{2.5}$ standard is met if the 3-year average of annual averages spatially averaged across officially designed clusters of sites falls below the standard.
3. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm. An area will meet the standard if the fourth-highest maximum daily 8-hour ozone concentration per year, averaged over three years, is equal to or less than 0.070 ppm. USEPA made recommendations on attainment designations for California by October 1, 2016, and issued final designations on June 4, 2018, classifying the San Francisco Bay Area Air Basin (SFBAAB) as being in nonattainment (Federal Register Vol. 83, No. 107, pp. 25776 25848). Nonattainment areas will have until 2020 to 2037 to meet the health standard, with attainment dates varying based on ozone level in the area.
4. The national 1-hour ozone standard was revoked by USEPA on June 15, 2005.
5. In April 1998, the Bay Area was redesignated to attainment for the national 8-hour carbon monoxide standard.
6. In June 2002, CARB established new annual standards for $PM_{2.5}$ and PM_{10}.
7. The 8-hour California ozone standard was approved by CARB on April 28, 2005, and became effective May 17, 2006.
8. On January 9, 2013, USEPA issued a final rule, determining that SFBAAB had attained the 24-hour $PM_{2.5}$ national standard. This rule suspends key SIP requirements as long as monitoring data continue to show that SFBAAB attains the standard. Despite this USEPA action, SFBAAB will continue to be designated as “nonattainment” for the national 24-hour $PM_{2.5}$ standard until the Bay Area Air District submits a “redesignation request” and a “maintenance plan” to USEPA, and USEPA approves the proposed redesignation.
9. On February 7, 2024, the USEPA strengthened the NAAQS for the annual PM2.5 to 9.0 micrograms per cubic meter. New designations for this standard will be available within two years of issuing the revised NAAQS. It is anticipated that Alameda County would not meet the new standard.

Existing Air Quality Conditions

The USEPA, CARB, and local air districts operate an extensive air monitoring network to measure progress toward attainment of the NAAQS and CAAQS. **Table 3.3-3** shows the most recent three years of available data. The closest station with data for all six criteria pollutants is the San José station. The data indicate that there were some recent exceedances of the $PM_{2.5}$ and ozone standards.

Table 3.3-3. Air Monitoring Data for 2021-2023, San José (Jackson Street) Monitoring Station

Pollutant	State/Federal Standards	2021		2022		2023	
		No. Exceed[1]	Max Conc	No. Exceed[1]	Max Conc	No. Exceed[1]	Max Conc
PM_{10} 24-hour	50/150 µg/m^3	0/0	45.1 µg/m^3	0/0	44.5 µg/m^3	0/0	NA
$PM_{2.5}$ 24-hour	NA/35 µg/m^3	NA/1	38.1 µg/m^3	NA/2	36.2 µg/m^3	NA/1	49.0 µg/m^3
$PM_{2.5}$ Annual	12.0/9.0 ug/m^3	NA	8.9 µg/m^3	NA	10.1 µg/m^3	NA	8.2 µg/m^3
Ozone 8-hour	0.070 ppm	NA	0.084 ppm	NA	0.074ppm	0/0	0.068 ppm
Ozone 1-hour	0.09 ppm/NA	3/NA	0.098 ppm	0/NA	0.090ppm	0/NA	0.087 ppm
CO 1-hour	20/35 ppm	0/0	1.703 ppm	0/0	1.755 ppm	0/0	1.642 ppm
NO_2 1-hour	0.18/0.1 ppm	0/0	0.048 ppm	0/0	0.047ppm	0/0	0.059 ppm
SO_2 24-hour	0.04 ppm/NA	0/NA	0.001 ppm	0/NA	0.001 ppm	0/NA	0.002 ppm
SO_2 1-hour	NA/0.075 ppm	NA/0	0.002 ppm	NA/0	0.002 ppm	NA/0	0.036 ppm

Notes: CO = carbon monoxide; NO_2 = nitrogen dioxide; $PM_{2.5}$ = particulate matter of 2.5 micrometers or less; PM_{10} = particulate matter of 10 micrometers or less; SO_2 = sulfur dioxide; NA = not available; ppb = parts per billion; ppm = parts per million; µg/m^3 = micrograms per cubic meter; * = insufficient data available to determine the value.

1. Indicates the number of exceedance days recorded annually at this monitoring station for a particular constituent compared to that constituent's CAAQS and NAAQS, respectively. The first number is the state value and the second number is the federal value if they are different.

Current Stream Maintenance Program (SMP-2) Emissions

Valley Water provided information on equipment and vehicle size and activity for 2023. The emissions from this equipment were estimated using CalEEMod version 2022.1.1.29 (California Air Pollution Control Officers Association [CAPCOA] 2022). Information on pesticide use was also used to estimate ROG emissions from pesticides. **Table 3.3-4** shows the existing SMP-2 criteria air pollutant emissions. Further details on these emission calculations can be found in **Appendix D**, *Air Quality and GHG Emission Calculations*.

Table 3.3-4. Existing (2023) Annual Emissions (tons) of Criteria Air Pollutants

Emissions Source	ROG	NOx	PM_{10}	$PM_{2.5}$
Off-Road & On-Road	3.44	7.24	47.5	5.07
Pesticide Use	4.3	-	-	-
Total	*7.74*	*7.24*	*47.2*	*5.07*

Note: All measurements are in tons per year.
Source: Appendix D.

3.3.4 Impact Analysis

Methodology

The baseline that was used for the air quality analysis is the existing air quality emission levels generated by the current SMP-2 activities. To the extent that new areas have been added for the Program Renewal, as well as the addition of new types of treatments requiring new pieces of equipment, an incremental increase in air emissions would result to potentially new and existing sensitive receptors compared to the existing baseline condition.

Although existing SMP-2 and Program Renewal maintenance activities are, and would be, widespread, transitory, and short-term in nature (similar to construction activities) they serve and would continue to serve the purpose of maintaining existing features rather than constructing new features. Therefore, the Bay Area Air District's operational CEQA thresholds for projects are most appropriate for the Program Renewal.

Air emissions from the Program Renewal maintenance activities were estimated for three sources: offroad vehicles, on-road vehicles, and pesticide use. Off-road equipment and on-road vehicle emissions were estimated using CalEEMod version 2022.1.1.29 (CAPCOA 2022). Two different CalEEmod scenarios were ran which included the baseline SMP-2 activities with the mitigation required from SMP-2 and the Program Renewal activities which in some activities will increase in number of hours of activity. The incremental increase in emissions is based on the difference between the Program Renewal CalEEMod scenario and the SMP-2 CalEEMod scenario. Information on equipment size and activity for 2023 was provided by Valley Water. It was assumed in the EIR analysis for both the SMP-2 and Program Renewal scenarios and in Appendix D that equipment used currently and, in the future, will be Tier 4 final engines[3] for off-road equipment. Valley Water indicated that some of their equipment in

[3] Tier 4 final emissions standards are the final stage of EPA regulations for diesel engine emissions. The regulations aim to reduce harmful emissions like particulate matter and nitrogen oxides. The CalEEMod input listed the existing equipment as Tier 4 final emissions and unmitigated since this is the existing condition as indicated by the equipment information provided by Valley Water and currently used for SMP activities.

the past used liquefied petroleum gas (LPG). LPG was not incorporated into the analysis since the CalEEMod air emissions model does not include default emission factors for these pieces of equipment; instead, equipment using LPG was treated as being diesel equipment which results in a conservative estimate. For the Program Renewal, based on the change from existing miles treated for a 7-year period of time to the Program Renewal's miles treated for a 10-year time period, a factor of 1.29 was used to scale up the activity of the equipment and vehicles unless other activity information for the future was provided by Valley Water. Details of the equipment and usage are available in Appendix D.

Pesticide use was based on the projected amounts listed in Table 2-2 in Chapter 2, *Project Description,* and the percentage of ROG in each pesticide, as identified in the California Department of Pesticide Regulation's (CDPR's) Pesticide Volatile Organic Compound Emission Inventory (CDPR 2025). For a list of the type and quantity of pesticides used under the existing SMP, refer to Table 3.8-2 in Section 3.8, "Hazards and Hazardous Materials."

The existing SMP-2 emissions are subtracted from the anticipated Program Renewal emissions to provide the incremental change in emissions from baseline. The incremental change from the existing baseline conditions is used to make a comparison to the CEQA significance thresholds.

Criteria for Determining Significance

For the purposes of this analysis, the Program Renewal would result in a significant impact on air quality if it would:

A. Conflict with or obstruct implementation of applicable air quality plans;

B. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);

C. Expose sensitive receptors to substantial pollutant concentrations; or

D. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Table 3.3-5 provides the Bay Area Air District's recommended significance criteria for analysis of air quality impacts.

Emissions associated with the Program Renewal were estimated for the various SMP activities as a whole; for this reason, the impact discussion in this section relative to Significance Criteria A through D is not broken down by the individual categories of maintenance activities. The CO threshold was not evaluated as the traffic volumes are below the screening criteria cited in the Bay Area Air District's CEQA guidance, and the Program Renewal activities are not anticipated to result in an exceedance of the CO ambient air quality standards. Odor complaints are not relevant as Program Renewal activities do not produce long term odors and therefore are not expected to have a complaint history.

Table 3.3-5. Bay Area Air District CEQA Thresholds of Significance for Criteria Air Pollutants

Criteria Air Pollutants and Precursors (Regional)	Operational Emission Thresholds
Reactive Organic Gases (ROG)	Average daily: 54 lb/day Maximum annual: 10 tpy
Nitrogen Oxides (NOx)	Average daily: 54 lb/day Maximum annual: 10 tpy
Particulate Matter (PM_{10})	Average daily: 82 lb/day Maximum annual: 15 tpy
Particulate Matter ($PM_{2.5}$)	Average daily: 54 lb/day Maximum annual: 10 tpy
PM_{10}/$PM_{2.5}$ (fugitive dust)	None
Local Carbon Monoxide (CO)	9.0 ppm (8-hour average), 20.0 ppm (1-hour average)
Local Risks and Hazards	**Threshold**
Risk and Hazards for new sources and receptors (Individual Project)	Compliance with Qualified Community Risk Reduction Plan OR Increased cancer risk of >10.0 in a million Increased non-cancer risk of > 1.0 Hazard Index (Chronic or Acute) Ambient $PM_{2.5}$ increase: > 0.3 µg/m^3 annual average
Risk and Hazards for new sources and receptors (Cumulative Threshold)	Compliance with Qualified Community Risk Reduction Plan OR Cancer risk: >100 million (from all local sources) Non-cancer risk: > 10.0 Hazard Index (from all local sources, Chronic) Ambient $PM_{2.5}$: > 0.8 µg/m^3 annual average (from all local sources)
Accidental Release of Acutely Hazardous Air Pollutants	**Threshold**
Accidental Release of Acutely Hazardous Air Pollutants	Storage or use of acutely hazardous materials located near receptors or new receptors located near stored or used acutely hazardous materials considered significant
Odors	**Threshold**
Odors	Five confirmed complaints per year averaged over 3 years

Notes: CO = carbon monoxide; lb/day = pounds per day; NOx= nitrogen oxide; PM2.5 = particulate matter of 2.5 micrometers or less; PM10 = particulate matter of 10 micrometers or less; ppm = parts per million; ROG = reactive organic gases; tpy = tons per year

Source: BAAQMD 2023

Environmental Impacts

Impact AIR-1: Conflict with or Obstruct Implementation of Applicable Air Quality Plans (Less than Significant)

The Program Renewal is consistent with local general plan policies applicable to air quality which are outlined in Appendix C. Many of these local general plans aim to reduce emissions of criteria pollutant and toxics by using efficient vehicles and equipment as well as by managing fugitive dust emissions. Many of the general plans reference consistency with Bay Area Air District plans and policies for air quality.

The applicable air quality plan is the Bay Area Air District's 2017 Bay Area Clean Air Plan. Consistency with the 2017 Bay Area Clean Air Plan can be determined if the Program Renewal supports the goals of the plan, includes applicable control measures from the plan, and would not disrupt or hinder implementation of any control measures from the plan.

The goals of the 2017 Bay Area Clean Air Plan are to protect air quality and health at the regional and local scale and protect the climate. To meet these goals, the 2017 Bay Area Clean Air Plan recommends specific control measures and actions to reduce emissions and decrease concentrations of harmful air pollutants. To this end, the 2017 Bay Area Clean Air Plan includes 85 control measures aimed at reducing air pollutants in the air basin (BAAQMD 2017a). These control measures are grouped into various categories: stationary source sector, transportation sector, buildings sector, energy sector, agriculture sector, natural and working lands sector, waste sector, and water sector. Only those sectors relevant to the Program Renewal are discussed in this section.

The control measures identified in the 2017 Bay Area Clean Air Plan that are most applicable to the Program Renewal are associated with the energy and transportation sectors. The Program Renewal would comply with all applicable regulations to reduce energy consumption and reduce fossil fuel combustion. Transportation sector control measures that would be incorporated into the Program Renewal include using Tier 4 equipment and using efficient transportation alternatives such as continued expansion of Valley Water's existing alternative fueled vehicles. Currently, Valley Water's alternative fueled vehicles consist of 15 percent hybrid vehicles and 2 percent electric vehicles compared to the total vehicle fleet (Lewis, pers. comm., 2024). Therefore, the Program Renewal would include applicable control measures identified in the 2017 Bay Area Clean Air Plan and would support the primary goals of the 2017 Bay Area Clean Air Plan.

The Program Renewal is consistent with the local plans and policies discussed in Appendix C.

Since the Program Renewal is consistent with regional and local air quality plans and policies, this impact is less than significant.

Applicable Best Management Practices

None of the best management practices (BMPs) described in Chapter 2, *Project Description,* would affect Valley Water's ability to be consistent with local plans and policies.

Conclusion

Since the Program Renewal is consistent with regional and local air quality plans and policies, this impact is **less than significant**.

Mitigation Measures: No mitigation is required.

Impact AIR-2: Temporary Increase in ROG, NOx, PM_{10}, and $PM_{2.5}$ Emissions during Maintenance Activities (Less than Significant)

Conducting the Program Renewal maintenance activities would generate emissions of criteria air pollutants. In particular, soil disturbance would cause temporary emissions of particulate matter. Fuel combustion involved with operating heavy equipment and on-road

vehicles used to dispose debris also would release particulate matter and other contaminants associated with motor vehicle operation, including carbon monoxide and ozone precursors (ROG and NOx). CO emissions are not quantified because based on BAAQMD screening procedures, the program-generated traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour, or 24,000 vehicles per hour, where vertical and/or horizontal mixing is substantially limited. Finally, use of pesticides would result in emissions of ROG.

This analysis considers emissions from both existing SMP-2 activities (which are used as the existing conditions baseline) and additional emissions resulting from implementation of the Program Renewal. **Table 3.3-6** summarizes annual emissions estimates for the existing SMP-2 activities and the Program Renewal. Annual emissions in tons are equivalent to average daily emissions in pounds per day when divided by the number of days in a year and convert tons to pounds. For additional information on how emissions were estimated, refer to Appendix D.

Although daily vehicle activity is anticipated to change to include up to 55 more daily roundtrips than SMP-2, emissions from on-road vehicles are anticipated to decrease due to decreased emission factors as fleets turnover and are replaced with newer vehicles that are less polluting and/or are alternatively fueled. There is anticipated to be an increase in off-road equipment use and a slight increase in vegetation management activities. Annual emissions from the Program Renewal compared to the existing SMP would increase in correspondence to the increase in the number of miles estimated to be covered, which was assumed to be a factor of 1.29. This increase is offset by the decrease in emissions associated with fleet equipment turnover.

Table 3.3-6. Estimated Annual Emissions of Criteria Air Pollutants

Emissions Source	ROG – Existing/Proposed	NOx – Existing/Proposed	PM_{10} – Existing/Proposed	$PM_{2.5}$ – Existing/Proposed
Off-Road & On-Road	3.44/4.06	7.24/8.60	47.2/47.6	5.07/5.13
Pesticide Use	4.3/4.3	–/–	–/	–/
Total	*7.74/8.36*	*7.24/8.6*	*47.2/47.6*	*5.07/5.13*
Incremental Increase	0.62	1.36	0.04	0.06
Bay Area Air District Threshold	10	10	15	10

Notes: All measurements are in tons per year.
NOx = nitrogen oxides; PM2.5 = particulate matter less than 2.5 microns in diameter; PM10 = particulate matter less than 10 microns in diameter; ROG = reactive organic gases
Average daily emission thresholds are equivalent to the annual threshold in tons per year.
Source: Data compiled by Montrose Environmental in 2024; see Appendix D.

Table 3.3-6 shows that annual emissions of criteria air pollutants from SMP-3 would be below the Bay Area Air District operational significance thresholds when compared to existing emissions. Based on this information, average daily emissions would similarly be below Bay Area Air District operational significance thresholds. The continued use of Tier 4 final engines as well as inclusion of alternative fueled equipment will reduce these NOx emissions over time. The PM_{10} emissions are driven by fugitive dust emissions from driving on unpaved

roads and disturbances of dirt. Implementation of BMPs for fugitive dust will minimize impacts from PM_{10} emissions. Since emissions are below the Bay Area Air District significance thresholds, the impact is less than significant.

These criteria air pollutant emissions could lead to increased concentrations of pollutants in the atmosphere and could result in health effects due to the increased emissions. TAC emissions that could affect human health are evaluated separately in Impact AIR-3 below. The ambient concentration of criteria pollutants is a result of complex atmospheric chemistry. Photochemical grid-based models simulate the chemical interactions and three-dimensional dispersion patterns on a regional, statewide, and national scale. These models are complex and require significant expertise, knowledge, and resources as they build on other third-party models and processing tools that characterize meteorology, emissions, and other environmental conditions, such as land cover, radiative properties, and boundary conditions. Use of these models is typically beyond the resources available for air quality analysis prepared pursuant to CEQA, and even if such an analysis was to be completed consideration would need be given to ensure the results would be meaningful based on modeling and data limitations This information is not widely available and, where it is available, its use to predict localized ozone standards violations and health effects would be speculative.

NOx and ROG are precursors to ozone, and NOx, ROG, and sulfur oxides (SOx) are precursors to secondarily formed $PM_{2.5}$. Chemical and physical processes transform some of these precursors to the criteria pollutant concentrations in the atmosphere. Multiple variables determine whether emissions of air pollutants from the Program Renewal move and disperse in the atmosphere in a manner in which concentrations of criteria pollutants would become elevated and result in health impacts. A specific mass of precursor emissions does not equate to an equivalent concentration of the resultant ozone or secondary particulate matter in that area. The resulting health effects of ambient air concentrations are further based on a complex relationship of multiple variables and factors. The calculated health effects are dependent upon the concentrations of pollutants to which the receptors are exposed the number and type of exposure pathways for a receptor, and the intake parameters from a receptor, which vary based upon age and sensitivity (e.g., presence of pre-existing conditions). Health effects would be more likely for individuals with greater susceptibility to exposure, and the location of receptors relative to the Program Renewal impacts would affect where the receptors are exposed to Program Renewal-related pollutants.

Health effects of ozone and criteria air pollutants are discussed in Section 3.3.3, "Environmental Setting." The following is a summary of the health effects from ozone, $PM_{2.5}$ and PM_{10}. Meteorology and terrain play major roles in ozone formation, and conditions for maximum ozone generation occur on days with low wind speeds or stagnant air, warm temperature, and cloudless skies. Short-term exposure (lasting a few hours) to ozone at levels typically observed in the SFBAAB can result in health effects. When inhaled, $PM_{2.5}$ and PM_{10} can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks and cause or aggravate bronchitis and other lung diseases. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper in the lungs and damage lung tissues. Health effects of $PM_{2.5}$ include mortality (all causes), hospital admissions (respiratory, asthma, cardiovascular), emergency room visits (asthma), and acute myocardial infraction (non-fatal). For ozone, the endpoints are mortality, emergency room visits (respiratory), and hospital admissions (respiratory).

Applicable Best Management Practices

The BMPs summarized below would be implemented to control dust emissions, equipment exhaust emissions, and pesticide drift emissions during the Program Renewal maintenance activities. Full descriptions of each BMP are provided in Chapter 2, *Project Description,* Table 2-10.

- **BMP GEN-2**: **Instream Herbicide Application** will ensure that proper protocols are followed for the application of instream herbicide. Application of herbicides will not occur when wind speeds exceed 10 miles per hour, which will minimize the exposure of emissions from toxic air pollutants. Restrictions will also be applied on herbicide ingredients that are subject to the special-status species injunctions.

- **BMP GEN-4**: **Minimize the Area of Disturbance** will ensure that the footprint of work area, staging areas, and access routes are kept to the minimum area necessary to complete maintenance work to minimize the amount of fugitive dust and therefore reduce the amount of PM_{10} emissions.

- **BMP GEN-24: Work Site Housekeeping** will ensure that the work site is kept in a clean, neat, and orderly condition to minimize the amount of fugitive dust.

- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to keep spoils and chemicals in designated areas which will help to minimize fugitive dust and emissions from entering sensitive areas.

- **BMP GEN-36: Dust Management** will ensure that the Bay Area Air District's Basic Dust Control Measures are implemented.

- **BMP GEN-37: Vehicle and Equipment Maintenance** will ensure that vehicles and equipment are properly maintained so that criteria air pollutant emissions are reduced.

- **BMP GEN-42: Pump/Generator Operations and Maintenance** will ensure that pumps and generators will be sufficiently maintained and operated so that emissions are minimized. Generators will be stored and operated with secondary containment. Implementation of these measures will reduce the amount of exposure of exhaust emissions from the operation and maintenance of pumps and generators during channel dewatering.

- **BMP HM-4: Posting and Notification for Pesticide Use** will provide notice of where pesticides will be used to minimize the exposure of toxic air pollutants to sensitive receptors.

Conclusion

Emissions of criteria air pollutants from the Program Renewal would be below the Bay Area Air District significance thresholds. While not required as air quality mitigation, **Mitigation Measure GHG-2, GHG Emissions Management Practices for Off-road Equipment and Vehicles**, which establishes requirements for zero emission and hybrid equipment and

newer trucks, would further reduce criteria pollutant emissions from equipment and trucks. Therefore, the impact is **less than significant,** and no mitigation is required.

Mitigation Measures: No mitigation is required.

Impact AIR-3: Expose Sensitive Receptors to Substantial Pollutant Concentrations (Diesel PM and Pesticides) during Maintenance Activities (Less than Significant)

Exhaust emissions from on- and off-road vehicles and equipment (e.g., generators, excavators, dozers, rollers, cranes, loaders, and trucks) used for maintenance under the Program Renewal would generate diesel PM, which is a toxic air contaminant. Individual maintenance activities would last from one day to several weeks. These maintenance activities would be countywide, transitory, and intermittent; when they have ceased, associated diesel PM emissions will have ceased as well. CARB's ATCM measures that are applicable to the Program Renewal would reduce exposure to TACs.

Health risk assessments for diesel PM are typically based on 9-, 40-, and 70-year exposure periods since they have chronic long-term health impacts, including cancer. Because of the short-term and highly variable nature of diesel PM emissions associated with the Program Renewal, exposure to diesel exhaust, including for sensitive receptors, would be well below the exposure period of concern. For this reason, Bay Area Air District significance thresholds for TAC health risks are not used in this analysis.

The use of pesticides and herbicides during maintenance activities could release air toxics into the air. The highest risk is for those sensitive receptors located downwind of the pesticide application. Regulations for application of pesticides were developed to reduce the extent of exposure to air toxics during pesticide applications.

The exposure to pesticide use is greatest during application that may cause acute short term health effects such as respiratory problems, watery eyes, and irritated skin. Prolonged use of pesticides may result in chronic long-term health impacts, including cancer. Existing pesticide regulations minimize the chances of acute exposure and limit the amount of long-term pesticide use in the environment.

Applicable Best Management Practices

The BMPs summarized below would be implemented to help minimize SMP-3 diesel PM and pesticide emissions. Full descriptions of these BMPs are provided in Chapter 2, *Project Description,* **Table 2-10**.

- **BMP GEN-2: Instream Herbicide Application** will ensure that proper protocols are followed for the application of instream herbicide. Herbicides will not be applied directly into the water, and the application of herbicides will not occur when wind speeds exceed 10 miles per hour, which will minimize the exposure of diesel PM and toxic air contaminants from pesticide emissions. Restrictions will be applied on herbicide ingredients that are subject to the special-status species injunctions.

- **BMP GEN-37: Vehicle and Equipment Maintenance** will ensure that vehicles and equipment are properly maintained so that criteria air pollutant emissions are reduced.

- **BMP GEN-42: Pump/Generator Operations and Maintenance** will ensure that pumps and generators will be sufficiently maintained and operated so that emissions are minimized. Generators will be stored and operated with secondary containment. Implementation of these measures will reduce the amount of exposure of exhaust emissions from the operation and maintenance of pumps and generators during channel dewatering.

- **BMP HM-4: Posting and Notification for Pesticide Use** will provide notice of where pesticides will be used to minimize the exposure of air toxics during pesticide applications.

Conclusion

Based on the above analysis, exposure of persons to diesel PM and pesticides concentrations would not be substantial; implementation of BMPs would reduce diesel PM and pesticide exposure. While not required as air quality mitigation, Mitigation Measure GHG-2, which establishes requirements for zero emission and hybrid equipment and newer trucks, would further reduce TAC emissions from diesel particulate matter. Therefore, exposure of persons to DPM and pesticides generated by the Program Renewal would be **less than significant,** and no mitigation would be required.

Mitigation Measures: No mitigation is required.

Impact AIR-4: Creation of Objectionable Odors (Less than Significant)

Sediment removal is the only activity in the Program Renewal that has the potential to generate substantial objectionable odors.

Sediment Removal

Excavated sediment from stream channels may contain high levels of organic material. Natural decomposition of organic material depletes oxygen in the subsurface environment, leading to anaerobic conditions and the generation of hydrogen sulfide. Subsequently, hydrogen sulfide gas may then be released when sediment is excavated. The potential concentrations of hydrogen sulfide gas released from sediment removal activities would not be substantial enough to adversely affect human health; however, they could cause annoyance by creating an objectionable odor in the vicinity of a specific maintenance/ stockpile work site or reuse/disposal location. The intensity of odor from excavated sediment would depend on the amount and quality of sediment.

The Bay Area Air District indicates that odor impacts could result from siting a new odor source near existing sensitive receptors; however, Valley Water is not aware of instances under the existing SMP when excavated or stockpiled sediment has generated odors that have created an annoyance. Conditions are anticipated to be substantively similar for SMP-3 as they were for SMP-2. Any odors, should they occur, would be localized, short-term, and would not be anticipated to affect a substantial number of people.

Applicable Best Management Practices

None of the BMPs described in Chapter 2, *Project Description,* would address objectionable odors that might be created by the Program Renewal.

Conclusion

Based on the above analysis, the impact from creation of objectionable odors would be **less than significant,** and no mitigation is required.

Mitigation Measures: No mitigation is required.

3.4 Biological Resources

3.4.1 Introduction and Methods

This section describes the terrestrial and aquatic biological resources present in Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal) Area, applicable federal and state regulations, potential impacts of the Program Renewal on biological resources, and measures necessary to reduce project impacts on biological resources to less-than-significant levels under the California Environmental Quality Act (CEQA).

This chapter includes four sections: "Introduction and Methods," "Regulatory Setting," "Environmental Setting," and "Impact Analysis." The "Introduction and Methods" section describes methods used to identify biological resources in the Program Renewal Area, including reviews of available Valley Water data. Federal and state regulations that apply to biological resources in the Program Renewal Area are discussed under "Regulatory Setting." "Environmental Setting" provides details on the climate and soils in the Program Renewal Area, natural communities and land cover types and the plant and wildlife species that occur in each community, and invasive and nonnative species and pathogens. In addition, "Environmental Setting" describes special-status species of plants and animals and their potential to occur within the Program Renewal Area and maintenance activity work areas, sensitive natural communities in the Program Renewal Area, and wildlife movement. "Impact Analysis" evaluates whether the Program Renewal impacts on biological resources are significant under CEQA and identifies feasible mitigation measures to reduce impacts to a less-than-significant level, where necessary.

As an example of how this chapter is structured, for the federally threatened California red-legged frog (*Rana draytonii*), "Introduction and Methods" describes reports, literature, and technical databases, as well as Valley Water survey data, that were reviewed to determine the potential presence of this species in the Program Renewal Area. "Regulatory Setting" discusses the Federal Endangered Species Act (FESA), which protects this species. Under "Environmental Setting," natural communities and land cover types potentially supporting red-legged frogs, such as riparian forest and scrub and wetlands, are described, along with associated plant and animal species. Invasive species and pathogens that may have harmful effects on red-legged frogs and their habitats are also described. The potential for California red-legged frogs to occur in the Program Renewal Area and maintenance activity work areas, as well as their distribution, is discussed under "Special-Status Animals." Program Renewal impacts on this species, measures being implemented by the Program Renewal to reduce impacts, and mitigation measures to reduce impacts to less-than-significant levels are addressed under Impact BIO-1J.

To identify biological resources, a number of documents and resources were collected and reviewed, including the Santa Clara Valley Water District (Valley Water) 2027–2036 Stream Maintenance Program Manual (SMP Manual) (Valley Water 2024a); survey data provided by Valley Water (described in detail below); aerial images (Google LLC 2024); U.S. Geological Survey (USGS) topographic maps; the California Department of Fish and Wildlife's (CDFW's) California Natural Diversity Database (CNDDB 2024); the *2019–2023 Stream Maintenance Program Renewal Manual* (Valley Water 2014) and Final Environmental Impact Report (2011); the 2002 Stream Maintenance Program Renewal (Valley Water 2001) and *Final*

Environmental Impact Report for the Multi-Year Stream Maintenance Program Renewal (Valley Water 2002a); the Santa Clara Valley Water District Hazard Tree Program Renewal Biological Resources Report (H. T. Harvey & Associates 2019); habitat and species information from the Santa Clara Valley Habitat Plan (VHP) (ICF International 2012); and other relevant reports, scientific literature, and technical databases.

In addition, for plants, all species on current California Native Plant Society (CNPS) California Rare Plant Rank (CRPR) 1A, 1B, 2A, 2B, 3, and 4 lists occurring in the *Palo Alto*, *Mountain View*, *Milpitas*, *Calaveras Reservoir*, *Mindego Hill*, *Cupertino*, *San Jose West*, *San Jose East*, *Lick Observatory*, *Castle Rock Ridge*, *Los Gatos*, *Santa Teresa Hills*, *Morgan Hill*, *Mt. Sizer*, *Mt. Madonna*, *Gilroy*, *Chittenden*, and *San Felipe* USGS 7.5-minute quadrangles in which the Program Renewal Area is located (for CNPS) as well as within the Program Renewal Area vicinity (for CNDDB) were reviewed. CNDDB (2024) was also queried for natural communities of special concern that occur within the Program Renewal Area, and records of birds reported in nearby areas on eBird (Cornell Lab of Ornithology 2024) were reviewed.

Because Program Renewal activities are proposed for VHP inclusion via an amendment expected to be considered for approval in 2026, VHP mapping of land cover types, including mapping of new Santa Clara County areas for the forthcoming VHP amendment, was used to characterize land cover in the Program Renewal Area for the purpose of this assessment. Where VHP mapping was not available (i.e., in tidal areas), biotic habitats were assessed using a combination of available habitat mapping, a review of aerial imagery, and knowledge of conditions by Valley Water and H. T. Harvey biologists, and habitat types were characterized based on *A Manual of California Vegetation* (Sawyer et al. 2009).

For the purpose of this assessment, the *Program Renewal Area* includes all areas of Santa Clara County up to 1,000 feet in elevation. Because Program Renewal activities will be focused along and adjacent to streams, not all portions of the Program Renewal Area will be impacted by Program Renewal activities. The term *Program Renewal work area(s)* is used to refer to areas where Program Renewal activities will actually occur.

Appendices supporting the biological resources chapter are *Appendix A* (*SMP Manual*), *Appendix C* (*General Plan Policies and Ordinances*), *Appendix E* (*Special-Status Plant Species Considered but Rejected), and Appendix F* (*Mitigation Feasibility Assessment Field Protocol.*

Valley Water Survey Data

Valley Water routinely conducts a variety of surveys and monitoring efforts that provide information on the presence and distribution of sensitive communities and plant and animal species, including special-status species and their habitats, in Valley Water's service area. The following is a summary of Valley Water survey data that support this assessment.

Fish Surveys

Valley Water has collected fish species distribution, occurrence, and abundance data for a variety of projects and Program Renewals and conducted several types of fisheries surveys to meet specific information needs and to monitor for impacts. Such surveys have included:

- conducting habitat typing and mapping;
- collecting water quality data such as temperature, dissolved oxygen, and turbidity;

- identifying fish assemblages; at index reaches and in project locations;
- monitoring upmigration and outmigration of Chinook salmon and steelhead;
- collecting and analyzing steelhead eDNA;
- monitoring juvenile steelhead rearing; and,
- collecting data on species presence, disposition, and abundance at relocation sites.

Examples of studies conducted by Valley Water that provide information on fish use of SMP creeks are listed in Table 3.4-1.

Amphibian and Reptile Surveys

From 2015 to 2022, Valley Water conducted more than 600 surveys for amphibians along or within 73 creeks, channels, wetlands, and basins in the Program Renewal Area, totaling more than 476 miles of survey effort (many surveys were conducted repeatedly in the same locations) (Valley Water, unpublished data). Approximately 396 focused surveys for California red-legged frogs, consisting of paired daytime and nighttime surveys performed in accordance with U.S. Fish and Wildlife Service (USFWS) guidance, were conducted along or within 64 creeks, channels, wetlands, and basins in the Program Renewal Area during this period, representing 318 miles of survey effort. Single adult California red-legged frogs were detected along Llagas Creek at Rucker Avenue in Gilroy in 2016 (this record is unconfirmed), along Berryessa Creek at Piedmont Road in San Jose in 2017, and along Uvas Carnadero Creek south of State Route 25 in 2017. Approximately 422 focused surveys for California tiger salamanders (*Ambystoma californiense*), also consisting of paired daytime and nighttime surveys performed in accordance with USFWS guidance, were conducted along or within 63 creeks, channels, wetlands, and basins in the Program Renewal Area during this period, representing 349 miles of survey effort. No California tiger salamanders were detected during the surveys.

Northwestern pond turtles (*Actinemys marmorata*) (now identified by USFWS as the northwestern pond turtle, and referred to as "northwestern pond turtle" throughout the rest of this chapter) have also been detected by Valley Water during the period from 2016 to 2021 along Lower Silver Creek near Lake Cunningham, along Guadalupe Creek adjacent to the Los Capitancillos Ponds, along Llagas Creek south of State Route 152 in Gilroy, below the Calero Reservoir main dam, along Randol Creek near Cathedral Park, along Coyote Creek below Coyote Dam, along the Guadalupe River at Highway 85, and along Los Gatos Creek at Creekside Way.

Bird Surveys

From 2016 to 2022, Valley Water conducted 42 surveys for least Bell's vireos (*Vireo bellii pusillus*) along Jones Creek, Llagas Creek, the Pajaro River, Tar Creek, Tick Creek, Uvas Carnadero Creek, and Uvas Creek within the Program Renewal Area. No least Bell's vireos were detected during the surveys (Valley Water, unpublished data).

In addition, Valley Water has conducted numerous surveys for nesting birds in support of work activities throughout the Program Renewal Area, as well as year-round surveys for burrowing owls (*Athene cunicularia*) within portions of the Program Renewal Area that provide suitable habitat. These surveys have detected nonbreeding burrowing owls along the Guadalupe River at the Gold Street Bridge in December 2017, and along Coyote Creek at McCarthy Boulevard in October 2020. Valley Water biologists have also conducted surveys for other special-status bird species, such as Swainson's hawk (*Buteo swainsoni*) and California Ridgway's rail (*Rallus obsoletus obsoletus*) (Valley Water, unpublished data).

3.4.2 Regulatory Setting

A number of federal, state, and local laws and ordinances regulate biological resources within the Program Renewal Area. Federal and state regulations that pertain to biological resources are summarized below along with their applicability to Program Renewal activities. Applicable local plans, policies, and regulations laws and ordinances are described in detail in *Appendix C*, *General Plan Policies and Ordinances.* In summary, *Appendix C* discusses several plans throughout Santa Clara County and local jurisdictions that contain relevant programs, strategies, policies and goals to protect habitats and natural areas, special-status plant and wildlife species, and to encourage restoration of stream channels and riparian areas. The plans also contain policies and strategies for protecting trees and maintaining water quality. A discussion on the Santa Clara Valley Habitat Plan and a list of the tree ordinances/regulations are described below due to the relevancy they have to the analysis.

Federal Plans, Policies, Regulations, and Laws

Clean Water Act

The Clean Water Act (CWA) is the primary federal law that protects the quality of the nation's surface waters, including lakes, rivers, and coastal wetlands. The key sections of the CWA that pertain to biological resource regulation are Sections 303, 401, 402, and 404 (discussed hereunder).

Section 401, Water Quality Certification

Under CWA Section 401, applicants seeking a federal license or permit to conduct activities that may result in the discharge of dredged and fill materials into surface waters of the U.S. (including wetlands) must obtain Section 401 Water Quality Certification so that any such discharge will comply with the applicable provisions of the CWA, including Sections 301, 302, 303, 306, and 307, and state water quality standards. Section 401 Water Quality Certification is approved by the state in which the discharge will originate; or, if appropriate, from the interstate water pollution control agency with jurisdiction over affected waters at the point where the discharge will originate. Therefore, all projects that have a federal component and may affect state water quality (including projects that require federal agency approval, such as issuance of a CWA Section 404 permit) also must comply with CWA Section 401. The goal of CWA Section 401 is to include evaluation of water quality when considering activities associated with placement of fill materials into waters of the U.S.

Program Renewal Applicability. As described under the CWA above, any work within waters of the U.S. (i.e., wetlands and other waters) may require a Section 404 fill discharge permit from the U.S. Army Corps of Engineers (USACE) and Section 401 Water Quality Certification and/or a Waste Discharge Requirement from the relevant Regional Water Quality Control Board (RWQCB). Tidal salt marsh, tidal brackish marsh, most freshwater wetlands, and open water habitats (e.g., large waterways, small perennial and intermittent drainages, and wetlands) in the Program Renewal Area generally are considered waters of the U.S., subject to the jurisdiction of the USACE and RWQCB.

Section 404

Section 404 of the Clean Water Act (CWA) prohibits the discharge of dredged and fill materials into waters of the United States (U.S.), including wetlands, without prior USACE authorization. "Discharge of dredged material" and "discharge of fill material" are defined in Title 33, Section 323.2 of the Code of Federal Regulations (33 CFR Section 323.2). "Waters of the United States," including "wetlands," are defined in 33 CFR Section 328.3. On March 24, 2025, the USACE and U.S. Environmental Protection Agency issued a proposed rule indicating that they would engage with State and Tribal regulatory, industry and agricultural stakeholders, environmental and conservation stakeholders, and the public regarding concerns and questions those stakeholders might have regarding the definition of "waters of the U.S."

A May 25, 2023 U.S. Supreme Court decision in *Sackett v. Environmental Protection Agency* limited the definition of jurisdictional wetlands that are considered waters of the U.S. to those wetlands having a continuous surface connection with traditional navigable waters or their tributaries. On August 29, 2023, the U.S. Environmental Protection Agency and USACE issued a final implementing rule to amend the definition of waters of the U.S. to conform with the *Sackett* decision, which was implemented in September 2023. (33 CFR 328.3; 40 CFR 120.2.) On March 24, 2025, the agencies issued a solicitation for public comments to further amend the definition of waters of the United States (90 Fed. Reg. 13428.)

Program Renewal Applicability. Wetland and aquatic habitats likely to be determined to be waters of the U.S. by the USACE are present throughout the Program Renewal Area, and Program Renewal activities will occur within these habitats. Any work within waters of the U.S. (i.e., wetlands and other waters), including relatively large waterways, small perennial and intermittent drainages, tidal salt marshes, tidal brackish marshes, most freshwater

wetlands, and open water habitats may require a Section 404 fill discharge permit from the USACE. Valley Water will apply for a Section 404 permit to support the Program Renewal.

Section 402, National Pollutant Discharge Elimination System

Section 402 of the CWA regulates the discharges of pollutants to waters of the U.S. to limit water quality impacts. Under the Porter-Cologne Water Quality Control Act (Porter-Cologne Act), the State Water Resources Control Board (SWRCB) and the nine regional boards have the responsibility of granting CWA National Pollutant Discharge Elimination System (NPDES) permits for certain point-source and non-point discharges to waters.

Program Renewal Applicability. Various NPDES permits apply to Santa Clara County and to Valley Water. The Municipal Regional Stormwater NPDES permit (Order R2-2009-0074, NPDES Permit No. CAS612008) (MRP) covers municipal stormwater discharges from the majority of Bay Area counties and cities. The SWRCB adopted the Statewide General NPDES Permit for the Regulation of Residual Aquatic Pesticide Discharges to Waters of the U.S. from Algae and Aquatic Weed Control Applications (Water Quality Order 2013-002-DWQ, General Permit # CAG990005). Construction-related stormwater discharges to waters of the U.S. are regulated under the SWRCB's General Permit for Discharges of Storm Water Associated with Construction and Land Disturbance Activities (Construction General Permit) (2022). The Program Renewal will continue to comply with the applicable requirements detailed in the NPDES permits including water quality monitoring and herbicide toxicity control.

Section 303

Under CWA Section 303(d), states are required to identify "impaired water bodies" (those that do not meet established water quality standards), identify the pollutants causing impairment; establish priority rankings for waters on the list; and develop a schedule for development of control plans to improve water quality. Each RWQCB must update the Section 303(d) list every two years. The water bodies on the list have no further assimilative capacity for the identified pollutant, and the Section 303(d) list identifies priorities to develop pollution control plans for each listed water body and pollutant. The pollution control plans triggered by the CWA Section 303(d) List are total maximum daily loads. CWA Section 303 is overseen by the U.S. Environmental Protection Agency (USEPA) and is administered by the SWRCB and its nine RWQCBs. Once a total maximum daily load is developed and approved by the U.S. Environmental Protection Agency, the SWRCB, and the relevant RWQCB, the implementation plan (if included in the total maximum daily load) can be enacted.

Additional details are provided in Chapter 3.14, "Water Quality."

Program Renewal Applicability. The Program Renewal will continue to comply with the requirements detailed in adopted total maximum daily loads, including water quality monitoring and pollutant control. Total maximum daily loads for the Guadalupe River (mercury), San Francisco Bay (mercury and polychlorinated biphenyls), urban creeks (pesticides), the Pajaro River (fecal coliforms, sediment, nutrients, and chlorpyrifos and diazinon) in the Program Renewal Area are detailed under "State Plans, Policies, Regulations, and Laws" in Chapter 3.14, "Water Quality."

Rivers and Harbors Act Section 10

Section 10 of the Rivers and Harbors Act of 1899 prohibits obstruction or alteration of navigable waters of the U.S. without prior USACE authorization. Within the Program Renewal Area, Section 10 jurisdictional waters include all tidally influenced portions (up to the mean high water line) of Guadalupe, Coyote and Alviso Sloughs; as well as the lower reaches of Permanente, Stevens, San Tomas Aquino, Calabazas, San Francisquito, Coyote, and Lower Penitencia Creeks, the Sunnyvale East and West Channels, and the Guadalupe River.

Program Renewal Applicability. Program Renewal activities conducted within or over the tidally influenced portions of Guadalupe, Coyote, and Alviso Sloughs and/or the lower reaches of Permanente, Stevens, San Tomas Aquino, Calabazas, San Francisquito, Coyote, and Lower Penitencia Creeks, the Sunnyvale East and West Channels, and the Guadalupe River, are authorized under the Program Renewal's Regional General Permit (RGP) under the authority of CWA Section 404.

Regional General Permit

The USACE issued an RGP for the Program (File No. SPN-1996-225250S), under the authority of CWA Section 404 (33 U.S. Code [USC] Section 1344) and the Rivers and Harbors Act of 1899 Section 10 (33 USC Section 403) in 2014. The existing RGP was valid for five years from the date of issuance, was then renewed for another five years through 2023, and then extended for an additional three years through 2026. The USACE may either issue an amended RGP or a new RGP for the Program Renewal. Compliance with additional federal regulations will be required by the USACE prior to issuance of a new or amended RGP.

Federal Endangered Species Act – Section 7

FESA was enacted in 1973 to protect plant and wildlife species that have been determined by the USFWS or National Marine Fisheries Service (NMFS) to be at risk of extinction. FESA Section 9 prohibits the take of any fish or wildlife species listed under the FESA as endangered. Take of threatened species under FESA Section 9 is also prohibited, unless otherwise authorized by federal regulations. "Take," as defined by the FESA, means "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." "Harm" is defined as "any act that kills or injures the species, including significant habitat modification." In addition, FESA Section 9 prohibits the "removal or reduction to possession" of any listed plant species "under federal jurisdiction" (i.e., on federal land).

Program Renewal Applicability. Program Renewal maintenance activities may affect a number of federally listed, proposed, and candidate animal species, including the monarch butterfly (*Danaus plexippus*), San Francisco Bay-Delta longfin smelt (*Spirinchus thaleichthys*), southern green sturgeon (*Acipenser medirostris*), Central California Coast (CCC) and South-Central California Coast (SCCC) steelhead (*Oncorhynchus mykiss*), California tiger salamander, California red-legged frog, foothill yellow-legged frog (*Rana boylii*), northwestern pond turtle, California Ridgway's rail, western snowy plover (*Charadrius nivosus nivosus*), least Bell's vireo, salt marsh harvest mouse (*Reithrodontomys raviventris*), and San Joaquin kit fox (*Vulpes macrotis mutica*). The California condor (*Gymnogyps californianus*) and California least tern (*Sternula antillarum browni*) are expected to occur in the Program Renewal Area only as nonbreeding foragers, and no impacts due to Program Renewal activities on these

species are anticipated. No federally listed plant species occur within Program Renewal work areas.

Take of most of these species will be avoided, either because Program Renewal activities will not occur in locations where take can occur, or because implementation of best management practices (BMPs) would avoid take. Following coverage of the Program Renewal under the forthcoming VHP amendment, if Program Renewal activities occur in areas where BMPs may not be adequate to avoid take (e.g., for species that are difficult to detect, such as the California tiger salamander), incidental take approval for VHP-covered federally listed species will be provided via the VHP for VHP-covered activities and species. Where take of federally listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, endangered species consultations will continue to occur on an as-needed basis.

Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (MSA) establishes a national Program Renewal to manage and conserve commercial fisheries of the U.S. through the development of federal Fishery Management Plans (FMPs), and the federal regulation of domestic fisheries under those FMPs, within the 200-mile U.S. Exclusive Economic Zone (16 USC Section 1801 et seq.). Essential Fish Habitat (EFH) is designated for commercially fished species under the MSA. Congress defined EFH for federally managed fish species as "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity." The MSA requires federal FMPs developed by NMFS and the Pacific Southwest Fisheries Management Council to describe the habitat essential to the fish being managed and to describe threats to that habitat from both fishing and non-fishing activities. Pursuant to section 305(b) of the MSA (16 U.S.C. 1855[b]), federal agencies are required to consult with NMFS on actions that may adversely affect EFH for species managed under the FMPs. When NMFS concludes that an action may adversely affect EFH, NMFS is required to provide the action agency with conservation recommendations to protect EFH.

Program Renewal Applicability. Program Renewal maintenance activities in tidal waters and in Coyote Creek may affect EFH. The only fish species subject to a fisheries management plan that occurs in the Program Renewal Area with any regularity is the Chinook salmon (*Oncorhynchus tshawytscha*), which is regulated by the Pacific Fishery Management Council's Salmon FMP. Both Coyote Creek and the San Francisco Bay are officially listed as EFH for this species (Pacific Fishery Management Council 2024a), and Chinook salmon also occur in Los Gatos Creek and the Guadalupe River. Although Chinook salmon currently occurring in the Program Renewal Area have been recognized as strays from hatchery releases (NMFS 1999, Garcia-Rossi and Hedgecock 2002, Valley Water 2018), NMFS still considers habitat used by Chinook salmon in the South Bay as EFH.

Portions of watersheds upstream of the south San Francisco Bay such as Coyote Creek, the Guadalupe River, Permanente Creek, Baron Creek, and Matadero Creek are listed as EFH for the CCC coho salmon (*Oncorhynchus kisutch*). The species was anecdotally reported to occur in Coyote Creek historically, and possibly in the Guadalupe River (Skinner 1962 as cited in Leidy et al. 2005). However, it is unclear whether the species was ever actually present, as the life history of coho salmon is not conducive to its existence in South San Francisco Bay streams under either historical or current conditions. If the species was ever present, it has

been extirpated from these areas (Brown and Moyle 1991, Leidy et al. 2005, Spence et al. 2005). However, NMFS still considers habitat used by Coho salmon in the South Bay as EFH.

A number of fish species regulated by the Coastal Pelagics and Pacific Groundfish FMPs, such as the leopard shark (*Triakis semifasciata)*, English sole (*Parophrys vetulus)*, starry flounder (*Platichthys stellatus*), and big skate (*Raja binoculata*), occur in the tidal habitats of South San Francisco Bay and occasionally disperse upstream into the reaches of Alviso Slough, Coyote Slough, San Francisquito Creek, San Tomas Aquino Creek, and other tidal creeks in the Program Renewal Area (Otolith Geochemistry & Fish Ecology Laboratory 2023). Species such as the northern anchovy (*Engraulis mordax*), Pacific sardine (*Sardinops sagax*), and jack mackerel (*Trachurus symmetricus*) also occur in the South Bay; these species are less likely to occur in the uppermost tidal reaches of sloughs where Program Renewal activities would occur, but small numbers could occur there (Otolith Geochemistry & Fish Ecology Laboratory 2023). Thus, the NMFS may consider these tidal waters to be EFH as well.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (16 USC Section 703), administered by the USFWS, implements four treaties between the U.S. and Canada, Mexico, Japan, and Russia to manage and conserve migratory birds that cross national borders. The MBTA prohibits killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of the Interior. The MBTA protects whole birds, parts of birds, and bird eggs and nests, and prohibits the possession of all nests of protected bird species whether they are active[1] or inactive. Nest starts (nests that are under construction and do not yet contain eggs) and inactive nests are not protected from destruction. "Take" includes most actions, direct and indirect, that can result in take or possession, whether it is temporary or permanent, of any protected species. Although harassment and habitat modification are not identified as take under the MBTA or the California Fish and Game Code (F&G Code); such actions that result in the direct loss of birds, nests, or eggs, including nest abandonment or failure, are considered take under such regulations.

Program Renewal Applicability. All native bird species that occur in the Program Renewal Area are protected under the MBTA except for the California quail (*Callipepla californica*), which is among the groups explicitly exempted from MBTA protection.

Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act of 1940 (16 USC Sec. 668 et seq.) protects eagles from commercial exploitation and safeguards their continued survival in the U.S. This law provides for the protection of the bald eagle (*Haliaeetus leucocephalus*) and the golden eagle (*Aquila chrysaetos*) by prohibiting, except under certain specified conditions, the taking, possession, and commerce of such birds, or their parts, products, nests, or eggs. The USFWS, which enforces the Bald and Golden Eagle Protection Act, can issue permits for the take of eagles under limited circumstances (e.g., for scientific and exhibition use or for traditional and cultural use by Native Americans).

Program Renewal Applicability. Although both bald eagles and golden eagles could nest in the Program Renewal Area, take of these species due to Program Renewal activities will be

[1] An active nest is defined as having eggs or young, as described in the USFWS' June 14, 2018 memorandum "Destruction and Relocation of Migratory Bird Nest Contents."

avoided through the implementation of BMPs. Thus, no Bald and Golden Eagle Protection Act incidental take permit from the USFWS will be necessary.

Marine Mammal Protection Act

The Marine Mammal Protection Act prohibits the take of marine mammals, with certain exceptions, in waters under the jurisdiction of the U.S. or by citizens of the U.S. on the high seas, as well as the importation of marine mammals and marine mammal products into the U.S. Take is defined as "to harass, hunt, capture, or kill, or attempt to harass, hunt, capture, or kill any marine mammal." Harassment is defined as "any act of pursuit, torment, or annoyance which has the potential to injure a marine mammal or marine mammal stock in the wild; or has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering."

Program Renewal Applicability. Small numbers of Pacific harbor seals (*Phoca vitulina richardsi*), which are protected under the Marine Mammal Protection Act, are known to occur in the lower reaches of sloughs in the Program Renewal Area.

State Plans, Policies, Regulations, and Laws

California Porter-Cologne Water Quality Control Act

California's Porter-Cologne Water Quality Control Act (Porter-Cologne Act) was enacted in 1969, and together with the federal CWA, provides regulatory guidance to protect water quality and water resources. The Porter-Cologne Act established the SWRCB and divided California into nine regions, each overseen by a Regional Water Quality Control Board (RWQCB). The Porter-Cologne Act established regulatory authority over "waters of the state," which are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code, Division 7, Section 13050). More specifically, the SWRCB and its nine RWQCBs have jurisdiction over the bed and banks of a stream channel, its riparian corridor, and its beneficial uses.

Program Renewal Applicability. All wetlands and other waters regulated by the USACE under Section 404 of the CWA would also be considered waters of the state by the RWQCB. In addition, the waters of the state would include some wetlands and other waters that are not regulated by USACE, particularly in the wake of *Sackett v. Environmental Protection Agency*, such as wetlands that lack a continuous surface connection to navigable waters. The RWQCB also claims jurisdiction over streams up to top of bank, or to the outer edge of the canopy of riparian trees and shrubs rooted below top of bank, whichever extends farther landward.

Waters of the state are present throughout the Program Renewal Area, and maintenance activities will occur within waters of the state. Any maintenance activities that impact waters of the state would necessitate 401 water quality certification (if a 404 permit from the USACE were needed) and/or a Waste Discharge Requirement from the RWQCB.

Keene-Nejedly California Wetlands Preservation Act

The Keene-Nejedly California Wetlands Preservation Act (AB 2875) was enacted in 2024 to ensure no net loss and long-term gain in the quantity, quality, and permanence of wetlands

(i.e., waters of the state protected under the Porter-Cologne Act) acreage and values in California.

Program Renewal Applicability. To be consistent with this policy, any wetlands considered waters of the state by the RWQCB that may be lost as part of the Program Renewal would need to be replaced at a ratio equal to or greater than 1:1 (impact: mitigation).

Applicability. The Program Renewal will continue to comply with the requirements detailed in adopted total maximum daily loads, Municipal Regional Stormwater NPDES Permit.

As part of the NPDES, municipalities are required to maintain NPDES permits for their stormwater discharges. The municipalities, in turn, require that individual projects within their jurisdiction comply with the requirements of these permits. The MRP (Order R2-2009-0074, NPDES Permit No. CAS612008) covers municipal stormwater discharges from the majority of Bay Area counties and cities.

Program Renewal Applicability. Valley Water complies with the MRP, which mandates that pesticides (in the case of the Program Renewal, specifically herbicides) be used only when other methods such as mulching, mechanical weed abatement, hand pulling/weed abatement, and grazing have proven impracticable. When pesticides are used, the least toxic products that will meet the need are used at the lowest effective rate. All herbicide applicators are required to obtain a Qualified Applicator Certificate or Qualified Applicator License from the California Department of Pesticide Regulation. Valley Water continually works to minimize pesticide use as much as practical. Valley Water's pesticide use is reviewed regularly as part of the compliance effort with the MRP and is consistent with California Department of Pesticide Regulation requirements and court orders for threatened and endangered species, as stipulated by a 2004 United States District Court order, for certain pesticides applied near salmon-supporting waters (see http://www.cdpr.ca.gov/docs/endspec/salmonid.htm for further information). A 2006 USEPA injunction and order for no-use buffer zones surrounding California red legged frog upland and aquatic habitats for certain pesticides may be viewed at http://www.cdpr.ca.gov/docs/endspec/rl_frog/index.htm; portions of the Program Renewal Area that are subject to the injunction are shown on Figure 3.4-1 (all figures for this section are shown at the end of this document).

General NPDES Aquatic Pesticide Use Permit

The SWRCB adopted the *Statewide General NPDES Permit for the Regulation of Residual Aquatic Pesticide Discharges to Waters of the U.S. from Algae and Aquatic Weed Control Applications* (Water Quality Order 2013-002-DWQ, General Permit # CAG990005). This General NPDES permit only authorizes the discharge of the following aquatic pesticides: 2,4-D, acrolein, copper, diquat, endothall, flumioxazin, fluridone, glyphosate, hydrogen peroxide, imazamox, imazapyr, penoxsulam, sodium carbonate peroxyhydrate, and triclopyr-based algaecides and aquatic herbicides, and adjuvants containing ingredients represented by the surrogate nonylphenol. Aquatic pesticides that are applied to waters of the U.S. in accordance with Federal Insecticide, Fungicide, and Rodenticide Act label requirements are not considered pollutants. However, pesticides or by-products that persist in or leave the treatment area after a specified treatment period are considered pollutants and require coverage under this General Permit.

Program Renewal Applicability. All aquatic pesticides used by Valley Water under the General NPDES permit are applied in accordance with the NPDES requirements. As required by the General NPDES Permit, Valley Water conducts aquatic herbicide applications according to a state-approved Aquatic Pesticide Application Plan. Per permit conditions and the Aquatic Pesticide Application Plan, Valley Water's staff record the type of herbicide used and where it has been applied. Annual monitoring reports are submitted to the SWRCB and RWQCB to document aquatic herbicide application events, effectiveness of BMPs, and monitoring data.

McAteer-Petris Act

The McAteer-Petris Act was enacted in 1965 to establish the Bay Conservation and Development Commission (BCDC) to promote responsible planning and regulation of the San Francisco Bay. The McAteer-Petris Act requires that "maximum feasible public access, consistent with a project be included as part of each project to be approved by the BCDC." BCDC jurisdiction in the San Francisco Bay Area extends over the Bay, up to mean high tide and to 5 feet above mean sea level in marshes; and over a 100-foot-wide shoreline band inland from the mean high tide line or the line 5 feet above mean sea level adjacent to marshes. BCDC also has salt pond jurisdiction, which consists of all areas diked off from the Bay and used between August 1966 and August 1969 for the solar evaporation of Bay water in the course of salt production.

Program Renewal Applicability. Any maintenance activities that are conducted within tidal waters of the South San Francisco Bay or areas determined to be within the 100-foot-wide shoreline band may require a permit from the BCDC.

Valley Water is currently authorized to perform SMP activities under BCDC Permit No. M1977 113.07, which expires on April 30, 2026. The existing permit was originally issued in February 1978 and since that time, has been amended seven times. For the Program Renewal, Valley Water will either request an amendment to this BCDC permit or request an extension of five years for the amended permit (Amendment No. 7) through 2030. All maintenance activities will comply with conditions of the Program Renewal's BCDC Permit.

California Endangered Species Act

The California Endangered Species Act (CESA) is defined in Section 2080 et seq. of the Fish and Game Code. CESA prohibits the take of any plant or animal listed or proposed for listing as rare (plants only), threatened, or endangered. In accordance with CESA, the CDFW has jurisdiction over state-listed species (Fish and Game Code 2070).

Like FESA, CESA allows for incidental take of listed species. Take is defined under the F&G Code Section 86 as to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Habitat degradation or modification is not expressly included in the definition of "take" under the Fish and Game Code. However, CDFW has interpreted "take" to include the "killing of a member of a species which is the proximate result of habitat modification."

Program Renewal Applicability. Several state-listed or candidate animal species may occur in the Program Renewal Area and could be impacted by Program Renewal activities, including Crotch's bumble bee (*Bombus crotchii*), San Francisco Bay-Delta longfin smelt, white sturgeon (*Acipenser transmontanus*), California tiger salamander, bald eagle,

Swainson's hawk, California Ridgway's rail, California black rail (*Laterallus jamaicensis coturniculus*), least Bell's vireo, tricolored blackbird (*Agelaius tricolor*), salt marsh harvest mouse, mountain lion (*Puma concolor*), and San Joaquin kit fox. The California condor, bank swallow (*Riparia riparia*), and California least tern are expected to occur in the Program Renewal Area only as nonbreeding foragers, and no impacts due to Program Renewal activities on these species are anticipated. No state-listed plant species occur within Program Renewal work areas.

Take of most of these species will be avoided, either because Program Renewal activities will not occur in locations where take can occur, or because of implementation of BMPs would avoid take. Following coverage of the Program Renewal under the forthcoming VHP amendment, if Program Renewal activities occur in areas where BMPs may not be adequate to avoid take (e.g., for species that are difficult to detect, such as the California tiger salamander), incidental take approval for VHP-covered state-listed species will be provided via the VHP for VHP-covered activities and species. Where take of state-listed species would occur for Program Renewal activities and/or species that are not covered under the VHP, incidental take coverage would be provided via Incidental Take Permits sought by Valley Water from CDFW, on an as-needed basis.

California Fish and Game Code

Lake and Streambed Alteration Program Renewal

California's Lake and Streambed Alteration Program is regulated under Section 1600 et seq. of the California Fish and Game Code. Under Fish and Game Code Section 1602, CDFW regulates projects that affect the flow, channel, or banks of rivers, streams and lakes.

Protection of Birds

California Fish and Game Code Section 3503 prohibits the take, possession or needless destruction of the nests or eggs of any bird, and Section 3503.5 makes it unlawful to take, possess or destroy any bird, nests or eggs of birds of prey (new world vultures, hawks, eagles, ospreys and falcons, and owls). Species protected by the MBTA may not be taken or possessed except as provided by rules and regulations adopted by the Secretary of the Interior in compliance with the MBTA (CDFW Code Section 3513). Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "take" by CDFW.

Fully Protected Species

Species that are fully protected from all forms of take are listed in Fish and Game Code Section 3511 (birds), Section 5515 (fish), Section 4700 (mammals), and Section 5050 (amphibians). Fully protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock. In addition, recent legislation allows Natural Community Conservation Plans (NCCPs) to provide take authorization for fully protected species covered by an NCCP.

Senate Bill 147, approved in 2023, authorizes the CDFW to issue a permit under CEQA authorizing take of a fully protected species due to the implementation of specified projects and under certain conditions.

Program Renewal Applicability. Maintenance activities would occur within the jurisdiction of the CDFW and would require a Streambed Alteration Agreement with CDFW. Valley Water will apply for a Section 1602 Streambed Alteration Agreement for the Program Renewal.

Most native bird, mammal, and other wildlife species occurring in the Program Renewal Area are protected by the California Fish and Game Code. Program Renewal activities, such as vegetation management, may require the removal of vegetation where migratory birds are nesting. Compliance with the Fish and Game Code will be met through implementation of BMPs requiring pre-activity surveys in support of maintenance activities occurring during the nesting season so that take of migratory birds is avoided.

Fully protected species that may occur within Program Renewal work areas are the California condor, bald eagle, golden eagle, white-tailed kite (*Elanus leucurus*), California Ridgway's rail, California black rail, California least tern, salt marsh harvest mouse, and ringtail (*Bassariscus astutus*). The Program Renewal would qualify as a "maintenance project to critical regional or local water agency infrastructure" under Senate Bill 147, and therefore could obtain a take permit under CESA for fully protected species as necessary.

Native Plant Protection Act

The Native Plant Protection Act (Fish and Game Code Section 1900 et seq) is a state law that prohibits take of endangered or rare native plants (with some exceptions). The CNPS has developed a set of lists of native plants in California, categorized according to rarity. Plants on List 1A, List 1B, and List 2 meet the definitions of Fish and Game Code Section 1901 and Sections 2060 and 2067 (CESA) as rare or endangered species.

Program Renewal Applicability. Plants on List 1A, List 1B, and List 2 are fully considered during CEQA review of the Program Renewal in the context of this document.

Regional and Local Plans and Ordinances

Santa Clara Valley Habitat Plan

The VHP (ICF International 2012) provides a framework for promoting the protection and recovery of natural resources, including endangered and threatened species, while streamlining the permitting process for planned development, infrastructure, and maintenance activities. It allows the County of Santa Clara, Valley Water, the Santa Clara Valley Transportation Authority and the cities of Gilroy, Morgan Hill, and San José (collectively, the Local Partners or Permittees) to receive endangered species permits for activities and projects they conduct and those under their jurisdiction. The Santa Clara Valley Open Space Authority also contributed to VHP preparation. The VHP protects, enhances, and restores natural resources in specific areas of Santa Clara County and contributes to the recovery of endangered species. Rather than separately permitting and mitigating individual projects, the VHP evaluates natural-resource impacts and mitigation requirements comprehensively in a way that is more efficient and effective for at-risk species and their essential habitats.

The VHP was developed in association with the USFWS and CDFW and in consultation with stakeholder groups and the general public. The USFWS has issued the Permittees a 50-year permit that authorizes incidental take of covered listed species under FESA, while CDFW has issued a 50-year permit that authorizes take of all covered species under the Natural

Community Conservation Planning Act. This approach allows the Permittees to streamline future mitigation requirements into one comprehensive Program Renewal. In addition to obtaining take authorization for each participating agency's respective activities, the cities and County are able to extend take authorization to project applicants under their jurisdiction.

The VHP provides takes authorization for the following 17 listed and non-listed species (i.e., covered species): coyote ceanothus (*Ceanothus ferrisiae*), Mount Hamilton thistle (*Cirsium fontinale* var. *campylon*), Santa Clara valley dudleya (*Dudleya setchellii*), fragrant fritillary (*Fritillaria liliacea*), Loma Prieta hoita (*Hoita strobilina*), smooth lessingia (*Lessingia micradenia* var. *glabrata*), Metcalf Canyon jewel-flower (*Streptanthus albidus* ssp. [subspecies] *albidus*), most beautiful jewelflower (*Streptanthus albidus* ssp. *peramoenus*), Bay checkerspot butterfly (*Euphydryas editha bayensis*), California tiger salamander, California red-legged frog, foothill yellow-legged frog, northwestern pond turtle, burrowing owl, least Bell's vireo, tricolored blackbird, and San Joaquin kit fox. Although the Tiburon Indian paintbrush (*Castilleja affinis* ssp. *neglecta*) is also a covered species under the VHP, the VHP covers impacts only on the known occurrence of the species at the Kirby Canyon landfill. It does not cover impacts on additional occurrences of Tiburon Indian paintbrush that may be discovered during the permit term.

The USFWS and CDFW also provide assurances to the Permittees that no further commitments of funds, land, or water will be required to address impacts on covered species beyond that described in the VHP to address changed circumstances. In addition to strengthening local control over land use and species protection, the VHP provides a more efficient process for protecting natural resources by creating new habitat reserves that will be larger in scale, more ecologically valuable, and easier to manage than the individual mitigation sites created under the current approach.

The VHP defines measures to avoid, minimize, and compensate for impacts on covered species and their habitats while allowing for the implementation of certain "covered projects" (see Table 3.3-6 of the VHP). Chapter 6 of the VHP includes detailed and comprehensive conditions to avoid and minimize impacts on the 18 covered species included in the plan area. These conditions are designed to achieve the following objectives:

- Provide avoidance of covered species during implementation of covered activities throughout the project site.
- Prevent take of individuals from covered activities as prohibited by law (e.g., take of fully protected species).
- Minimize impacts to natural communities and covered species where conservation actions will take place.
- Avoid and minimize impacts to wetlands and waters throughout the study area to facilitate project-by-project wetland permitting.

In addition, in conformance with the VHP, project proponents are required to pay impact fees in accordance with the types and acreage of habitat or "land cover" impacted. Land cover impacts are used because it is the best predictor of potential species habitat and is applicable to all of the covered species (with the partial exception of the burrowing owl). Surveys to determine presence/absence of species are not required for all species because, to make the provisions of the VHP simple and predictable, covered species are assumed to occupy suitable

habitat in impact areas, and mitigation is based on the assumption of take. VHP fees contribute to the VHP's conservation Program, which includes habitat acquisition, restoration, preservation, and management targeted at the covered species. For the 18 species covered, adherence to the requirements set forth in the VHP, and payment of applicable fees, satisfies any mitigation requirements of CEQA.

The Santa Clara Valley Habitat Agency (Habitat Agency) is currently updating the VHP through a Major Amendment process. The amendment is expected to be considered for approval in 2026, and includes the addition of new covered species, updates to the conservation strategy, adding the Program Renewal as a covered activity, expanding the Plan area boundary, and more. Species proposed to be added as covered species under the amendment include Hall's bush-mallow (*Malacothamnus hallii*), woodland woollythreads (*Monolopia gracilens*), the large marble butterfly (*Euchloe ausonides ausonides*), the monarch butterfly, Crotch's bumble bee, the Swainson's hawk, the mountain lion, the loggerhead shrike (*Lanius ludovicianus*), and the American badger (*Taxidea taxus*).

Program Renewal Applicability. The majority of Program Renewal impacts that require mitigation will be covered under the VHP once it is amended. Program Renewal activities are proposed for VHP inclusion via an amendment expected to be considered for approval in 2026. Following coverage of the Program Renewal under the forthcoming VHP amendment, incidental take approval for VHP-covered federally listed species will be provided via the VHP for VHP-covered activities and species. Impacts of VHP-covered activities will be mitigated via the payment of VHP fees and compliance with VHP conditions.

Local Tree Ordinances

Valley Water is exempt from compliance with tree ordinances of Santa Clara County and various cities within the Program Renewal Area either because the ordinance by its terms is not applicable to Valley Water (e.g., it does not apply to tree removal on public property) and/or because of Hall v. Taft (1956) 47 Cal. 2d 177, 189 (which holds that entities operating under mandates set forth by state law, including water districts, are exempt from municipal police power regulation). Nevertheless, recognizing the importance of protected trees, Valley Water will compensate for tree removal where required within the riparian habitat. Tree ordinances/regulations for each jurisdiction are listed in Table 3.4-2, below and summarized in *Appendix C, General Plans Policies and Ordinances*.

Table 3.4-2. Local Tree Ordinances

Jurisdiction	Ordinance
City of Campbell	• Municipal Code, Title 21, Chapter 21.32 – Tree Protection Regulations • Municipal Code, Title 11, Chapter 11.08 – Street Trees and Parking Strips*
City of Cupertino	• Municipal Code, Title 14, Chapter 14.18 – Protected Trees • Municipal Code, Title 14, Chapter 14.12 – Trees*
City of Gilroy	• Municipal Code, Chapter 26 –Trees
City of Los Altos	• Municipal Code, Title 11, Chapter 11.08 – Tree Protections Regulations • Municipal Code, Title 9, Chapter 9.20 –Trees and Shrubs

Jurisdiction	Ordinance
Town of Los Altos Hills	• Municipal Code, Title 12, Chapter 2 – Trees, Shrubs, and Plants • Municipal Code, Title 12, Chapter 2 – Heritage Oaks • Municipal Code, Title 12, Chapter 2 – Heritage Trees
Town of Los Gatos	• Municipal Code, Chapter 29, Article 1, Division 2 – Tree Protection • Municipal Code, Chapter 26 – Trees and Shrubs
City of Milpitas	• Municipal Code, Title X, Chapter 2 – Tree Maintenance and Protection
City of Monte Sereno	• Municipal Code, Title 10, Chapter 10.15 – Tree Preservation
City of Morgan Hill	• Municipal Code, Title 12, Chapter 12.32 –Restrictions on Removal of Significant Trees
City of Mountain View	• Municipal Code, Chapter 32 – Trees, Shrubs, and Plants
City of Palo Alto	• Municipal Code, Title 8, Chapter 8.04 – Trees, Shrubs, Hedges and Plants • Municipal Code, Title 8, Chapter 8.10 – Tree and Landscape Preservation and Management
City of San Jose	• Municipal Code, Title 13, Chapter 13.32 – Tree Removal Controls • Municipal Code, Title 13, Chapter 13.28 – Street Tree, Hedges, and Shrubs
City of Santa Clara	• Municipal Code, Title 12, Chapter 12. 35 – Trees and Shrubs
City of Saratoga	• Municipal Code, Chapter 15, Article 15-50 – Tree Regulations
City of Sunnyvale	• Municipal Code, Title 19, Article 6, Chapter 19.94 – Tree Preservation
County of Santa Clara	• Municipal Code, Title C, Division C16 – Trees Preservation and Removal

3.4.3 Environmental Setting

Climate and Soils

The Program Renewal Area has a coastal Mediterranean climate characterized by mild, wet winters, and warm, dry summers. This area supports natural biological communities and endemic plant species that are adapted to this precipitation regime, as well as long periods of drought and frequent fire events. Soil types ultimately play a large role in influencing distributions of habitats and wildlife. As detailed in Section 3.9, "Hydrology and Geomorphology," soils vary considerably in the Program Renewal Area. Soils in and immediately surrounding the San Francisco Bay tend to be fine-textured, clayey soils deposited by tidal events. Soils in valley lowland areas and farther inland are very deep, medium-to-fine-textured soils, ranging from poorly to excessively drained. Soils at higher elevations in the valley and the surrounding foothills may be derived from sedimentary, basic igneous, or sometimes serpentine rock with clayey, loamy textured soils (NRCS 2024).

Sensitive serpentine-associated plants and animal communities occur in the Program Renewal Area along the edges of the Santa Clara Valley floor and foothills, including a large area on Coyote Ridge; small serpentine outcrops on the east side of Coyote Valley south to

the San Martin area; areas on the west side of Coyote Valley from the Santa Teresa Hills south to San Martin; small outcrops near Lexington, Calero, and Coyote Reservoirs; and inclusions within the Santa Clara Valley, such as at Communications Hill and Tulare Hill (Figure 3.4-2) (NRCS 2024). These locations support exposed bedrock outcrops, serpentine-derived soils, and/or alluvially deposited serpentine soils. Plant species found on serpentine soils are adapted to or able to tolerate harsh soil conditions, including a low calcium to magnesium ratio; a lack of essential nutrients such as nitrogen, potassium, and phosphorus; and high concentrations of heavy metals such as nickel and chromium that may be toxic to most plant species (Kruckeberg 1984). Thus, other plant species cannot grow in serpentine habitats as easily, and many serpentine-associated plants are special-status endemics that are restricted to serpentine soils.

Natural Communities and Land Cover Types

The Santa Clara Valley, which is dominated by agricultural and developed land uses, extends the length of the Program Renewal Area and is surrounded by the Santa Cruz Mountains to the west, the Diablo Range to the east, and the San Francisco Bay to the north. Plant communities in the Diablo Range to the east include grasslands, chaparral, and oak savannah. Communities to the west in the Santa Cruz Mountains include rolling grasslands, oak woodlands, and mixed hardwood and evergreen forests. Baylands in the north consist mostly of former salt evaporation ponds and remnant marshes and wetlands. As the Program Renewal Area is vast and contains some natural communities and land cover types that may not be subject to disturbance by the Program Renewal, for purposes of this document, only the land cover types that could be directly affected by maintenance activities are described in detail.

Natural communities and land cover types within the Program Renewal Area are classified according to the system described in the VHP (ICF International 2012), with the exception of tidal habitats in the northern portion of the Program Renewal Area, which are excluded from the VHP Program area. These tidal habitats are classified based on *A Manual of California Vegetation* (Sawyer et al. 2009). The dominant and characteristic plant and animal species for each natural community and land cover type that could be affected by Program Renewal activities are described below; VHP land cover types are also described in Section 3.3.5 of the VHP (ICF International 2012). Scientific names of plant species follow the nomenclature used in *The Jepson Manual: Vascular Plants of California* (Jepson Flora Project 2024).

Maps of natural communities and land cover types within the Program Renewal Area are not provided for this assessment due to the large scale of the Program Renewal and the need to field-verify VHP land cover types throughout the Program Renewal Area. VHP natural communities and land cover types within the VHP Plan area are mapped on the Habitat Agency's Geobrowser (Habitat Agency 2024) for areas that are currently within the VHP Program area, and have been mapped in additional areas of Santa Clara County to support the forthcoming VHP amendment. Tidal habitats in the northern portion of the Program Renewal Area are mapped by the San Mateo Resource Conservation District (2024).

Grassland

Based on the projections provided by Valley Water and the locations of potential unprojected work areas, maintenance activities could affect three grassland community types in the Program Renewal Area: rock outcrop (non-serpentine), California annual grassland, and non-serpentine native grassland. Maintenance activities will not geographically overlap

serpentine habitats that are mapped in the Program Renewal Area and described by the VHP, including mixed serpentine chaparral, serpentine bunchgrass grassland, serpentine rock outcrop/barrens, and serpentine seep communities. Due to this, these natural community types are not described here (although detailed descriptions can be found in Section 3.3.5 of the VHP).

CALIFORNIA ANNUAL GRASSLAND

California annual grassland habitat is widespread in the Program Renewal Area and occurs commonly on undeveloped parcels and constructed levees. The largest expanses of this habitat are present on hills surrounding Coyote Valley, in the northern portion of the Santa Teresa Hills, to the east of Anderson Reservoir, and elsewhere along the hilly eastern margin of the Program Renewal Area. This habitat type also extends into Alviso, and along the Valley floor on both sides of upper Coyote Creek north of Morgan Hill. Where grasslands, including those within Program Renewal work areas, are located adjacent to developed areas, they may be maintained by regular mowing.

Grassland communities are characterized by the dominance of grasses and herbaceous plant species, with less than 10 percent cover by trees and shrubs. Dominant plant species in the Program Renewal Area include nonnative annual grasses such as ripgut brome (*Bromus diandrus*), Italian ryegrass (*Lolium multiflorum*), and wild oats (*Avena* sp.). Associated species include many native and nonnative forbs such as California poppy (*Eschscholzia californica*), lupine (*Lupinus* spp.), and filaree (*Erodium* spp.).

Wildlife use of grasslands in much of the Program Renewal Area is limited by human disturbance, the extent of the habitat present in a specific area (which is often limited, especially in Valley floor areas), the high abundance of nonnative and invasive species that typically characterize this habitat, and the isolation of grassland remnants from more extensive grasslands in the region. As a result, some of the wildlife species associated with extensive grasslands, such as the grasshopper sparrow (*Ammodramus savannarum*) and western meadowlark (*Sturnella neglecta*), are absent from less extensive, isolated patches of grassland on the Valley floor, where the majority of Program Renewal activities are projected to occur. However, the more extensive grasslands located on the periphery of the Valley floor (as described above) are contiguous with larger expanses of grassy open space, and thus provide higher-quality habitat for grassland-associated wildlife species.

California ground squirrels (*Otospermophilus beecheyi*), where they are present, are an important component of grassland communities, providing a prey base for diurnal raptors (e.g., hawks and falcons) and terrestrial predators. Burrows of California ground squirrels also provide refugia for common amphibians and reptiles (discussed below), as well as special-status wildlife species such as the burrowing owl and California tiger salamander in portions of the Program Renewal Area where these species occur. Other rodent species that are present in grassland habitats in the Program Renewal Area include the California vole (*Microtus californicus*), valley pocket gopher (*Thomomys bottae*), and deer mouse (*Peromyscus maniculatus*). Diurnal raptors such as red-tailed hawks (*Buteo jamaicensis*), northern harriers (*Circus hudsonius*), white-tailed kites, and American kestrels (*Falco sparverius*) forage for these small mammals over grasslands during the day, and at night nocturnal raptors, such as American barn owls (*Tyto furcata*), forage for nocturnal rodents, such as deer mice. Several grassland-associated special-status bird species, such as the

grasshopper sparrow and loggerhead shrike, nest and forage in more extensive grassland habitats in the Program Renewal Area.

Grasslands provide foraging habitat for common and special-status bats that roost in the Program Renewal Area, such as the pallid bat (*Antrozous pallidus*) and Mexican free-tailed bat (*Tadarida brasiliensis*). A number of terrestrial mammals also occur in grasslands throughout the Program Renewal Area; mammals that are adapted to urban areas such as the coyote (*Canis latrans*), and striped skunk (*Mephitis mephitis*) utilize smaller grassland habitats on the Valley floor, while others such as the American badger and black-tailed jackrabbit (*Lepus californicus*) prefer more extensive grasslands, generally those located on the periphery of the Valley floor. Reptiles such as western fence lizards (*Sceloporus occidentalis*), southern alligator lizards (*Elgaria multicarinata*), western skinks (*Plestiodon skiltonianus*), western terrestrial garter snakes (*Thamnophis elegans*), gopher snakes (*Pituophis catenifer*), racers (*Coluber constrictor*), western rattlesnakes (*Crotalus viridis*), and common kingsnakes (*Lampropeltis getula*) also frequent these habitats.

Non-Serpentine Native Grassland

Native non-serpentine grassland habitat is distributed in small patches throughout portions of the California annual grassland habitat present throughout the Program Renewal Area, and typically includes a component of native purple needlegrass (*Nassella pulchra*) growing in association with nonnatives such as wild oats and ripgut brome. It is relatively rare to find native grasslands dominated (i.e., greater than 50 percent relative percent cover) by purple needlegrass in the Santa Clara Valley.

Due to the limited extent of these areas, wildlife species that occur within non-serpentine native grassland habitat within the Program Renewal Area are those that are associated with California annual grasslands that typically abut or surround these habitats, described above.

Rock Outcrop (Non-Serpentine)

A small area of rock outcrops, consisting of exposed non-serpentine bedrock surrounded by California annual grassland, occurs in the Program Renewal Area north of Alamitos Creek in the Santa Teresa Hills. These rock outcrops are devoid of soil and typically do not support vascular plants except within crevices that have accumulated soil. One exception is that several species of non-special-status dudleya (*Dudleya* spp.) are able to grow in cracks and fractures of the outcrops. In addition, mosses and other epiphytes may grow in some crevices that can retain water for a short duration.

Rock outcrops provide cover, basking opportunities, and foraging habitat for many species of reptiles, including the western fence lizard, southern alligator lizard, western skink, western terrestrial garter snake, gopher snake, and western rattlesnake. Bats, such as the Mexican free-tailed bat, may roost in deep crevices in rock outcrops.

Chaparral and Northern Coastal Scrub

Maintenance activities could affect coyote brush scrub, northern coastal scrub/Diablan sage scrub, and northern mixed chaparral/chamise chaparral, which occur adjacent to projected work locations. These land cover types are described in detail below. Maintenance activities will avoid serpentine habitats throughout the Program Renewal Area, including mixed serpentine chaparral, which is mapped adjacent to maintenance activity areas. Due to this,

this land cover type is not described here (although a detailed description can be found in Section 3.3.5 of the VHP).

COYOTE BRUSH SCRUB

Coyote brush scrub is a type of northern coastal scrub that is dominated by coyote brush (*Baccharis pilularis*). It is considered an early successional scrub type that frequently colonizes former grasslands. Coyote brush scrub composes a relatively small portion of the Program Renewal Area. In portions of the Program Renewal Area where maintenance activities are likely to occur, this community occurs primarily below Coyote Main Dam, at the confluence of Calero Creek and Alamitos Creek, along Coyote Creek, in the hills above Anderson Reservoir, and along Uvas-Carnadero Creek.

This habitat is characterized by drought-tolerant, shrub-dominated landscapes that are exposed to intense sunlight, with dense stands of shrubs that support little understory and are prone to intense and regular fire cycles in natural settings. After a fire event, this habitat recovers quickly and supports extraordinary blooms of annual forbs adapted to fire for several years as the shrub canopy develops. Typical dominant species found in coyote brush scrub communities is California sagebrush (*Artemisia californica*).

Areas where coyote brush scrub habitat occurs in the Program Renewal Area are small and often surrounded by other habitat types, such as annual grassland and oak woodland. Therefore, wildlife utilizing this habitat are typically representative of more extensive adjacent and surrounding habitats. Nevertheless, amphibians are typically absent or scarce due to the very dry conditions, and many other wildlife species occurring here either derive moisture directly from food or synthesize their water metabolically from seeds (e.g., the California pocket mouse [*Chaetodipus californicus*]). Mammals that use chaparral and coastal scrub habitats for cover include the coyote, bobcat (*Lynx rufus*), and brush rabbit (*Sylvilagus bachmani*), among others. Nests of San Francisco dusky-footed woodrats (*Neotoma fuscipes annectens*) often are present where oaks and/or poison oak are mixed with coyote brush scrub. California mice (*Peromyscus californicus*), which occupy woodrat nests, also are present. Bird species that nest in chaparral habitats include the California thrasher (*Toxostoma redivivum*), California towhee (*Melozone crissalis*), spotted towhee (*Pipilo maculatus*), California quail, wrentit (*Chamaea fasciata*), loggerhead shrike, lesser goldfinch (*Spinus psaltria*), and Anna's hummingbird (*Calypte anna*). Rufous-crowned sparrows (*Aimophila ruficeps*) often nest where this habitat supports California sagebrush. Reptiles that occur in these habitats include the gopher snake, western rattlesnake, southern alligator lizard, and western fence lizard.

NORTHERN COASTAL SCRUB/DIABLAN SAGE SCRUB

The northern coastal scrub/Diablan sage scrub land cover type occurs on dry, exposed slopes with shallow soils within the Program Renewal Area. This land cover type can incorporate several different shrub communities, and supports a diverse assemblage of native shrubs such as California sagebrush, black sage (*Salvia mellifera*), and yerba santa (*Eriodictyon californicum*). California buckwheat (*Eriogonum fasciculatum*), sticky monkey flower (*Diplacus aurantiacus*), and bigberry manzanita (*Arctostaphylos glauca*) also occur in this land cover type. In areas with dense shrub cover there is very little herbaceous community; however, occasional openings support both native and nonnative grasses and forbs.

Northern coastal scrub/Diablan sage scrub provides nesting habitat for birds such as the California scrub-jay (*Aphelocoma californica*), California towhee, spotted towhee, wrentit, California thrasher, lesser goldfinch, and Anna's hummingbird. Mammal species that use such scrub habitat include the coyote, California mouse (*Peromyscus californicus*), and brush rabbit. Reptiles that occur here include the gopher snake, western rattlesnake, southern alligator lizard, and western fence lizard.

NORTHERN MIXED CHAPARRAL/CHAMISE CHAPARRAL

Plant species composition, vegetation density, and height vary considerably within this land cover type. In general, northern mixed chaparral/chamise chaparral is characterized by thick-leaved, drought resistant shrubs ranging from very dense with no understory to semi-open stands with variable understory species. Dominant shrubs include manzanita (*Arctostaphylos* spp.), ceanothus (*Ceanothus* spp.), and chamise (*Adenostoma fasciculatum*). Common understory includes poison oak, sticky monkey flower, and yerba santa.

Because northern mixed chaparral/chamise chaparral communities are typically dry and provide relatively low and homogeneous structure, wildlife species diversity in these areas is often low. Wildlife species associated with these communities are often characteristic of larger adjacent or surrounding habitats, such as oak woodlands. The scrub-associated wildlife species described for the northern coastal scrub/Diablan sage scrub community above are expected to occur in the northern mixed chaparral/chamise chaparral community as well.

Oak Woodland

Oak woodland communities are common throughout the Program Renewal Area, and maintenance activities could impact any of the oak woodland community types classified by the VHP. These communities typically occur at elevations above 300 feet in the Program Renewal Area, and are characterized by native California oaks (e.g., coast live oak [*Quercus agrifolia*], valley oak [*Quercus lobata*], and blue oak [*Quercus douglasii*]). Representative understory plants include weedy annual grasses, native and introduced forbs, and occasional shrubs, such as toyon (*Heteromeles arbutifolia*), poison oak (*Toxicodendron diversilobum*), California coffeeberry (*Rhamnus californica*), and common snowberry (*Symphoricarpos albus var. laevigatus*). The special-status species big-scale balsamroot (*Balsamorhiza macrolepis* var. *macrolepis*) and robust monardella (*Monardella villosa* ssp. *globosa*) occur in oak woodland habitats in the Program Renewal Area.

Differences in habitat characteristics between the various oak woodland types that occur throughout the Program Renewal Area are described in the sections below. Because wildlife use of these communities is similar, wildlife species are described here.

All oak woodland habitats produce mast crops that are an important food source for many birds and mammals, including the California scrub-jay, acorn woodpecker (*Melanerpes formicivorus*), California quail, and black-tailed deer (*Odocoileus hemionus*). Small numbers of yellow-billed magpies (*Pica nuttalli*) nest in the crowns of these oaks, particularly in more widely scattered valley oaks. Hollow trees and logs provide denning sites for mammals such as the coyote and striped skunk, while cavities in mature trees are used by cavity-dwelling species including woodpeckers, chestnut-backed chickadees (*Poecile rufescens*), oak titmice (*Baeolophus inornatus*), American kestrels, and white-breasted nuthatches (*Sitta carolinensis*). Bats, such as the California myotis (*Myotis californicus*) and long-eared myotis

(*Myotis evotis*), may use hollows of larger, older oak trees for roosting. San Francisco dusky-footed woodrats also are frequently found in oak woodlands; this species occurs in mixed oak woodland habitat where dense understory vegetation provides cover and foraging opportunities. The native deer mouse and California mouse nest and forage in this habitat as well. Reptiles such as gopher snakes, common garter snakes (*Thamnophis sirtalis*), and western fence lizards occur regularly in this habitat.

Oak woodlands provide cover for bobcats and coyotes that may occasionally wander through these communities. Several species of amphibians, such as the arboreal salamander (*Aneides lugubris*), can be found in oak woodlands, especially where moisture is retained under fallen wood and in crevices in oaks. Reptiles that occur here include the ringneck snake (*Diadophis punctatus*) and western skink.

Valley Oak Woodland

Large, mature, and evenly spaced valley oak trees dominate the overstory of the valley oak woodland land cover type.

Mixed Oak Woodland and Forest

The mixed oak woodland and forest community in the Program Renewal Area contains different oak species in varying levels of dominance. Canopy cover ranges from closed to open, and the three most common oak species are coast live oak, blue oak, and valley oak. Other tree species, including natives and nonnatives, can occur as dominant species or scattered individuals. In most locations where mixed oak woodland and forest adjoins California annual grassland, the understory contains species typical of the California annual grassland community type described above. However, where mixed oak woodland and forest is surrounded by scrub habitat, the woodland understory has more of a shrub component, such as that described for coyote brush scrub above.

Coast Live Oak Forest and Woodland

Coast live oak woodland and forest generally occurs on mesic (moderately moist) slopes and in lowland areas with relatively deep, fertile soil. It typically has a closed canopy, though the canopy can range from closed to open. This community is dominated by stands of coast live oaks and other species. Understory species vary considerably; common natives include toyon, poison oak, and California sagebrush, and common nonnatives often consist of annual grasses.

Blue Oak Woodland

Blue oak woodland is less common in the Program Renewal Area compared to other oak woodland communities. This habitat is characterized by a relatively open and mature canopy of blue oak trees. The understory can vary, but is often similar in composition to adjacent habitats, such as adjacent California annual grasslands.

Foothill Pine-Oak Woodland

Foothill pine-oak woodland generally occurs in drier areas with shallow soils and often intergrades with scrub and chaparral habitats. The dominant tree species is foothill pine (*Pinus sabiniana*). The understory can vary, but is often similar in composition to adjacent

habitats, such as California annual grassland, and is often sparse in some areas due to a buildup of pine needles and thatch.

MIXED EVERGREEN FOREST

Mixed evergreen forest supports a canopy dominated by California bay (*Umbellularia californica*), with a significant, although less dominant, component of Douglas fir (*Pseudotsuga menziesii*). Generally, higher elevation forests support a higher component of Douglas fir, while middle elevations forests are dominated by California bay. Some coast live oak is often present as well; however, it is most prevalent at lower elevations. Due to the dense canopy, understory development within this habitat is generally minimal and consists of sparse shrubs and herbaceous plants such as California blackberry (*Rubus ursinus*), California wood fern (*Dryopteris arguta*), and California rose (*Rosa californica*).

Riparian Forest and Scrub

Riparian forest and scrub communities occur along creeks and rivers in the Program Renewal Area. Because maintenance activities are focused within these areas, the Program Renewal could impact any of the riparian forest and scrub community types classified by the VHP.

Even though riparian land cover is limited in the Program Renewal Area, these habitats contribute a disproportionately high amount to landscape-level wildlife species diversity. The presence of water and abundant invertebrate fauna provide foraging opportunities for many species. The diverse habitat structure provides cover, nesting opportunities, and migratory corridors for many wildlife species in the region, supporting the most diverse bird communities in the Program Renewal Area (Rottenborn 1997).

As a result of the long history of human disturbance, isolation, and other urban-associated pressures that began in the late 1700s, many riparian habitats in the Program Renewal Area have undergone a shift in composition. For example, Grossinger et al. (2007) documented a substantial shift in land cover along much of Coyote Creek, from relatively open sycamore alluvial woodland, riparian scrub, and unvegetated gravel bars to more dense and homogeneous riparian forest. In addition, riparian forests and woodlands in the Program Renewal Area are predominately restricted to narrow corridors along streams, and many reaches of streams support little or no woody vegetation. In some areas, channels are lined with concrete, riprap, or gabions (e.g., along the Guadalupe River near Hillsdale Avenue). Although native trees dominate most riparian woodlands and forests in the Program Renewal Area, nonnatives abound as well, and exotic species such as eucalyptus (*Eucalyptus* spp.), giant reed (*Arundo donax*), tree-of-heaven (*Ailanthus altissima*), elms (*Ulmus* spp.), and others.

In some areas, riparian forests and woodlands have been protected, and in some cases restored (particularly along the larger streams such as Coyote Creek and the Guadalupe River), by Valley Water and others. Conversely, where riparian forests and woodlands pass through urban areas, disturbance from unhoused individuals has contributed to the degradation of these habitats. Over the past several years, unhoused encampments, with associated trash and debris, have increased along urban streams in the Santa Clara Valley. These encampments contribute to contamination of waterways and damage to riparian communities (e.g., due to destabilization of stream banks). Encampments may also result in increased fire risk due to the presence of abundant fuel along the riparian corridor and the

use of cookstoves/propane by unhoused individuals. Wildfire damage has occurred along some urban streams in the Program Renewal Area.

WILLOW RIPARIAN FOREST AND SCRUB

Willow riparian forest and scrub is the most common riparian habitat in the Program Renewal Area. This community occurs along the majority of drainages in the Santa Clara Valley.

Willow species, such as the red willow (*Salix laevigata*), arroyo willow (*Salix lasiolepis*), and sandbar willow (*Salix exigua*), as well as mulefat (*Baccharis salicifolia*), dominate willow riparian forests, woodlands, and scrub habitat in the Program Renewal Area. Most willow riparian habitat in the Program Renewal Area, especially within and near urban areas, also supports invasive trees such as black locust (*Robinia pseudoacacia*), holly oak (*Quercus ilex*), eucalyptus, tree-of-heaven, and elms, as well as invasive herbaceous plants such as periwinkle (*Vinca major*) and English ivy (*Hedera helix*), which often dominate the understory. Other willow riparian habitats, especially those located farther away from urban areas or where restoration has occurred, contain native understory species such as California blackberry, poison oak, toyon, and Mexican elderberry (*Sambucus mexicana*).

Extensive willow riparian habitats that support large, mature riparian trees occur along certain reaches of Coyote Creek and the Guadalupe River, with less extensive reaches dominated by mature trees occurring along other SMP-maintained streams in the Program Renewal Area as well. Dominant native canopy species in these areas include willows and Fremont cottonwoods (*Populus fremontii*), along with native understory species such as elderberry and wild rose (*Rosa californica*).

The wider, more mature willow riparian corridors in the Program Renewal Area support suitable foraging and breeding habitat for several functional groups of birds including insectivores (e.g., warblers, flycatchers), seed-eaters (e.g., finches), raptors, and cavity-nesters (e.g., swallows and woodpeckers). Among the numerous species of birds that use the riparian habitats in the Program Renewal Area for breeding are the western flycatcher (*Empidonax difficilis*), black-headed grosbeak (*Pheucticus melanocephalus*), warbling vireo (*Vireo gilvus*), yellow warbler (*Setophaga petechia*), belted kingfisher (*Ceryle alcyon*), and black-chinned hummingbird (*Archilochus alexandri*). Riparian habitats also support many native migrant and wintering bird species such as the Swainson's thrush (*Catharus ustulatus*) and Wilson's warbler (*Cardellina pusilla*).

Several species of reptiles and amphibians occur in these riparian corridors in the Program Renewal Area. Leaf litter, downed tree branches, and fallen logs provide cover for the arboreal salamander, western toad (*Anaxyrus boreas*), and Pacific tree frog (*Pseudacris regilla*). Several lizards may also occur here, including the western fence lizard, western skink, and southern alligator lizard. Northwestern pond turtles and nonnative red-eared sliders (*Trachemys scripta*) use riparian habitat, particularly for breeding and winter aestivation. Small mammals such as the ornate shrew (*Sorex ornatus*), California vole, and Audubon's cottontail (*Sylvilagus audubonii*) use these riparian habitats as well. San Francisco dusky-footed woodrats occur, often at high densities, in riparian habitats in less developed areas, but they are typically absent from heavily urbanized streams. Medium-sized mammals, such as the raccoon (*Procyon lotor*) and striped skunk, also are common in this habitat. Nonnatives such as the Virginia opossum (*Didelphis virginiana*), eastern fox squirrel (*Sciurus*

niger), Norway rat (*Rattus norvegicus*), red fox (*Vulpes vulpes*), and feral cat (*Felis catus*), which are more common within and near urban portions of the Program Renewal Area, may harass, compete with, or depredate eggs and young of native birds and small mammals in riparian habitats, reducing the quality of this habitat for native riparian-associated wildlife species.

Central California Sycamore Alluvial Woodland

Central California sycamore alluvial woodland, a CDFW sensitive natural vegetation community (CDFW 2024a), is uncommon in the Program Renewal Area and occurs along Pacheco Creek east of Gilroy, along Coyote Creek above Coyote Reservoir, along upper Tar Creek, and along Coyote Creek below Coyote Reservoir in Coyote Valley. Within these areas, sycamore woodland is found on broad valley floors along low, braided riparian channels, and usually only along low-gradient streams flowing over deep alluvial deposits. However, alluvial fan geomorphic landscape where this habitat type may have been more common historically has largely been converted over the past 100-150 years in stages to agriculture and urban development with manipulated streamflow and channel engineering, creating a very different disturbance regime (San Francisco Estuary Institute 2006, San Francisco Estuary Institute-Aquatic Science Center and H. T. Harvey & Associates 2017).

Sycamore alluvial woodland stands have an open canopy dominated by western sycamore (*Platanus racemosa*), often interspersed with white alder (*Alnus rhombifolia*) and willows. Other associated tree species may include valley oak, coast live oak, and California bay. Winter flows typically scour the understory vegetation each season, and as such, herbaceous vegetation is spare and patchy. Species such as willows, coyote brush, mulefat, California buckeye (*Aesculus californica*), blackberry (*Rubus* spp.), Italian thistle (*Carduus pycnocephalus*), poison oak, common chickweed (*Stellaria media*), and bedstraw (*Galium aparine*) may occur along the outer stream banks.

Sycamore alluvial woodlands provide habitat for many of the wildlife species discussed under *Willow Riparian Forests, Woodlands, and Scrub* above. In addition, large sycamore trees present in this community provide roosting habitat for a number of species of bats, including the pallid bat, Mexican free-tailed bat, Yuma myotis (*Myotis yumanensis*), California myotis, and big brown bat (*Eptesicus fuscus*). Cavity-nesting bird species, such as woodpeckers and American kestrels, are also likely to be found nesting in this habitat. Raptors such as red-tailed hawks, red-shouldered hawks (*Buteo lineatus*), and great-horned owls (*Bubo virginianus*) nest in the larger trees in this habitat and forage in adjacent areas. Species that prefer thick understory cover, such as towhees and sparrows, are less abundant in sycamore woodlands compared with other riparian habitats.

Mixed Riparian Woodland and Forest

Mixed riparian woodland and forest habitat is widespread along streams in the Program Renewal Area, including along Pacheco Creek, Uvas-Carnadero Creek, Llagas Creek, Coyote Creek, Calero Creek, Calero Creek, Alamitos Creek, and Thompson Creek. This community is composed of white alder, Fremont cottonwood, western sycamore, coast live oak, valley oak, California bay, and box elder (*Acer negundo*). Understory trees and shrubs include willows, California buckeye, blackberry, and poison oak.

The structural diversity of mixed riparian woodland and forest in the Program Renewal Area supports high diversities of riparian-breeding species, and many of the same species found

in willow riparian forests also are present in mixed riparian habitats. However, the lower vegetation volume within mixed riparian woodland and forest results in lower bird densities compared to willow riparian forest. Nevertheless, wildlife species that prefer riparian habitats with lower-density vegetation and higher structural diversity are likely to be present throughout this habitat type, including the chestnut-backed chickadee, oak titmouse, bushtit (*Psaltriparus minimus*), black phoebe (*Sayornis nigricans*), California scrub-jay, northern house wren (*Troglodytes aedon*), American robin (*Turdus migratorius*), and dark-eyed junco (*Junco hyemalis*), as well as several species of finches. Raptors, such as red-shouldered hawks and Cooper's hawks (*Accipiter cooperii*), nest within these riparian corridors and forage in adjacent habitats. Oak, cottonwood, and sycamore trees also support cavity-nesting bird species such as woodpeckers and American kestrels, as well as colonies of roosting bats.

RIVERINE (STREAMS)

Streams in the Program Renewal Area include perennial streams and rivers that provide surface flow year-round, intermittent streams that have surface flow (with some groundwater contribution) for a portion of the year but are dry for at least several months in most years, and ephemeral streams that contain surface runoff only for brief periods following rain events. Flows within streams below reservoirs and pipelines are augmented by managed water releases from these sources, thus maintaining perennial conditions.

Three general stream types occur in the Program Renewal Area: natural, mixed, and concrete. Natural channels are streams that have unmodified beds and banks. Mixed channels are modified and often lined with excavated earth, rock rip-rap, gabions, concrete, or flood walls, but support earthen stream-bottoms. Concrete channels are defined by concrete lining present in the channel bed. Creek and stream channels may be vegetated with wetland vegetation, riparian vegetation, or open water, depending on the extent and type of modification applied.

Amphibians such as the native western toad and Pacific tree frog and nonnative bullfrog (*Lithobates catesbeianus*) are common in perennial and longer-lasting intermittent creeks and streams throughout the Program Renewal Area. The native northwestern pond turtle is present in low numbers in some reaches of these streams, as are several species of nonnative turtles that have been released locally from captivity such as red-eared sliders and painted turtles (*Chrysemys picta*). Waterbirds, such as the mallard (*Anas platyrhynchos*), green heron (*Butorides virescens*), great egret (*Ardea alba*), and belted kingfisher forage in these waters. Bats, including the Yuma myotis and big brown bat, forage aerially on insects over these streams.

A number of fish also use the creek and stream channels in the Program Renewal Area, including several species of native fish. The rivers and creeks of Santa Clara County are home to over 20 native and over 20 nonnative species of fish (Valley Water 1995; Leidy 2007; Smith 2019; Valley Water 2008, 2008b, 2019, 2020, 2021; Valley Water unpublished data).

According to Valley Water fish sampling and relocation data (2002-2013); various Valley Water fish monitoring efforts within Stevens Creek, Guadalupe River, and Coyote Creek watersheds (Smith 2019; Valley Water 2008, 2008b, 2019, 2020a, 2021a; Valley Water unpublished data); and Leidy (2007), the most common native fish in Program Renewal Area streams draining to San Francisco Bay include the southern coastal roach (*Lavinia symmetricus*), prickly sculpin (*Cottus asper*), Sacramento sucker (*Catostomus occidentalis*),

and threespine stickleback (*Gasterosteus aculeatus*), which occur in most watersheds and sub-watersheds in the Program Renewal Area. The CCC steelhead and Central Valley fall-run Chinook salmon are anadromous fish that spawn in several of these streams, such as Stevens Creek, Coyote Creek, Upper Penitencia Creek, the Guadalupe River, and Los Gatos Creek (Independent Science Advisors 2006, Smith 2019, Valley Water 2020). The native, anadromous Pacific lamprey (*Entosphenus tridentata*) has been observed in several streams in the Program Renewal Area such as the Guadalupe River, Coyote Creek, and Upper Penitencia Creek (Stillwater Sciences 2018, Valley Water 2020a, 2021a). The creeks in the Pajaro River basin, which drain to Monterey Bay, support many of the same species as the creeks draining into San Francisco Bay. Dominant native fish species occurring in these creeks include species such as the Pacific lamprey, southern coastal roach, Monterey hitch (*Lavinia exilicauda harengus*), pikeminnow (*Ptychocheilus grandis*), threespine stickleback, and riffle sculpin (*Cottus gulosus*), as well as the SCCC steelhead (Smith 1982).

A number of nonnative fish have been introduced to the Program Renewal Area, such as mosquitofish (*Gambusia affinis*), largemouth bass (*Micropterus salmoides*), bluegill (*Lepomis macrochirus*), pumpkinseed (*Lepomis gibbosus*), green sunfish (*Lepomis cyanellus*), common carp (*Cyprinus carpio*), goldfish (*Carassius auratus*), fathead minnow (*Pimephales promelas*), bigscale logperch (*Percina macrolepida*), inland silverside (*Menidia beryllina*), yellow fin goby (*Acanthogobius flavimanus*), golden shiner (*Notemigonus crysoleucas*), red shiner (*Cyprinella lutrensis*), striped bass (*Morone saxatilis*), and threadfin shad (*Dorosoma petenense*).

Conifer Woodland

Based on the locations of potential unprojected work areas, maintenance activities could affect two conifer woodland community types in the Program Renewal Area: ponderosa pine woodland and redwood forest. Maintenance activities will avoid knobcone pine woodland in the Program Renewal Area, as this community occurs only at higher elevations and is not located near any projected work areas. Thus, knobcone pine woodland is not described here (although a detailed description can be found in Section 3.3.5 of the VHP).

REDWOOD FOREST

Redwood forests of the Santa Cruz Mountains occur along ocean-facing canyons, on coastal slopes, and along riparian corridors that receive high winter rainfall as well as coastal fog. Douglas fir and the broadleaved species madrone (*Arbutus menziesii*), tanbark oak (*Lithocarpus densiflorus*), and California bay are important components of this habitat on drier slopes and ridges. Homogeneous stands of coast redwood occur in moist areas such as along ravines and associated slopes, which provide adequate water to support this species. Soils in redwood forests are typically well-developed and rich in organic matter. Shade-loving herbs such as western sword fern (*Polystichum munitum*), bracken fern (*Pteridium aquilinum*), redwood violet (*Viola sempervirens*), California strawberry (*Fragaria californica*), and redwood sorrel (*Oxalis oregana*) are common understory species. Shade-tolerant trees, particularly tanbark oak, madrone, and, along watercourses, bigleaf maple (*Acer macrophyllum*) and red alder (*Alnus rubra*), may also be present beneath the dense canopy.

Understory plants in redwood forests provide foraging opportunities for a number of wildlife species, although tannins and other compounds produced by redwoods deter many invertebrates, resulting in limited foraging opportunities for many insectivorous wildlife species. Small mammals that occur in this habitat include the Trowbridge's shrew (*Sorex trowbridgei*), broad-handed mole (*Scapanus latimanus*), and California myotis. Several

species of amphibian thrive in the moist environment of the redwood forest floor and associated small creeks, including the California giant salamander (*Dicamptodon ensatus*) and California newt (*Taricha torosa*). Common birds in redwood forests include the western screech-owl (*Megascops kennicottii*), Steller's jay (*Cyanocitta stelleri*), common raven (*Corvus corax*), chestnut-backed chickadee, brown creeper (*Certhia americana*), Pacific wren (*Troglodytes pacificus*), and western flycatcher. Redwood forests also support banana slugs (*Ariolimax columbianus*), as well as many species of arachnids and other invertebrates.

Ponderosa Pine Woodland

Ponderosa pine woodland is extremely limited in the Program Renewal Area, occurring only at higher elevations in the foothills of the Diablo Range near the upper limit of the 1,000-foot elevation limit for the Program Renewal Area. Within this habitat, ponderosa pines (*Pinus ponderosa*) grow in widely spaced stands, typically with an understory of California annual grassland and few to no shrub species present. Additional tree species that may be present in this habitat include black oak (*Quercus kelloggii*), coast live oak, and Pacific madrone, and bigberry manzanita shrubs may also occur in some areas.

Due to the limited distribution of ponderosa pine woodland in the Program Renewal Area, wildlife species that use this habitat are expected to be characteristic of adjacent, more extensive land cover types (i.e., the California annual grassland and oak woodland natural community types discussed above). In addition, because this habitat is relatively open, wildlife species associated with dense cover and understory vegetation are not expected to make regular use of this habitat.

Wetland

Because Program Renewal maintenance activities are focused within wetland areas, the Program Renewal could impact both of the wetland community types classified by the VHP (i.e., coastal and valley freshwater marsh and seasonal wetland).

Coastal and Valley Freshwater Marsh

In the Program Renewal Area, coastal and valley freshwater marsh communities typically occur in relatively long, linear patches, such as those along the lower freshwater reaches of streams that feed into the San Francisco Bay (e.g., Saratoga Creek, Calabazas Creek, Permanente Creek, Guadalupe River); along Guadalupe Creek near the Los Capitancillos Percolation Ponds; and along Coyote Creek in the region of the Coyote Creek Park Chain.

Freshwater marshes are present primarily where perennial or near-perennial inundation by shallow, fresh water occurs in an open (i.e., not wooded) environment. These marshes typically are densely vegetated and dominated by bulrush (*Scirpus* spp.), rushes (*Juncus* spp.), sedges (*Cyperus* spp.), bur reed (*Sparganium* spp.) and cattails (*Typha* spp.). Other common freshwater marsh herbaceous species in the Program Renewal Area are native and nonnative smartweeds (*Polygonum* or *Persicaria* spp.) and primrose (*Ludwigia* spp.).

Freshwater marshes provide habitat for numerous bird species including ducks, gulls, terns, herons, egrets, and other waterbirds. The sora (*Porzana carolina*) and Virginia rail (*Rallus limicola*) forage in freshwater marshes in the Program Renewal Area during migration and in winter. American coots (*Fulica americana*), common moorhens (*Gallinula chloropus*), pied-billed grebes (*Podilymbus podiceps*), and several species of ducks breed in freshwater

wetlands located in channels and ponds in the Program Renewal Area. Passerine species that breed in these marshes include the marsh wren (*Cistothorus palustris*), song sparrow (*Melospiza melodia*), common yellowthroat (*Geothlypis trichas*), and red-winged blackbird (*Agelaius phoeniceus*). A variety of finches, sparrows, and other birds that nest in nearby habitats will also use these wetlands for cover and foraging habitat. Amphibians such as the native Pacific tree frog and western toad, as well as the nonnative American bullfrog, also are present in this habitat. Common garter snakes and western terrestrial garter snakes forage in these wetlands for amphibian larvae.

Seasonal Wetland

Seasonal wetlands in the Program Renewal Area typically occupy smaller, more discrete areas compared to freshwater marshes. They are also found intermixed with freshwater marsh communities along Coyote Creek in the Coyote Creek Park Chain area, and in the southern portion of the Program Renewal Area along Tar Creek, Tick Creek, and Uvas Creek.

Seasonal wetlands form during the rainy season, typically in topographic low areas with underlying confining soil layers (generally clays and silts) that prevent water from percolating into the ground. Seasonal wetlands also may form in areas with seasonally high groundwater tables. Dominant plant species in these wetlands can include those listed above for freshwater marshes, as well as rushes and sedges such as tall umbrella sedge (*Cyperus eragrostis*), but more commonly consist of nonnative annual hydrophytic species such as rabbitsfoot grass (*Polypogon monspeliensis*), hyssop loosestrife (*Lythrum hyssopifolium*), white sweetclover (*Melilotus albus*), and bristly ox-tongue (*Picris echioides*).

Wildlife use of seasonal wetlands in the Program Renewal Area depends largely on the duration and depth of ponding, the extent of open water, and the structure and type of emergent vegetation present. Most of the seasonal wetlands in the Program Renewal Area provide little open water, and they generally do not provide deep water. As a result, they are used primarily for winter and spring foraging by waterbirds, such as shorebirds, ducks, and geese, rather than as a year-round resource. Wetland-associated birds such as song sparrows and red-winged blackbirds will nest in these habitats where they support tall, dense emergent vegetation. A variety of finches, sparrows, and other birds that nest in nearby habitats will also use these wetlands for cover and foraging habitat. Seasonal wetlands that provide standing water for at least several months support successful breeding by amphibians such as western toads and Pacific tree frogs, while seasonal wetland swales that do not provide sufficient ponding provide only foraging habitat and moist refugia for these amphibians. In some areas, seasonal wetlands provide suitable breeding conditions for California tiger salamanders, if they hold water through May, and for California red-legged frogs, if they hold water into July. Common garter snakes and western terrestrial garter snakes forage in these wetlands for amphibian larvae.

Open Water

Program Renewal activities could impact either of the open water community types classified by the VHP (i.e., pond and reservoir). These open water habitats are permanently or semi-permanently flooded, and support less than 5 percent vegetation in emergent or submerged states. Isolated ponds, reservoirs, percolation ponds (off-stream groundwater recharge ponds), rivers, streams, and ditches, as well as tidal/intertidal habitats (discussed separately below as non-VHP community types) represent open water habitat in the Program Renewal Area.

POND

Very few naturally occurring ponds exist in the Program Renewal Area. Many human-made ponds, including old gravel excavation sites, stock ponds, or ornamental ponds associated with golf courses and parks, do occur.

Amphibian species that breed in ponds throughout the Program Renewal Area include the native Pacific tree frog and western toad, as well as the nonnative bullfrog. Northwestern pond turtles are known to occur in ponds on the Santa Teresa Golf Course and other small ponds throughout the Program Renewal Area (H. T. Harvey & Associates 1999a and 2012a, CNDDB 2024). Several nonnative turtle species have been introduced into pond habitats in the Program Renewal Area as well. California tiger salamanders are known to breed in seasonal ponds on the periphery of the Program Renewal Area where upland aestivation habitat is available and nonnative aquatic predators, such as bullfrogs, green sunfish, mosquitofish, and Louisiana red crayfish (*Procambarus clarkii*), are absent (H. T. Harvey & Associates 1999c and 2012b). California red-legged frogs are also known from ponds in a few locations on the periphery of the Program Renewal Area; however, this species is largely absent from urbanized and agricultural portions of the Valley floor (H. T. Harvey & Associates 1997). Common resident birds that occur in larger ponds throughout the Program Renewal Area include the pied-billed grebe, double-crested cormorant (*Phalacrocorax auritus*), great egret, snowy egret (*Egretta thula*), Canada goose (*Branta canadensis*), mallard, common merganser (*Mergus merganser*), American coot, and killdeer (*Charadrius vociferus*), among others. Numerous species of wintering ducks, such as the northern shoveler (*Anas clypeata*), lesser scaup (*Aythya affinis*), and bufflehead (*Bucephala clangula*) occur in these habitats during fall and winter. Shorebirds, such as the greater yellowlegs (*Tringa melanoleuca*), spotted sandpiper (*Actitis macularius*), and others, forage and roost at the edges of these habitats during migration and winter. Additionally, a variety of mammals come to ponds to drink.

The Coyote Creek Reach 1A pond along lower Coyote Creek was created and is managed specifically for waterbird use and provides habitat for numerous shorebirds, waterfowl, gulls, terns, and larger waders. Regular monitoring by the San Francisco Bay Bird Observatory of this 16-acre pond recorded more than 57 species of waterbirds, the most common of which were dowitchers (*Limnodromus spp*.), American avocets (*Recurvirostra americana*), northern shovelers, and California gulls (*Larus californicus*) (Strong 2003). Additional birds using this pond include pectoral sandpipers (*Calidris melanotos*), western sandpipers (*Calidris mauri*), and Wilson's phalaropes (*Phalaropus lobatus*), as well as large numbers of nesting American avocets, black-necked stilts (*Himantopus mexicanus*), and ducks (Strong 2003).

RESERVOIR

There are 10 reservoirs in the Program Renewal Area: Anderson, Calero, Chesbro, Coyote, Guadalupe, Lexington, Stevens Creek, Uvas, Vasona, and Almaden. These reservoirs were constructed to provide water supply and storage uses for county residents. Reservoirs have altered hydrology of downstream areas by reducing spring runoff events, dampening flood peaks and frequency, and supplying water to creeks that would normally be dry during summer months. They also retain sediment, preventing natural sediment dispersal throughout the watershed. Although no Program Renewal activities would occur in the reservoirs, these reservoirs influence the biological resources present in reaches both above and below them.

Additional water bodies in the Program Renewal Area that are mapped as reservoir by the VHP include the Parkway Lakes, Lake Cunningham, Almaden Lake, and percolation ponds along Los Gatos, Llagas, Coyote, Upper Penitencia, Stevens, and Guadalupe Creeks, the Guadalupe River, and Madrone Channel. Of these, maintenance activities are projected to occur only in Almaden Lake, which is an in-channel lake connecting Alamitos Creek with the Guadalupe River downstream.

All of the waterbird and shorebird species described under *Pond* above will also use reservoirs in the Program Renewal Area. In addition, cormorants, gulls, and pelicans exhibit movements between foraging areas at inland reservoirs in the South Bay, and ospreys (*Pandion haliaetus*), Forster's terns (*Sterna forsteri*), and Caspian terns (*Sterna caspia*) forage for fish in a number of reservoirs in the Program Renewal Area. Since the late 1990s, small heron rookeries have become established on islands in inland reservoirs in the South Bay; these herons and egrets forage largely on fish in these waterbodies.

Northwestern pond turtles are known to occur in several Valley Water reservoirs (Almaden, Calero, Chesbro, Anderson, Uvas, Stevens Creek, Lexington, etc.) (H. T. Harvey & Associates 1999a and 2012a, CNDDB 2024), and this species may occur in reservoir habitats throughout the Program Renewal Area. Several nonnative turtle species have also been introduced into reservoirs in the Program Renewal Area. Most of the fish occurring in Program Renewal Area reservoirs are nonnative; however, the native Sacramento hitch (*Lavinia exilicauda exilicauda*) has been observed in warm water impounded areas such as Anderson and Coyote reservoirs (Leidy 2007, Valley Water 2021c).

Irrigated Agriculture

Agricultural land cover types are common in the Program Renewal Area, with small remnant patches of agricultural lands occurring inside city limits in northern Santa Clara County, and larger (often actively managed) agricultural areas present in southern Santa Clara County. In addition to livestock and poultry, agricultural land uses in Santa Clara County include field crops (e.g., alfalfa, grain, pasture), bushberries, strawberries, floral crops, forest products, fruits and nuts, vegetable crops, seed crops, and nursery crops (e.g., bedding plants, ornamental trees and shrubs, Christmas trees) (Santa Clara County Department of Agriculture 2022). These land cover types occur adjacent to projected Program Renewal work areas in many locations.

ORCHARD

Orchards in the Program Renewal Area consist of farmland with cultivated fruit or nut trees (e.g., English walnut [*Juglans regia*], fruiting trees such as plums [*Prunus* spp.], and others). The understory of these areas is typically limited and maintained frequently by mowing or other methods but may consist of nonnative annual grasses or bare ground.

Orchards in the Program Renewal Area support relatively few wildlife species due to pesticide use, frequent disturbance associated with farming activities, the low stature of the crops produced in most of these areas, and the lack of structural diversity in the vegetation in these areas. Rodent control reduces the abundance of small mammals and makes these areas generally unsuitable as foraging habitat for raptors and larger mammals. Nevertheless, small numbers of California ground squirrels, valley pocket gophers, and other small mammals will occur in these areas, often along margins of fields, and raptors such as red-tailed hawks, American kestrels, and white-tailed kites will forage in orchards where these

species are present. Birds such as Brewer's blackbirds (*Euphagus cyanocephalus*), American robins, and American crows (*Corvus brachyrhynchos*) nest and forage in these orchards. A number of mammals, including the coyote, black-tailed deer, American badger, raccoon, and bobcat may move through orchards in the Program Renewal Area. However, orchards provide little cover and few food resources for carnivorous species, and most mammal movement through the Program Renewal Area is expected to occur through habitats offering more resources for these species.

VINEYARD

Vineyards in the Program Renewal Area are similar to orchards but consist of cultivated grapes (*Vitis* spp.). The understory of these areas is similarly limited and maintained frequently by mowing or other methods but may consist of nonnative annual grasses or bare ground. Wildlife use of these areas is similar to wildlife use of orchards described above; however, bird nesting in vineyards is limited due to the lack of trees as well as frequent disturbances.

AGRICULTURE DEVELOPED

Large agricultural buildings, corrals, dairies, and other agricultural infrastructure in the Program Renewal Area do not typically support substantive vegetation due to the presence of livestock and high levels of human disturbance. Wildlife use of these areas is also extremely limited due to a lack of foraging resources and vegetative cover. Species that occur in these areas include the nonnative rock pigeon (*Columba livia*), and European starling (*Sturnus vulgaris*), which may nest in agricultural buildings and other infrastructure. Native species such as the Brewer's blackbird and brown-headed cowbird (*Molothrus ater*) will also occur here, but nest in surrounding areas. Other native birds, such as the black phoebe, will nest on agricultural buildings and forage for insects (e.g., flies) where livestock are present. Nonnative mammals such as the black rat (*Rattus rattus*), house mouse, and others are common in these areas.

GRAIN, ROW-CROP, HAY AND PASTURE, DISKED/SHORT-TERM FALLOWED

The grain, row-crop, hay and pasture, disked/short-term fallowed land cover type includes managed agricultural fields that are either planted with grasses or disked or mown to maintain low vegetation stature or bare ground. Weedy plant species, such as those occurring in California annual grasslands described above, occur in these fields when they are fallow. Planted fields and pastures may support wild oats, Italian ryegrass, alfalfa (*Medicago sativa*), and others.

These fields provide habitat for wildlife species similar to that described for California annual grassland above, except that agricultural habitats are highly cultivated for specific species and regularly disturbed by farming activities. Small mammals such as valley pocket gophers, California ground squirrels, and California mice breed and forage in these fields, especially where the ground has not been recently disturbed, and they can establish burrow complexes. These small mammals provide prey for red-tailed hawks, American barn owls, grey foxes (*Urocyon cinereoargenteus*), gopher snakes, western rattlesnakes, and other predators. Birds such as Canada geese, finches, sparrows, and blackbirds will forage on seeds in these fields, and red-winged blackbirds may nest in fallow fields. However, the repeated disturbance causes these communities to change frequently, and the animal communities present will depend upon the management of individual fields.

Developed

Developed land cover types occur within city limits and in rural portions of the Program Renewal Area. The land cover types described below occur adjacent to projected Program Renewal work areas in many locations. Maintenance activities are expected to avoid the *landfill* land cover type in the Program Renewal Area, as this land cover type does not occur adjacent to any projected work areas. Thus, this land cover type is not described here (although a detailed description can be found in Section 3.3.5 of the VHP).

Santa Clara County is extensively urbanized and contains 15 cities as well as 1.9 million residents (County of Santa Clara 2024). It is a major employment center, providing more than 25 percent of all jobs in the Bay Area (Vital Signs 2024).

Urban-Suburban

Urban-suburban areas include permanent structures, paved and impermeable surfaces, and associated landscape vegetation. Landscaped areas are planted with ornamental trees, shrubs and groundcovers common to the region.

The urban-suburban areas within the Program Renewal Area serve as wildlife habitat only in a very limited capacity, and most wildlife species that occur in these areas are tolerant of frequent human disturbances. Species that use these areas include the nonnative European starling, rock pigeon, house mouse, and Norway rat, as well as the native raccoon and striped skunk. Reptiles such as western fence lizards and gopher snakes may bask on road or parking lot surfaces in order to raise their body temperature. A variety of birds, including the Anna's hummingbird, California towhee, bushtit, chestnut-backed chickadee, and California scrub-jay will nest and forage in landscape vegetation. In addition, the eaves and corners of buildings and bridges within the Program Renewal Area provide attractive nesting sites for black phoebes and cliff swallows (*Petrochelidon pyrrhonota*). Additionally, large nonnative trees provide potential nesting sites for raptors, such as Cooper's hawks.

Rural-Residential

Rural residential are similar to urban-suburban areas, but structures are present at lower densities and rural areas are typically surrounded by large areas native or nonnative habitat, or agricultural lands. Vegetation in these areas is similar to that described for urban-suburban and agricultural areas above.

Wildlife use of rural-residential areas is similar to that described for urban-suburban areas and agricultural developed areas above. However, buildings in rural-residential areas are more likely to provide potential day-roosting or night-roosting habitat for crevice-roosting bats such as the California myotis, Yuma myotis, Mexican free-tailed bat, and big brown bat due to the presence of surrounding open lands that support abundant foraging resources (i.e., invertebrate prey). American barn owls may also nest and roost in trees and structures in rural-residential areas.

Golf Courses/Urban Parks

Vegetation within golf courses/urban parks in the Program Renewal Area is similar to the landscaped vegetation present in urban-suburban areas, described above. However, these areas (especially lawns) are much more extensive within golf courses and urban parks and are often associated with water features such as fountains or artificial ponds, as well as

mature trees such as locally nonnative coast redwoods (*Sequoia sempervirens*) and nonnative London plane trees (*Platanus* x *acerifolia*).

Wildlife species that occur in golf courses and urban parks in the Program Renewal Area are similar to those present within urban-suburban areas. However, due to their larger extent, parks provide habitat for greater densities and diversities of these species. In addition, small numbers of waterbirds such as mallards are often attracted to artificial ponds, and flocks of Canada geese are often present within large lawn areas. Mature trees in these areas are more likely to provide nesting sites for common raptors, such as red-shouldered hawks, and roosting sites for common bats, such as the California myotis.

Ornamental Woodland

Ornamental woodlands may be present in urban and rural areas throughout the Program Renewal Area. These woodlands consist of nonnative trees, such as coast redwoods and eucalyptus. Understory vegetation within these areas can vary, and is typically similar surrounding community types (e.g., urban-suburban, California annual grassland, etc.).

Wildlife use of ornamental woodland areas is similar to that described for mature trees in golf courses/urban parks above. In addition, where stands of eucalyptus trees are present along migratory pathways (e.g., near the San Francisco Bay or along major stream courses on the Valley floor), migrants such as yellow-rumped warblers (*Setophaga coronata*) and ruby-crowned kinglets (*Regulus calendula*) often forage for insects in these trees.

Barren

Barren areas include aggregate facilities and mine tailings. These areas do not support vegetative communities or provide valuable habitat for wildlife species. Wildlife species occurring in adjacent developed areas may use barren areas opportunistically or move through these areas when traveling in between surrounding habitats.

Tidal and Intertidal Habitats (Non-VHP)

The Program Renewal Area extends outside of VHP-covered areas in northern Santa Clara County, into tidal and intertidal habitats associated with the San Francisco Bay. Tidal and intertidal habitats that could be impacted by Program Renewal activities are described below.

Tidal Salt Marsh

Tidal salt marsh habitat is located along the lower reaches of Program Renewal Area creeks that enter the San Francisco Bay. This habitat is influenced by tidal and salinity fluctuations, and typically consists of three zones: low marsh located below mean high water dominated by cordgrass (*Spartina* spp.), middle marsh located above mean high water dominated by pickleweed (*Salicornia* spp.), and a transitional high-marsh zone with a mixture of pickleweed and other moderately halophytic species that can tolerate occasional high tides. Halophytic plant species commonly found in the middle marsh zone and in less disturbed areas of the transitional high-marsh zone include alkali heath (*Frankenia salina*), saltgrass (*Distichlis spicata*), saltmarsh dodder (*Cuscuta salina*), spearscale (*Atriplex triangularis*), and marsh gumplant (*Grindelia stricta* var. *angustifolia*).

Within the Program Renewal Area, high marsh habitat often extends upwards along levee banks in a disturbed ecotone that contains native marsh species as well as ruderal, nonnative,

salt-tolerant species such as iceplant (*Mesembryanthemum nodiflorum*), New Zealand spinach (*Tetragonia tetragonioides*), Russian thistle (*Salsola soda*), and Australian saltbush (*Atriplex semibaccata*), as well as perennial pepperweed (*Lepidium latifolium*). Differences in transitional, pickleweed, and cordgrass salt marsh habitat types affect wildlife use and sedimentation in the sloughs and channels draining into the San Francisco Bay.

Two species of cordgrass are found in tidal marshes of the South Bay: native Pacific cordgrass (*Spartina foliosa*) and nonnative smooth cordgrass (*Spartina alterniflora*). Smooth cordgrass, which is native to the east coast of North America, easily hybridizes with Pacific cordgrass, and this can quickly lead to the widespread distribution of hybrid individuals within South Bay tidal marsh habitats. Smooth cordgrass, hybrid cordgrass, and perennial pepperweed are the predominant invasive plant species found in tidal salt marshes in the Program Renewal Area. Such invasions not only affect the food web, but these nonnative species also extend lower into channels compared to native Pacific cordgrass. This can result in the loss of channels to vegetation encroachment and subsequent sedimentation (PWA and H.T. Harvey & Associates 2006), as well as loss of mudflats that are valuable to wildlife and native estuarine aquatic organisms. The Bay-wide Invasive *Spartina* Program Renewal, funded by the California Coastal Conservancy, has been successful at minimizing the extent of hybrid *Spartina* in South Bay marshes. Small populations of hybrid *Spartina* still exist in the South Bay; however, the Invasive *Spartina* Program Renewal is continuing to monitor and control this plant Bay-wide with the ultimate goal of eradication.

Tidal marshes in the Program Renewal Area are remnants of what were formerly much larger marshes that have been filled and developed and/or converted to managed ponds. These marshes support high densities of wildlife species, including several species that are endemic to the San Francisco Bay. Based on trapping studies that have been conducted in a number of areas in the South Bay, the California vole is often the most common small mammal species found in these tidal marshes, but the state and federally endangered salt marsh harvest mouse has been recorded in pickleweed-dominated marshes in the Program Renewal Area such as in New Chicago Marsh, Nine-Par Marsh, and the Coyote Creek Salt Marsh Harvest Mouse Management Area. The salt marsh wandering shrew (*Sorex vagrans halicoetes*), a California species of special concern, has been recorded in New Chicago Marsh and other areas as well.

The state and federally endangered California Ridgway's rail is found in tidal marsh habitats (e.g., at the Palo Alto Baylands, Alviso Slough, Guadalupe Slough, and Coyote Slough) in the lower marsh zone where numerous small tidal channels are present, and this species nests in cordgrass (native and nonnative), dense stands of pickleweed, and marsh gumplant. The state endangered California black rail also nests and winters in tidal brackish and salt marshes in the Program Renewal Area in small numbers. Alameda song sparrows (*Melospiza melodia pusillula*) and Bryant's savannah sparrows (*Passerculus sandwichensis alaudinus*), both California species of special concern, also nest in tidal marshes in the Program Renewal Area. Alameda song sparrows prefer dense herbaceous vegetation wherever it occurs throughout the tidal marsh, while Bryant's savannah sparrows nest in shorter vegetation such as pickleweed and high transitional marshes in upland ecotones. Other avian species that nest in tidal marshes in the Program Renewal Area include several species of ducks, herons, and egrets (Gill 1977). Shorebirds, swallows, blackbirds, and other avian species roost and forage, often in large numbers, in tidal marsh habitats in the South Bay, but most do not breed in these areas.

TIDAL BRACKISH MARSH

Tidal brackish marsh habitat occurs in the upper intertidal reaches of sloughs and creeks draining into the San Francisco Bay in the Program Renewal Area, where vegetation is subject to tidal inundation diluted by freshwater flows from upstream. This habitat type is dominated by emergent, vascular plant species adapted to intermediate (brackish) water salinities includes short bulrushes such as alkali bulrush (*Scirpus robustus*) and saltmarsh bulrush (*Scirpus maritimus*).

Wildlife communities in tidal brackish marshes are largely similar to those in tidal salt marshes described above, with the potential for additional species that prefer freshwater marshes. Marsh wrens, red-winged blackbirds, song sparrows, and San Francisco common yellowthroats (*Geothlypis trichas sinuosa*) are common breeders in brackish marshes. Salt marsh species, such as the salt marsh harvest mouse and California Ridgway's rail, occur rarely in this habitat, but California black rails will occur here when present. Many additional tidal salt marsh and freshwater marsh-associated bird species may forage in these areas, including ducks, herons, egrets, sparrows, larger shorebirds, and swallows.

INTERTIDAL AREAS

Mudflats in the Program Renewal Area occur in intertidal areas from below mean lower low water to mean tide level. These areas consist of expanses of unvegetated mud located just beyond the lower edge of tidal wetlands, and between the low-flow channel and edge of wetlands, within the tidal reaches of channels that drain to the San Francisco Bay. This habitat often supports less than 10 percent cover of emergent vegetation, typically in the form of cordgrass and annual pickleweed (*Salicornia europaea*) that is too sparse to map as distinct salt marsh habitat. Mudflats generally are covered by shallow water during high tides and are exposed during low tides. These are dynamic depositional features, changing in extent and location depending on erosion and deposition of sediments. Narrow mudflats occur along the edges of the upper reaches of tidal sloughs, while much more extensive flats are present at the mouths of major sloughs. For example, a large expanse of mudflat habitat exists at the mouths of Alviso Slough and Guadalupe Slough, while small areas of mudflat at the upper end of Coyote Slough are surrounded by freshwater marsh.

Aquatic intertidal habitat in the Program Renewal Area is characterized by strong tidal estuarine influence and is too deep at high tides to support salt marsh and cordgrass species. Depending on tidal action, such areas can range from relatively clear to extremely turbid. These habitats are more benthic in nature than mudflats and are not exposed, even during very low tides.

Intertidal areas support high productivity due to the accumulation of detritus from tidal marshes, phytoplankton that settles in the water column, and algae and diatoms growing on mudflats (Warwick and Price 1975, Life Science 2003). Crustaceans, polychaete worms, gastropod and bivalve mollusks, and other invertebrates live on or just below the surface of the mud and feed on these resources. During daily high tides, fish school over the mudflats to feed on these invertebrates. As the tide recedes and the flats emerge, fish retreat to subtidal areas while considerable numbers of birds, primarily shorebirds, leave their high-tide roosts and feed on the exposed mudflats.

Aquatic intertidal habitats within the Program Renewal Area support a wide range of estuarine fish species, which often occur seasonally based on spawning and migration times.

Species such as the southern green sturgeon, white sturgeon, and San Francisco Bay-Delta longfin smelt can be found in the intertidal habitats of Alviso Slough and Coyote Creek (Otolith & Geochemistry Lab 2023). Additionally, these habitats are used seasonally as migration corridors by salmonids and lamprey.

Due to their high productivity, these mudflats are primarily responsible for the importance of the San Francisco Bay to West Coast shorebird populations. Other bird species, such as gulls and some dabbling ducks, forage on the exposed mudflats as well. Because benthic invertebrates often recede deeper into the mud as the tidal elevation drops, large concentrations of foraging birds typically occur right at the edge of the receding or rising tideline. Additional shorebirds, gulls, and large waders (e.g., herons and egrets) feed in smaller numbers on exposed mudflats farther inland along sloughs and channels. Smaller channels in brackish and salt marshes are favored foraging areas for the California Ridgway's rail. A number of shorebirds, gulls, terns, and ducks, as well as American white pelicans (*Pelecanus erythrorhynchos*), often use exposed mudflats as roosting or loafing areas, as do Pacific harbor seals. When the tides rise, most of these birds return to alternate roosting areas in salt ponds or other nearby habitats.

TIDAL AQUATIC

Aquatic habitat is present within the subtidal portions of tidal channels in the Program Renewal Area; these areas are subject to ebb and flow tides. No emergent vegetation typically occurs within the subtidal aquatic habitat, though this habitat will occur directly adjacent to the tidal marsh habitats.

Tidal waters support a variety of benthic invertebrates, pelagic invertebrates, and fish species. Within tidal reaches of the Program Renewal Area, the benthic assemblage includes species that are tolerant of variable salinities and temperatures such as oligochaete worms (Annelida), midge larvae (Chironomidae), and cranefly larvae (Tipulidae). Tidal waters within the Program Renewal Area support a wide range of fish species, including freshwater and estuarine species, which often occur seasonally based on spawning and migration times. Species such as the white sturgeon, topsmelt (*Atherinops affinis*), northern anchovy, starry flounder, leopard shark, Pacific staghorn sculpin (*Leptocottus armatus*), longfin smelt, and three-spined stickleback (*Gasterosteus aculeatus*) are commonly found in tidal waters within the Program Renewal Area (Otolith and Geochemistry Lab 2023, 2024). Nonnative fish species such as striped bass, Shimofuri goby (*Tridentiger bifasciatus*), American shad (*Alosa sapidissima*), threadfin shad, common carp, and yellowfin goby (*Acanthogobius flavimanus*) also occur here (Otolith and Geochemistry Lab 2023, 2024). Several tidal sloughs in the Program Renewal Area provides migratory corridors for the Pacific lamprey as well as adult and juvenile salmonids, including the CCC steelhead and Central Valley fall-run Chinook salmon.

Common waterbirds such as mallards, American coots, and gadwall (*Anas strepera*) forage within sloughs in the Program Renewal Area, while wading birds such as herons and egrets forage along the shoreline. Diving ducks and other waterbirds are typically present in low numbers in these habitats due to the narrow nature of the channels and high levels of human disturbance (where adjacent developments are present).

Invasive Species and Pathogens

Invasive and Nonnative Nuisance Species

For over two centuries, humans have brought nonnative plants and animals into the Program Renewal Area, either accidentally (e.g., as stowaways in cargo shipments) or intentionally (e.g., cultivated plants and released pets), and many of these species have now been introduced into the wild. Such species that cause harm and, once established, spread quickly from their point of introduction are often called "invasive" species. Additional nonnative species that are not necessarily "invasive" can pose issues as well and are often referred to as "nuisance" species. Lists identifying invasive species in California are available from the California Invasive Plant Council (2024) and the CDFW (2024), and a list of invasive plant species targeted by Valley Water maintenance activities is maintained and updated as needed by Valley Water.

Invasive and nonnative nuisance species can threaten the diversity and abundance of native species through predation, competition for resources, transmission of disease, parasitism, and physical or chemical alteration of habitats. Their effects on natural communities may also lead to direct effects on human activities, such as clogging waterways and water delivery systems, weakening flood protection structures, damaging crops, and diminishing sport fish populations.

As described previously, invasive plant species such as perennial pepperweed and giant reed are common in the Program Renewal Area. Additional common and widespread invasive plant species include yellow star-thistle (*Centaurea solstitialis*), eucalyptus, tree of heaven (*Ailanthus altissima*), broom species (*Ulex europaeus*, *Spartium junceum*, and *Cystisus scoparius*), Russian thistle (*Salsola tragus*), poison hemlock (*Conium maculatum*), fennel (*Foeniculum vulgare*), English ivy, pampas grass (*Cortaderia selloana*), Harding grass (*Phalaris aquatica*), Himalayan blackberry (*Rubus armeniacus*), and stinkwort (*Dittrichia graveolens*). These plants easily colonize disturbed areas or substrate that is not otherwise dominated by native plants.

Introduced animal species are also widespread in the Program Renewal Area. Several of the more common introduced/invasive wildlife and fish species present, or with a high potential to be introduced, are discussed in the paragraphs below.

As described above, many non-native fish have been introduced to the Program Renewal Area. Some nonnative species compete with or prey upon native and special-status fish. Several nonnative species occur within the Program Renewal Area as a result of historical stocking for angling purposes; stocking by anglers for bait fish; or incidental transfer through vessels, domestic animals, and other anthropogenic activities. Mosquitofish have been introduced throughout the world, including Santa Clara County, to control mosquito populations. Such introductions have been shown to have negative effects on amphibians in experimental studies, including decreased survival of larval Pacific tree frogs (Goodsell and Kats 1999) and California newts (Gamradt and Kats 1996), as well as tail injury, reduced metamorph size, and altered activity patterns of larval California red-legged frogs (Lawler et al. 1999). Piscivorous nonnative fish species may prey upon native and/or special-status fish or compete for resources, affecting growth and condition factor of natives (Swales 2006). The nonnative fish species that occur within the study area are generally more tolerant of warm water than many of the native fish species.

New Zealand mud snails (*Potamopyrgus antipodarum*), which reproduce rapidly and can crowd out the native invertebrates that aquatic wildlife depend on for survival, were first discovered in California in 2000 in the Owens River in Mono County (California Department of Fish and Game 2008d). In New Zealand, populations likely are kept in check naturally by a native parasite that is not present in North America. In the absence of such natural predators or parasites, population densities can reach nearly 1 million snails per square meter, and the species is parthenogenic (i.e., able to start a new population from only one snail) (California Department of Fish and Game 2008d). Biologists do not believe that the species can be eradicated once established (California Department of Fish and Game 2008d). This species has been recorded in the Program Renewal Area in streams discharging into the San Francisco Bay (USGS 2024).

The American bullfrog has been accidentally and intentionally introduced (e.g., for food in the 1920s by commercial frog farmers) throughout the world and is now established throughout most of the western United States, including the Program Renewal Area (California Herps 2024). The species' large size, mobility, generalized eating habits (their prey includes native amphibians as well as other aquatic and riparian vertebrates [Graber 1996]), and aggressive behavior have made bullfrogs extremely successful invaders and a threat to biodiversity (AmphibiaWeb 2024). Nonnative turtles, particularly the red-eared slider, have also been introduced in the Program Renewal Area, and these turtles compete with the native northwestern pond turtle for high-quality basking sites.

Nonnative mammal species such as feral cats, red foxes, Norway rats, and muskrats (*Ondatra zibethicus*) are known to occur in the Program Renewal Area and are significant predators of native birds. Feral pigs (*Sus scrota*) (also called wild boars), which are present outside of the most heavily urbanized portions of the Program Renewal Area, can damage natural habitats through herbivory, rooting, wallowing, and soil compaction.

Pathogens

Plant and animal pathogens, which can be spread by human activities, can also adversely affect native species and communities. *Phytophthora* is a taxonomic group of microscopic oomycetes (also known as water molds) that is known to occur throughout much of the San Francisco Bay Area and the State of California. More than 170 *Phytophthora* species have been described, and almost all are known to be pathogenic to plants. Plant diseases caused by *Phytophthora* include root rots, stem cankers, and fruit and leaf blights. *Phytophthora* is transmitted through the movement of contaminated soil and water, and some species are known to be airborne. Movement of contaminated soil, water, and plant material are primary pathways for spreading infection. Areas with woody vegetation and susceptible host plants are at greatest risk of being infested. Once introduced into native habitats, *Phytophthora* persists in soil and infected host roots and is very difficult to impossible to eradicate (Swiecki and Bernhardt 2017). Spread of contamination could result in long-term impairment of the health of native vegetation, resulting in declines in abundance of special-status plant species and sensitive communities (Swiecki 2020).

Other pathogens can adversely affect animals. Ranaviruses can cause impaired health or mortality of amphibians, turtles, and fish. These viruses are transmitted through direct contact between infected and uninfected animals, contaminated water, or predation (e.g., ingestion of infected animals). Chytrid fungus is a water-borne fungus that can impair the health of amphibians. There are approximately 1,000 chytrid species, and *Batrachochytrium*

dendrobatidis can infect the skin of amphibians (Longcore et al. 1999). Infected individuals may develop chytridiomycosis, a thickening of the skin that inhibits amphibians' ability to absorb water and electrolytes, eventually causing death (Voyles et al. 2009). Chytridiomycosis outbreaks have been linked to substantial declines in some amphibian populations (Berger et al. 1998, Fisher et al. 2009). Chytrid fungus may be spread by the dispersal of infection by translocation of zoospores by other animals or humans (including equipment and machinery) among waterbodies.

Shell disease could affect the health of northwestern pond turtles. Caused by fungal or bacterial infections, shell disease can result in lesions or irregularities in turtles' shells. This disease is known best in captive or domestic turtles, but there is concern that it could affect wild turtles, such as northwestern pond turtles (Washington Department of Fish and Wildlife 2016).

Special-Status Plant and Animal Species

CEQA requires assessment of the effects of a project on species that are protected by state, federal, or local governments as "threatened, rare, or endangered"; such species are typically described as "special-status species." For the purpose of the environmental review of the Program Renewal, special-status species of plants and animals have been defined as described below. Impacts on these species are regulated by some of the federal and state laws and regulations described under Section 3.4.2, "Regulatory Setting," above.

Special-Status Plants

For purposes of this analysis, "special-status" plants are considered plant species that meet one or more of the following criteria:

- Listed under FESA as threatened, endangered, proposed threatened, proposed endangered, or a candidate species;
- Listed under CESA as threatened, endangered, rare, or a candidate species;
- Designated by the CNPS as CRPR 1A, 1B, 2, 3, or 4; and/or
- Covered under the VHP amendment in progress.

The CNPS (2024) and CNDDB (2024) identify 97 special-status plant species as potentially occurring within one of the 34 USGS quadrangles in which the Program Renewal Area falls (for CNPS) or within Santa Clara County (for CNDDB). In addition, brittlescale (*Atriplex depressa*) was considered because it was included in the Stream Maintenance Program 2013–2023 (SMP-2) EIR, and coast rockcress (*Arabis blepharophylla*), small spikerush (*Eleocharis parvula*), and prostrate vernal pool navarretia (*Navarretia prostrata*) were added to the list of potentially occurring special-status plants due to known records of these species in the Program Renewal Area and/or in nearby areas in similar habitats. For the purpose of this assessment, all 101 special-status plants were analyzed for their potential to occur in the Program Renewal Area.

Of the 101 potentially occurring special-status plant species (including List 4 species), the vast majority were determined to be absent from the Program Renewal Area for at least one of the following reasons: (1) absence of suitable habitat types, (2) lack of specific microhabitat or edaphic requirements, (3) the elevation range of the species is outside of the range of the Program Renewal Area, and/or (4) the Program Renewal Area is outside the

species' known geographic range and/or there are no nearby extant records (*Appendix E*). All remaining special-status plants with the potential to occur in the Program Renewal Area are addressed in detail in Table 3.4-3 with the exception of CNPS List 4 species, which are only included in Table 3.4-3 if (1) the only known populations occur in the vicinity of Santa Clara County, (2) the species has been recorded by the CNPS as occurring in no more than two counties in California (i.e., it has a very limited distribution), (3) populations in the Program Renewal Area are on the periphery of the species' range or in areas where the taxon is especially uncommon or has sustained heavy losses, (4) the type locality occurs in the Program Renewal Area, or (5) populations exhibit unusual morphology or occur on unusual substrates. Three CNPS List 4 species meet the above criteria because of their restricted range: Santa Clara red ribbons (*Clarkia concinna* ssp. *automixa*), small spikerush, and Satan's goldenbush (*Isocoma menziesii* var. *diabolica*). The remaining List 4 species are listed in *Appendix E*.

Table 3.4-3 below provides detail for 32 special-status plant species for which suitable habitat, edaphic requirements, and elevation range are present in the Program Renewal Area. Of these, California seablite (*Suaeda californica*) and bent-flowered fiddleneck (*Amsinckia lunaris*) are known to occur or may occur in the Program Renewal Area; however, occurrences of these species are extremely localized, and they are not known to occur within or adjacent to proposed work areas. Thus, impacts of maintenance activities on these species are not anticipated. An additional 14 species are determined to be absent from Program Renewal work areas because they are associated with serpentine habitats, and the Program Renewal will avoid impacts within these areas. Another 16 special-status plant species could occur in Program Renewal work areas and have at least a minimal potential to be affected by maintenance activities. Of these 16 species, Congdon's tarplant (*Centromadia parryi* ssp. *congdonii*), Santa Clara red ribbons, San Francisco collinsia (*Collinsia multicolor*), western leatherwood (*Dirca occidentalis*), and Hall's bush-mallow have a low to moderate potential to occur in work areas where they may be impacted, while Anderson's manzanita (*Arctostaphylos andersonii*), alkali milk-vetch (*Astragalus tener* var. *tener*), brittlescale (*Atriplex depressa*), Point Reyes bird's beak (*Cordylanthus maritimus* ssp. *palustris*), Hospital Canyon larkspur (*Delphinium californicum* ssp. *interius*), small spikerush, Hoover's button-celery (*Eryngium aristulatum* var. *hooveri*), Satan's goldenbush, arcuate bush-mallow (*Malacothamnus arcuatus*), prostrate vernal pool navarretia (*Navarretia prostrata*), and saline clover (*Trifolium hydrophilum*) have a very low potential to occur in work areas, though occurrence cannot be eliminated.

Table 3.4-3. Special-Status Plant Species with Potential to Occur in the Program Renewal Area and Program Renewal Work Areas

Common Name (Scientific Name)	Status [1, 2, 3]	Habitat Association	Potential to Occur
Federal or State Endangered and Threatened Plant Species			
Tiburon paintbrush (*Castilleja affinis* ssp. *neglecta*)	FE, ST, CRPR 1B.2, VHP	Valley and foothill grassland (serpentinite)/ serpentine bunchgrass grassland	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Documented occurrences in the Program Renewal Area are present on Coyote Ridge between Anderson Reservoir and U.S. Highway 101. Potential habitat includes serpentine bunchgrass grasslands on the northern portion of Coyote Ridge and portions of the Santa Teresa Hills. However, Valley Water surveys for special-status plants conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Coyote ceanothus (*Ceanothus ferrisiae*)	FE, CRPR 1B.1, VHP	Chaparral, coastal scrub, valley and foothill grassland on serpentinite/ serpentine bunchgrass grassland and mixed serpentine chaparral	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Known to occur in the Anderson Reservoir area, south of Anderson Dam, and on the southern portion of Coyote Ridge between Anderson Dam and Kirby Canyon Landfill. Another population is present west of Hale Avenue and north of Llagas Road. Valley Water surveys for special-status plants conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area, away from known locations. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Santa Clara Valley dudleya (*Dudleya setchellii*)	FE, CRPR 1B.1, VHP	Cismontane woodland, valley and foothill grassland on serpentinite, rocky/ serpentine rock outcrop	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Occurs in numerous locations in the Program Renewal Area on serpentine rock outcrops, including in the Santa Teresa Hills, on Communications Hill, near Monterey Road/Senter Road, on Coyote Ridge, near Anderson Reservoir, and in the upper Llagas Creek watershed. Although many populations have been documented in the Program Renewal Area, much of the suitable habitat has not been surveyed as it occurs on private lands. Potential habitat occurs elsewhere in the Program Renewal Area on serpentine soils in the lower foothills of the Santa Cruz Mountains and the Diablo Range. However, Valley Water surveys for special-status plants conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.

Common Name (Scientific Name)	Status [1, 2, 3]	Habitat Association	Potential to Occur
Metcalf Canyon jewel-flower (*Streptanthus albidus* ssp. *albidus*)	FE, CRPR 1B.1, VHP	Valley and foothill grassland (serpentinite)/ serpentine bunchgrass grassland	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** The Program Renewal Area encompasses the majority of the Metcalf Canyon jewel-flower's range. Some uncertainty exists around the taxonomic treatment of this species and most beautiful jewel-flower. Nevertheless, this species occurs on serpentine soils on Coyote Ridge, near Anderson Reservoir, on Communications Hill, and near Llagas Road in Morgan Hill. Potentially suitable habitat is present elsewhere in the Program Renewal Area where serpentine grassland occurs. Valley Water surveys conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
California seablite (*Suaeda californica*)	FE, CRPR 1B.1	Coastal salt marshes from sea level to 49 feet	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** CNDDB records include an occurrence of eight individuals, recorded in 1971, in Harbor Marsh at the Palo Alto Baylands, within the Program Renewal Area. However, a recent review of that occurrence by the USFWS concluded that it is "likely extirpated" (USFWS 2010). All known remaining populations in the South San Francisco Bay area except one are restoration populations, and the locations of all remaining populations are well known (and outside the Program Renewal Area). Therefore, this species is absent from Program Renewal work areas.
CNPS-Listed Plant Species			
Franciscan onion (*Allium peninsulare* var. *franciscanum*)	CRPR 1B.2	Cismontane woodland, valley and foothill grassland on clay, volcanic soils, often serpentinite/oak woodland	**Unlikely to Occur in Program Renewal Area, Absent from Program Renewal Work Areas.** No populations are described as occurring in the Program Renewal Area. The closest known population occurs near Page Mill Road in Palo Alto. Suitable habitat exists in the Program Renewal Area in oak woodland habitats, such as those in the Santa Teresa and Almaden Hills. Thus, there is a possibility (albeit low) that the species occurs in woodlands or on serpentine substrates along creeks near Program Renewal work sites. However, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Bent-flowered fiddleneck (*Amsinckia lunaris*)	CRPR 1B.2	Coastal bluff scrub, cismontane woodland, valley and foothill grassland/oak woodland and chaparral	**May be Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Known to occur in Santa Clara County near Alma Bridge Road and on Kinkaid Road 1.1 miles north of Mt. Hamilton Road. No suitable habitat is present in Program Renewal work areas, as such habitat occurs in higher-elevation areas with more natural chaparral and oak woodland habitats above Lexington Reservoir, near the Almaden Hills, and near Llagas Creek. Therefore, this species is absent from Program Renewal work areas.

Common Name (Scientific Name)	Status [1, 2, 3]	Habitat Association	Potential to Occur
Anderson's manzanita (*Arctostaphylos andersonii*)	CRPR 1B.2	Broadleaved upland forest, chaparral, and North Coast coniferous forest habitats (openings) at elevations of 197 to 2,395 feet	**Unlikely to Occur in Program Renewal Area or Program Renewal Work Areas.** Not known to occur within the Program Renewal Area, but a number of documented occurrences are present in Santa Clara County above 1,000 feet in the Santa Cruz mountains. Suitable habitat for this species is present in the foothills of the Santa Cruz Mountains and Diablo Range in the eastern and western portions of the Program Renewal Area, and the species is known to occur at elevations as low as 195 feet. Thus, there is some possibility (albeit low) that individuals may occur in suitable habitat along Program Renewal streams in these foothills. However, no Program Renewal activities are projected within areas where this species is likely to occur.
Alkali milk-vetch (*Astragalus tener* var. *tener*)	CRPR 1B.2	Playas, clay soils supporting valley and foothill grasslands, and alkaline, vernal pools	**Unlikely to Occur in Program Renewal Area and Program Renewal Work Areas.** There are no recent records of this species in the far South Bay, and this species is likely absent from the Program Renewal Area. However, there is at least a low potential for this species to occur in tidal salt marshes along Coyote Slough within the Program Renewal Area, and Program Renewal activities are projected in areas providing suitable habitat.
Brittlescale (*Atriplex depressa*)	CRPR 1B.2	Chenopod scrub, meadows and seeps, playas, valley and foothill grasslands, and vernal pools on alkaline, clay soils/California annual grassland habitat on alkaline soil, seasonal wetlands	**Unlikely to Occur in Program Renewal Area and Program Renewal Work Areas.** No known occurrences exist in the Program Renewal Area. The closest known occurrence is north of Mud Slough in the Don Edwards San Francisco Bay National Wildlife Refuge in Alameda County, in alkali grasslands with eroded soils. Although no occurrences are present in the Program Renewal Area, suitable habitat is present on low-lying moist, alkaline, clay soils near the San Francisco Bay, where the species may be present, and Program Renewal activities are projected in areas providing suitable habitat.

Common Name (Scientific Name)	Status [1, 2, 3]	Habitat Association	Potential to Occur
Big-scale balsamroot (*Balsamorhiza macrolepis*)	CRPR 1B.2	Chaparral, cismontane woodland, valley and foothill grassland sometimes in serpentinite/serpentine bunchgrass grassland, mixed serpentine chaparral, and oak woodland	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Known to occur near the northern portion of Coyote Ridge and at Coyote Lake-Harvey Bear Ranch County Park. Additional suitable habitat in the Program Renewal Area is present on serpentine soils such as those along Coyote Ridge, within the Santa Teresa Hills, near Anderson Reservoir, west of Coyote Valley, on Communications Hill, and within the area of serpentine north of Alum Rock Park. However, Valley Water surveys for special-status plants conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Pink creamsacs (*Castilleja rubicundula* var. *rubicundula*)	CRPR 1B.2	Chaparral (openings), cismontane woodland, meadows and seeps, valley and foothill grassland on serpentinite/oak woodland, serpentine bunchgrass grassland	**Unlikely to Occur in Program Renewal Area, Absent from Program Renewal Work Areas.** This species was documented in 2016 above the Coyote-Alamitos Canal near the historical Bernal House, and there is a historical record from Uvas Road/Llagas Creek upstream of Chesbro Reservoir in the Program Renewal Area. Additional suitable habitat in the Program Renewal Area is present on serpentine soils such as those along Coyote Ridge, within the Santa Teresa Hills, near Anderson Reservoir, west of Coyote Valley, on Communications Hill, and within the area of serpentine north of Alum Rock Park. However, Valley Water surveys for special-status plants conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Congdon's tarplant (*Centromadia parryi* ssp. *congdonii*)	CRPR 1B.1	Valley and foothill grassland (alkaline)/ California annual grassland habitat on alkaline soils	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Known to occur in the Program Renewal Area at Shoreline Park in Mountain View, Stevens Creek Shoreline Open Space Preserve, Moffett Federal Airfield, Sunnyvale Baylands Park, grasslands in Alviso, and along Wrigley Creek in Milpitas. May occur in disturbed areas on alkaline soils and could occur along Program Renewal streams in the northern portion of the Program Renewal Area near San Francisco Bay, within disturbed California annual grasslands located near seasonally wet areas.

Common Name (Scientific Name)	Status [1, 2, 3]	Habitat Association	Potential to Occur
Mt. Hamilton thistle (*Cirsium fontinale* var. *campylon*)	CRPR 1B.2, VHP	Chaparral, cismontane woodland, and valley and foothill grassland in serpentinite seeps/ serpentine seeps	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Numerous recorded populations are present in the Program Renewal Area. This species is found near the Almaden Calero Canal, Coyote Canal, Coyote Canal Extension, Silver Creek, Metcalf Canyon, Anderson Dam spillway, Coyote Creek tributaries, springs east of Coyote Creek, drainages between Kirby Canyon landfill, and Coyote Creek golf course, drainage near Almaden Research Center, north of Calero Reservoir in a tributary to Arroyo Creek, and other locations. Suitable habitat is present elsewhere in the Program Renewal Area on mesic serpentine habitat, such as along seeps and swales throughout the foothills from Silver Creek Hills south to Morgan Hill along the Diablo Range and from Sierra Azul Open Space Preserve to Gilroy along the Santa Cruz Mountains. However, Valley Water surveys for special-status plants conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Santa Clara red ribbons (*Clarkia concinna* ssp. *automixa*)	CRPR 4.3	Chaparral, cismontane woodland/ chaparral, oak woodland; slopes near drainages	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** This species has a narrow endemic range that has been reduced to Santa Clara and Alameda Counties. Several documented occurrences in Santa Clara County are located below 1,000 feet including at Rancho San Antonio County Park, Stevens Creek County Park, Sierra Vista Open Space Preserve, and Sierra Azul Open Space Preserve. Suitable habitat exists elsewhere in the Program Renewal Area in chaparral and oak woodland habitats in the foothills of the Santa Cruz Mountains and the Diablo Range. Thus, some potential exists for the species to occur in or near Program Renewal work sites within suitable habitat.
San Francisco collinsia (*Collinsia multicolor*)	CRPR 1B.2	Closed-cone coniferous forest, coastal scrub, sometimes serpentinite	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Within Santa Clara County, a known occurrence of this species is located within the Program Renewal Area on the shoreline of Anderson Reservoir, and this species was present, at least historically, in Almaden/Quicksilver County Park outside of the Program Renewal Area. Although Program Renewal activities will avoid serpentine habitat areas, the majority of occurrences are not located on serpentine soils. Thus, some potential exists for this species to occur in or near Program Renewal work sites within suitable habitat.
Point Reyes bird's beak (*Cordylanthus maritimus* ssp. *palustris*)	CRPR 1B.2	Salt marshes, particularly at salt pan edges with occasional tidal inundation	**Unlikely to Occur in Program Renewal Area and Program Renewal Work Areas.** There are no recent records of this species in the far South Bay, and this species is likely absent from the Program Renewal Area. However, there is at least a low potential for this species to occur in tidal salt marshes along Coyote Slough within the Program Renewal Area, and Program Renewal activities are projected in areas providing suitable habitat.

Common Name (Scientific Name)	Status [1, 2, 3]	Habitat Association	Potential to Occur
Hospital Canyon larkspur (*Delphinium californicum* ssp. *interius*)	CRPR 1B.2	Found in chaparral and cismontane woodland habitats at elevations of approximately 760–3,615 feet	**May be Present in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** The species inhabits a small endemic range that covers the mid and upper elevations of the inner Coast Ranges in the San Francisco Bay Area south towards Mount Hamilton. No known occurrences of this species are present in the Program Renewal Area; however, potential habitat occurs toward the upper elevations of the Program Renewal Area in the Diablo Range, in wet, boggy meadows, canyons, and chaparral openings. Due to the lack of known occurrences in the Program Renewal Area, this species is unlikely to occur along Program Renewal streams.
Western leatherwood (*Dirca occidentalis*)	CRPR 1B.2	Mesic broadleaved upland forest, closed-cone coniferous forest, chaparral, cismontane woodland, North Coast coniferous forest, riparian forest, and riparian woodland habitats at elevations of approximately 164–1,296 feet	**May be Present in Program Renewal Area and in Program Renewal Work Areas.** Known to occur in the northeastern portion of the Program Renewal Area at Rancho San Antonio County Park and Foothills Nature Preserve. Suitable habitat occurs in the Program Renewal Area in the foothills of the Santa Cruz Mountains from Los Altos Hills to Cupertino. Some potential exists for the species to occur in or near Program Renewal work sites within suitable habitat.
Small spikerush (*Eleocharis parvula*)	CRPR 4.3	Coastal salt marsh	**Present in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** An occurrence of this species is known from brackish salt marsh habitat in the Alviso area. Suitable habitat for this species is present in salt marshes within the Program Renewal Area; however, due to this species' limited distribution in Santa Clara County, the likelihood of occurrence is relatively low.
Hoover's button-celery (*Eryngium aristulatum* var. *hooveri*)	CRPR 1B.1	Vernal pools/California annual grassland habitat on alkaline soil, seasonal wetland	**Present in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** Several historical occurrences of the species have been reported in the Program Renewal Area. However, all occurrences in the Program Renewal Area vicinity have been extirpated by development, except one located in the vicinity of San Felipe Lake along Highway 152 east of Gilroy (where no Program Renewal activities are projected). Suitable habitat may be present in alkaline depressions or roadside ditches along San Francisco Bay or in the vicinity of Gilroy and San Martin; however, due to the species' limited distribution in the Program Renewal Area, the likelihood of occurrence is relatively low.
Common Name (Scientific Name)	**Status [1, 2, 3]**	**Habitat Association**	**Potential to Occur**

Fragrant fritillary (*Fritillaria liliacea*)	CRPR 1B.2, VHP	Cismontane woodland, coastal prairie, coastal scrub, valley and foothill grassland, often in serpentinite/oak woodland, serpentine bunchgrass grassland	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Known to occur on Coyote Ridge, south of Anderson Dam, at Coyote Valley Open Space Preserve, and at Almaden Quicksilver County Park, and was formerly known to occur at Stanford University. Additional suitable habitat occurs on serpentine soils in the Program Renewal Area, such as at Anderson and Calero Reservoirs, west of Coyote Valley, in the Santa Teresa Hills, on Communications Hill, and north of Alum Rock Park. Valley Water surveys for special-status plants conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Loma Prieta hoita (*Hoita strobilina*)	CRPR 1B.1, VHP	Chaparral, cismontane woodland, riparian woodland, usually serpentinite/mesic mixed serpentine chaparral, serpentine seeps	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Numerous records are present in the Program Renewal Area on serpentine soils, predominantly in the Santa Cruz mountains from Saratoga to Gilroy, but also in the Diablo Range near Coyote Ridge. Suitable habitat is present in the Program Renewal Area in riparian areas, particularly in the mesic-serpentine influenced soils of the Santa Cruz mountains. Known occurrences along several creeks in the Program Renewal Area suggest the possibility that this species may occur within Program Renewal work areas. However, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Satan's goldenbush (*Isocoma menziesii* var. *diabolica*)	CRPR 4.2	Cismontane woodland/oak woodland	**Present in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** The species has only been documented in Santa Clara, San Benito, and Monterey Counties. It occurs in the Program Renewal Area in the foothills of the Diablo Range in eastern San Jose from Alum Rock Park north to Ed Levin County Park. Suitable habitat is present in the foothills of the Diablo Range where oak woodland habitat occurs in the Santa Teresa Hills, the Almaden Hills, near Anderson Reservoir, and along Coyote Ridge. However, Program Renewal work activities are not projected to occur into foothill areas where this species is known to occur; rather, work activities will occur downstream within urban areas. Although some potential exists for the species to occur in suitable habitat near Program Renewal work areas, it is unlikely to occur within the work areas themselves.

Common Name (Scientific Name)	Status [1, 2, 3]	Habitat Association	Potential to Occur
Woolly-headed lessingia (*Lessingia hololeuca*)	CRPR 3	Clay and serpentinite soils in broadleaved upland forest, coastal scrub, lower montane coniferous forest, and valley and foothill grassland habitats at elevations of approximately 49–1,000 feet	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Three records exist in the Program Renewal Area: one in the foothills west of Los Gatos, one in Sierra Azul Open Space Preserve, one in an area north of Gilroy. Suitable habitat elsewhere in the Program Renewal Area is present on serpentine soils in the foothills of the Santa Cruz Mountains. Valley Water surveys for special-status plants conducted for prior Program Renewal activities and other purposes have not detected this species along creeks in the Program Renewal Area. In addition, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Smooth lessingia (*Lessingia micradenia* var. *glabrata*)	CRPR 1B.2, VHP	Chaparral, cismontane woodland - on serpentinite, often roadsides/mixed serpentine chaparral and oak woodland	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** In the Program Renewal Area, numerous records are present in the foothills of the Santa Cruz Mountains and the Diablo Range in the central and southern portions of Santa Clara County. Suitable habitat is present on rocky slopes and along roadsides in serpentine-derived soils throughout these areas. The species could occur on serpentine substrates along creeks near Program Renewal work locations. However, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Arcuate bush-mallow (*Malacothamnus arcuatus*)	CRPR 1B.2	Chaparral and cismontane woodland from 50–1,165 feet in elevation	**Present in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** Known to occur at Rancho San Antonio Open Space Preserve and was historically present at a number of additional locations in Santa Clara County including in the Santa Cruz Mountains, along Coyote Ridge, in Palo Alto, and along Alviso Slough. The species could occur in suitable habitat along Program Renewal streams in these areas; however, due to its limited distribution, the likelihood of occurrence is extremely low.
Hall's bush-mallow (*Malacothamnus hallii*)	CRPR 1B.2, VHP*	Chaparral, coastal scrub/chaparral	**Present in the Program Renewal Area, May be Present in Program Renewal Work Areas.** Numerous records of the species exist in the Program Renewal Area in the Santa Teresa Hills, along Coyote Ridge, at Calero County Park and at Tilton Ranch in Morgan Hill. Additional suitable habitat is present in the foothills of the Santa Cruz Mountains and the Diablo Range. Some potential exists for the species to occur in or near Program Renewal work sites within suitable habitat.

Common Name (Scientific Name)	Status [1, 2, 3]	Habitat Association	Potential to Occur
Woodland woollythreads (*Monolopia gracilens*)	CRPR 1B.2, VHP*	Grasslands or open areas in chaparral, coastal scrub, cismontane woodland, and North Coast coniferous forest on serpentinite	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Occurs in the Program Renewal Area at Foothills Open Space Preserve, at Hidden Villa, at Rancho San Antonio Open Space Preserve, in the Santa Teresa Hills, along Metcalf Road, at Sierra Azul Open Space Preserve, at Almaden Quicksilver County Park, along Coyote Ridge, at Rancho San Vicente Open Space Preserve, above Anderson Lake Dam, at Coyote Valley Open Space Preserve, at Sierra Vista Open Space Preserve, and above Pacheco Reservoir. The species could occur on serpentinite substrates along creeks near Program Renewal work locations. However, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Prostrate vernal pool navarretia (*Navarretia prostrata*)	CNPS 1B.2	Vernal pools, seeps, valley and foothill grassland	**Present in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** Present within the Program Renewal Area at San Felipe Lake, though no Program Renewal activities are projected to occur there. Unlikely to occur within Program Renewal work areas due to the species' limited distribution and a lack of suitable habitat.
Most beautiful jewel-flower (*Streptanthus albidus* ssp. *peramoenus*)	CRPR 1B.2, VHP	Chaparral, cismontane woodland, valley and foothill grassland in serpentinite/ serpentine bunchgrass grassland, mixed serpentine chaparral	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Occurs in the Program Renewal Area at Rancho San Vicente Open Space Preserve, near Rancho Canada del Oro Open Space Preserve, along Coyote Ridge, and additional historical occurrences are present in the Santa Cruz Mountain foothills from Los Gatos to Morgan Hill. May occur in suitable habitat along Program Renewal streams in the Program Renewal Area. However, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Common Name (Scientific Name)	**Status [1, 2, 3]**	**Habitat Association**	**Potential to Occur**
Saline clover (*Trifolium hydrophilum*)	CRPR 1B.2	Mesic, alkaline, or saline sites in valley and foothill grassland habitat, in vernal pool habitat, or in marshes and swamps at elevations from 0–984 feet; occurs in	**May be Present in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** No known occurrences in the Program Renewal Area, but suitable habitat may be present. The nearest documented occurrences are between Millers Canal and the Pajaro River off Highway 125 near the San Benito and Santa Clara County line, where no Program Renewal activities are projected to occur. Suitable habitat in the Program Renewal Area includes mesic-alkaline soils in pools, marshes, and swamps, as well as in grasslands, such as those near Alviso and the Pajaro River. Unlikely to occur within Program Renewal work areas due to the lack of known occurrences in the Program Renewal Area.

		both coastal and inland marshes (Jepson Project 2024)	

[1] Federal and State Endangered and Threatened Status Definitions:

Federal

FE Endangered under FESA

FT Threatened under FESA

State

ST Threatened under CESA

[2] CNPS List CRPRs:

1A Plants considered extinct.

1B Plants rare, threatened, or endangered in California and elsewhere.

3 Plants about which more information is needed - review list.

4 Plants of limited distribution-watch list.

The CRPRs are further described by the following threat code extensions:

.1—seriously endangered in California.

.2—fairly endangered in California.

.3—not very endangered in California.

[3] VHP = Species covered under the VHP; VHP* = Species proposed for coverage under the VHP amendment

Sources: CNDDB 2024, CNPS 2024, and Calflora 2024

Special-Status Animals

For purposes of this analysis, "special-status" animals are considered animal species that meet one or more of the following criteria:

- Listed under FESA as threatened, endangered, proposed threatened, proposed endangered, or a candidate species;
- Listed under CESA as threatened, endangered, or a candidate species;
- Designated by the CDFW as a California species of special concern;
- Designated by the California Fish and Game Code as a fully protected species (fully protected birds are provided in Section 3511, mammals in Section 4700, reptiles and amphibians in Section 5050, and fish in Section 5515);.
- Covered under the VHP amendment in progress; and/or
- Protected by the Marine Mammal Protection Act.

The legal status and likelihood of occurrence within the Program Renewal Area of special-status animal species known to occur or potentially occurring in the surrounding region are presented in Table 3.4-4.

Several special-status animal species historically occurred in the Program Renewal Area, or have been recorded in Santa Clara County, but are not expected to be present in the Program Renewal Area currently. The special-status animal species discussed below are not included in Table 3.4-4 or discussed in this assessment further.

The western ridged mussel (*Gonidea angulata*) occurs in small populations in rivers. Recent re-surveys of historically occupied sites in central and southern California did not detect individuals, though some sites in far northern California were still occupied (Xerces Society for Invertebrate Conservation 2020). That survey concluded that the mussel is "possibly extinct" in the northwestern and western portions of Santa Clara County, while extant in the North Bay and other portions of northern California.

Although the western bumble bee (*Bombus occidentalis*) was historically found throughout much of California, it has been extirpated from much of its former range, and there are no recent records from Santa Clara County or nearby areas (CDFW 2019, Bumble Bee Watch 2024, CNDDB 2024, iNaturalist 2024). Therefore, this species is absent from the Program Renewal Area.

The CCC coho salmon (*Oncorhynchus kisutch*) was anecdotally reported in Coyote Creek, and possibly in the Guadalupe River and Los Gatos Creek (Skinner 1962 as cited in Leidy et al. 2005). However, it is unclear whether the species was ever actually present, as the life history of coho salmon is not conducive to its existence in South San Francisco Bay streams under either historical or current conditions. If it was ever present, it has been extirpated from these areas (Leidy 2005, Spence et al. 2005).

The range of the western spadefoot toad (*Spea hammondii*) is not known to include Santa Clara County, even historically, as there are no known occurrences in Santa Clara County. Nearest occurrences in San Benito County along the southern edge of Hollister are more than 8.5 miles from the Program Renewal Area, and unsuitable land uses and the Pajaro River are a biogeographic barrier to dispersal into Santa Clara County. Nearest occurrences

in eastern Alameda County are more than 11 miles from the Program Renewal Area, and no suitable habitat is present in intervening areas or nearby portions of Santa Clara County.

The silvery legless lizard (*Anniella pulchra pulchra*) was historically recorded in the northern San Jose portion of the Program Renewal Area, but no recent records exist. This species has been displaced by development or disturbed by agriculture in much of the Program Renewal Area, and a suite of other factors (e.g., off-road vehicle activity, erosion, livestock grazing, and the introduction of nonnative plant species) has altered remaining habitat to the extent that the species is no longer expected to occur in the Program Renewal Area.

The southern edge of the Alameda whipsnake's (*Masticophis lateralis euryxanthus*) range is located at the northern edge of eastern Santa Clara County within the San Francisco Public Utilities Commission-owned portion of the Alameda Creek Watershed. This subspecies may intergrade with the chaparral whipsnake (*M. l. lateralis*) at the southern edge of its range, making identification difficult. The most recent extant CNDDB occurrences (from 2014 to 2017) are located east of Calaveras Reservoir outside the Program Renewal Area (CNDDB 2024). Thus, this species is determined to be absent from the Program Renewal Area.

The willow flycatcher (*Empidonax traillii*) formerly nested commonly in riparian habitats on the Santa Clara Valley floor, but local populations were extirpated by the late 1960s. This species still occurs as an uncommon migrant in the Program Renewal Area, moving between wintering areas in Mexico and breeding areas to the north (Unitt 1987, Hunter et al. 2005). However, migrant willow flycatchers occurring in the Program Renewal Area are likely from breeding populations outside the state, and, thus, would not be individuals from the state-listed California population or the federally listed *extimus* subspecies that nests in riparian habitat in southern California (Unitt 1987).

The yellow rail (*Coturnicops noveboracensis*), a California species of special concern, is rare in California but was historically known to overwinter in coastal tidal marshes in the greater San Francisco Bay region. The species could occur in tidal marshes in the Program Renewal Area, though there are very few recent records, and it likely occurs in very low numbers and irregularly, if at all.

Several bird species that are considered California species of special concern only when nesting occurs in the Program Renewal Area as nonbreeding transients, foragers, or migrants, and have never been recorded breeding in or very close to the Program Renewal Area. These include the Barrow's goldeneye (*Bucephala islandica*), common loon (*Gavia immer*), American white pelican, black swift (*Cypseloides niger*), black tern (*Chlidonias niger*), and yellow-headed blackbird (*Xanthocephalus xanthocephalus*). Because they are only considered species of special concern when nesting, they are not special-status species when they occur as nonbreeding visitors to the Program Renewal Area. Thus, these species are not discussed further in this assessment, and they are not included in Table 3.4-4.

Three bird species that are state or federally listed, and consequently are considered special-status species year-round, also occasionally occur in the Program Renewal Area as nonbreeding migrants, transients, or foragers, but they are not known or expected to breed, to occur regularly, or to occur in large numbers in the Program Renewal Area. These are the state and federally endangered California condor and California least tern, and the state threatened bank swallow. Although they occur in the Program Renewal Area only infrequently and/or in small numbers, they are discussed in further detail in Table 3.4-4 below because they are considered special-status species year-round. The willow flycatcher

(discussed above) would be treated similarly to these species if the individuals that occur as migrants in the Program Renewal Area were from the state-listed California breeding populations; however, the probability that any California-breeding willow flycatchers migrate through the Program Renewal Area is extremely low given the scarcity of the species as a breeder in California (as opposed to areas farther north) north of the Program Renewal Area.

Additional special-status animal species are addressed in greater detail in Table 3.4-4 below because they (1) are known to breed or could breed in the Program Renewal Area, (2) occur fairly commonly as nonbreeders in the Program Renewal Area (and thus could be substantially affected by activities that occur under the Program Renewal), (3) are described in the VHP as potentially occurring in the Program Renewal Area, and/or (4) are of particular concern to regulatory agencies. These are the Bay checkerspot butterfly, large marble butterfly, monarch butterfly, Crotch's bumble bee, CCC and SCCC steelhead, Central Valley fall-run Chinook salmon, Pacific lamprey, Sacramento hitch, southern coastal roach, Monterey hitch, riffle sculpin, southern green sturgeon, white sturgeon, San Francisco Bay-Delta longfin smelt, Santa Cruz black salamander (*Aneides niger*), California giant salamander, California tiger salamander, California red-legged frog, foothill yellow-legged frog, San Francisco garter snake (*Thamnophis sirtalis tetrataenia*), northwestern pond turtle, coast horned lizard (*Phrynosoma blainvillii*), redhead (*Aythya americana*), least bittern (*Botaurus exilis*), Vaux's swift (*Chaetura vauxi*), western snowy plover, California Ridgway's rail, California black rail, black skimmer (*Rynchops niger*), northern harrier, Swainson's hawk, white-tailed kite, golden eagle, bald eagle, long-eared owl (*Asio otus*), short-eared owl (*Asio flammeus*), burrowing owl, olive-sided flycatcher (*Contopus cooperi*), loggerhead shrike, purple martin (*Progne subis*), least Bell's vireo, yellow-breasted chat (*Icteria virens*), Alameda song sparrow, grasshopper sparrow, Bryant's savannah sparrow, tricolored blackbird, yellow warbler, San Francisco common yellowthroat, salt marsh harvest mouse, salt marsh wandering shrew, San Francisco dusky-footed woodrat, pallid bat, Townsend's big-eared bat (*Corynorhinus townsendii*), western red bat (*Lasiurus blossevillii*), American badger, ringtail, Central Coast Evolutionarily Significant Unit of the mountain lion, San Joaquin kit fox, and Pacific harbor seal.

Table 3.4-4. Special-Status Wildlife Species with Potential to Occur in the Program Renewal Area and in Program Renewal Work Areas

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Federal or State Endangered, Threatened, or Candidate Species			
Bay checkerspot butterfly (*Euphydryas editha bayensis*)	FT, VHP	Native grasslands on serpentine soils. Larval host plants are *Plantago erecta* and/or *Castilleja* sp.	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** Occurs within the Program Renewal Area in serpentine bunchgrass grasslands and serpentine rock outcrop/barrens on the east side of the Santa Clara Valley from Coyote Ridge south to Harvey Bear Ranch, and on the west side of the Santa Clara Valley from the Santa Teresa Hills south to San Martin (Figure 3.4-2). However, Program Renewal activities will avoid serpentine habitat areas. Therefore, this species is absent from Program Renewal work areas.
Large marble butterfly (*Euchloe ausonides ausonides*)	FPE, VHP*	A variety of habitats including grasslands, open meadows, and streams. Larval host plants are in the mustard family (Brassicaceae).	**Present in the Program Renewal Area and Program Renewal Work Areas.** May occur widely, though possibly only scarcely in many areas, as a resident in the Program Renewal Area. Mustards are widespread along streams and in grasslands in the Program Renewal Area and provide suitable larval host plants. This species likely occurs in grasslands and along streams throughout much of the Program Renewal Area in low numbers. Occurrence along urban streams is expected to be much less frequent compared to streams located in more natural areas. This species also occurs in upland areas adjacent to tidal marshes and waters, where mustards are present.

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Monarch butterfly (*Danaus plexippus*)	FC, VHP*	Larval host plants are typically milkweeds (*Asclepias* spp.); nectars on a variety of flowering plants	**Present in Program Renewal Area and Program Renewal Work Areas.** Occurs widely as an uncommon migrant, nectaring on flowering plants. Narrow-leaf milkweed (*Asclepias fascicularis*) is present in scattered patches throughout the Program Renewal Area, with more substantial patches present along West Little Llagas Creek in Morgan Hill (west of Hale Avenue) and along Llagas Creek in Gilroy (from approximately State Route 152 north to Buena Vista Avenue). However, close examination of approximately 480 clusters of milkweed plants along Coyote Creek between Anderson Dam and the Coyote Creek Golf Course area (including the Ogier Ponds) during three days in May and June 2022 detected only two monarch butterfly larvae; inspection of 100 plants along the rim of Anderson Reservoir on July 30, 2022, detected no monarch eggs, larvae, or pupae (S. Rottenborn, personal observation). Thus, although monarch butterflies breed in the Program Renewal Area, they do so in low numbers, breeding much less commonly (at least along streams) than is indicated by the abundance of their host plants. Breeding occurs both in natural areas (on narrow-leaf milkweed) and in suburban areas (where monarchs have been documented breeding on milkweed, particularly nonnative tropical milkweed [*Asclepias curassavica*], in landscaped areas). Some monarchs have recently overwintered in the Palo Alto/Mountain View area, even breeding through the winter, though not in large roosting aggregations. No large wintering aggregations occur in Santa Clara County.
Crotch's bumble bee (*Bombus crotchii*)	SC, VHP*	Open grassland and scrub habitats	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Concern over possible population declines and range contractions led CDFW (2019) to designate this species as a candidate for listing under CESA. However, since 2019, there have been documented occurrences of approximately 100 individuals from nearly 20 locations in Santa Clara County (Bumble Bee Watch 2024, iNaturalist 2024, S. Lockwood and S. Rottenborn, pers. obs.), indicating that the species is still extant, and fairly widespread (albeit in low numbers in most locations) in the county. This species likely occurs in grassland and scrub habitat throughout much of the Program Renewal Area in low numbers, and it may occur along streams located within or near extensive grasslands or scrub. Occurrence along urban streams is expected to be much less frequent.
Southern distinct population segment (DPS) of North American green sturgeon	FT	Spawns in large river systems such as the Sacramento River; forages in nearshore	**May be Present in Program Renewal Area as Nonbreeder, Likely Absent from Program Renewal Work Areas.** Known to occur in the San Francisco Bay, but apparently occurs in the South Bay very rarely as a non-spawing visitor and does not spawn in the South Bay. May occur in the tidal reaches of lower San Francisquito Creek, lower Permanente Creek/Mountain View Slough, lower Stevens

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
(*Acipenser medirostris*)		oceanic waters, bays, and estuaries.	Creek/Williamson Slough, Alviso Slough, Guadalupe Slough, Moffett Channel, Lower Calabazas Creek, lower San Tomas Aquino Creek, and/or Coyote Slough within the Program Renewal Area, albeit infrequently and in low numbers, if at all. Likely occurs only irregularly and in low numbers in the Program Renewal Area because of the very limited abundance of the species in the vicinity and limited extent of Program Renewal activities proposed in tidal habitats.
White sturgeon (*Acipenser transmontanus*)	SC	Spawns in large river systems such as the Sacramento River; forages in nearshore oceanic waters, bays, and estuaries.	**Present in Program Renewal Area and Program Renewal Work Areas**. White sturgeon occur in lower San Francisquito Creek, lower Stevens Creek/Williamson Slough, Guadalupe Slough, the Moffett Channel, lower Calabazas Creek, lower San Tomas Aquino Creek, Alviso Slough, and the tidally influenced portion of Coyote Creek in the Program Renewal Area (Otolith Geochemistry & Fish Ecology Laboratory 2021).
San Francisco Bay-Delta longfin smelt (*Spirinchus thaleichthys*)	FE, ST	Spawns and forages in low-salinity habitats in the intertidal portions of Coyote and Alviso Sloughs within the South Bay.	**Present in Program Renewal Area and Program Renewal Work Areas.** Occurs in the South Bay year-round (Wernette 2000) and has been collected in Coyote and Alviso Sloughs from October through May (Hobbs et al. 2012, Otolith Geochemistry & Fish Ecology Laboratory 2021, 2022, 2023) as well as in the Island Ponds between Coyote Slough and Mud Slough (Hobbs 2011). Adult longfin smelt have been observed spawning or preparing to spawn in restored salt ponds and tidal sloughs within the Program Renewal Area (Lewis et al. 2020, Barros et al. 2021, Otolith Geochemistry & Fish Ecology Laboratory 2021, 2022, 2023). To date, longfin smelt have only been documented in tidal areas and have not been documented in nontidal areas upstream. May be present in the tidal reaches of any sloughs in the South Bay.
Central California Coast DPS steelhead (*Oncorhynchus mykiss*)	FT	Cool streams with suitable spawning habitat and conditions allowing migration between spawning and marine habitats.	**Present in Program Renewal Area and Program Renewal Work Areas.** Known to occur in the Program Renewal Area in a number of streams flowing into San Francisco Bay, including the Guadalupe River, Guadalupe Creek, Alamitos Creek, Los Gatos Creek, Calero Creek, Coyote Creek, Upper Penitencia Creek, Arroyo Aguague, Los Trancos Creek, Stevens Creek, and San Francisquito Creek. Juveniles present year-round in upper reaches of streams. Likely present in all accessible reaches of these streams in the Program Renewal Area during migration. Also present in the lower, tidal reaches of Alviso Slough, Coyote Slough, Stevens Creek, and San Francisquito Creek, as well as in estuarine habitats of the South Bay, during migration.
South-Central California Coast DPS steelhead	FT	Cool streams with suitable spawning habitat and conditions allowing migration	**Present.** Known to occur in the Program Renewal Area in the Pajaro River and its tributaries, including Pescadero Creek, Llagas Creek, Uvas/Carnadero Creek, Little Arthur Creek, Bodfish Creek, Tar Creek, Pacheco Creek, Cedar Creek, and South Fork

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
(Oncorhynchus mykiss)		between spawning and marine habitats.	Pacheco Creek (Leidy 2007, Casagrande 2010). Likely present in all accessible reaches of these streams in the Program Renewal Area during migration.
California tiger salamander (*Ambystoma californiense*)	FT, ST, VHP	Breeds in seasonal and perennial pools/ponds in grasslands or open woodlands; spends most time in subterranean refugia such as small mammal burrows or deep rock crevices	**Present in Program Renewal Area and Program Renewal Work Areas.** Historically may have occurred throughout the Program Renewal Area; however, populations located along the Valley floor have been extirpated because of habitat alteration, and the species is absent from most of the Valley floor. Recent occurrences are scattered on the periphery of the Program Renewal Area in the foothills of the Santa Cruz Mountains from Santa Teresa County Park to Gilroy, and in the foothills of the Diablo Range from Coyote Ridge to Gilroy (Figure 3.4-3).
California red-legged frog (*Rana draytonii*)	FT, CSSC, VHP	Streams, freshwater pools, and ponds with emergent or overhanging vegetation	**Present in Program Renewal Area and Program Renewal Work Areas.** This species has been extirpated from much of the Valley floor, and red-legged frogs are not expected to occur throughout most of the developed portions of the Program Renewal Area, even in streams and ponds. However, red-legged frogs are known or expected to occur in a number of locations on the periphery of the Program Renewal Area (i.e., in or near the upper, less developed reaches of streams in the Program Renewal Area) in the foothills of the Santa Cruz Mountains from Sierra Azul Open Space Preserve south to Gilroy, and in the foothills of the Diablo Range from Alum Rock Park to Gilroy (Figure 3.4-4).
Foothill yellow-legged frog (*Rana boylii*)	SE, FT, VHP	Partially shaded, shallow, perennial streams and riffles with a rocky substrate. Also, occasionally occurs in intermittent streams and small in-stream impoundments. Occurs in a variety of habitats in coast ranges	**Present in Program Renewal Area, Absent from Program Renewal Work Areas.** In the Program Renewal Area, this species has disappeared from streams below major reservoirs. Populations of foothill yellow-legged frogs are still present on the margins of the Program Renewal Area along the upper reaches of some streams above major reservoirs, including perennial and intermittent streams (H. T. Harvey & Associates 1999c). However, this species is absent from areas where Program Renewal work will occur (Figure 3.4-5).

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Northwestern pond turtle (*Actinemys marmorata*)	FPT, CSSC, VHP	Permanent or intermittent/seasonal water in a variety of habitats	**Present in Program Renewal Area and Program Renewal Work Areas.** Occurs in a number of aquatic habitats in the Program Renewal Area, including a number of perennial and intermittent creeks, rivers, lakes, and ponds (CNDDB 2024, H. T. Harvey & Associates 2012a) (Figure 3.4-6). Breeding populations of northwestern pond turtles have been extirpated from many urbanized areas in the region. However, individuals of this long-lived species still occur in perennial urban streams and ponds in the Program Renewal Area. Occurrence is more limited in intermittent creek systems. Potentially suitable nesting habitat for northwestern pond turtles is present in grassland areas adjacent to suitable streams and ponds in the Program Renewal Area.
San Francisco garter snake (*Thamnophis sirtalis tetrataenia*)	FE, SE, SP	Freshwater marshes, ponds, and slow-moving streams along the coast	**Absent from Program Renewal Area and Program Renewal Work Areas.** Garter snakes in the northwestern part of the Program Renewal Area (i.e., in the Palo Alto/Stanford area) fall within the intergrade zone between the San Francisco garter snake and the red-sided garter snake (*Thamnophis sirtalis infernalis*) (Barry 1994). The intergrade populations do not belong exclusively to either subspecies; thus, true San Francisco garter snakes do not occur in the Program Renewal Area.
Bank swallow (*Riparia riparia*)	ST	Colonial nester on vertical banks or cliffs with fine-textured soils near water	**Present as Nonbreeder in Program Renewal Area and Program Renewal Work Areas.** No recent breeding records from Santa Clara County. Occurs in the Program Renewal Area only as a scarce migrant.
California condor (*Gymnogyps californianus*)	FE, SE, SP	Nests in caves in steep, isolated cliffs or cavities in mature redwood trees. Forages over grasslands, open woodlands, and along coastal beaches	**Present as Nonbreeder in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** Historically present in the Program Renewal Area as a nonbreeder, but currently known to occur in the Program Renewal Area only as an infrequent dispersant (usually flying very high over the area). There have been several observations of birds flying high over the Diablo Range foothills, the Pacheco Creek area, and the Saratoga/Los Gatos area (Cornell Lab of Ornithology 2024), demonstrating that reintroduced individuals from Pinnacles National Monument in San Benito County occasionally range as far north as the Program Renewal Area (and may do so increasingly in the future if the reintroduced population expands). However, such individuals are unlikely to occur in the low-elevation areas where Program Renewal activities will occur.
Bald eagle (*Haliaeetus leucocephalus*)	SE, SP	Occurs mainly along seacoasts, rivers, and lakes; nests in tall trees or in cliffs,	**Present in Program Renewal Area and Program Renewal Work Areas.** Numbers of bald eagles have been increasing in the Program Renewal Area in recent years, and at least 10 pairs currently nest here. This species has recently nested in the Program Renewal Area (i.e., below 1,000 feet in elevation) at Coyote Reservoir, Anderson

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
		occasionally on electrical towers; feeds mostly on fish and waterfowl	Reservoir, Lexington Reservoir, Calero Reservoir, San Felipe Lake, the Ogier Ponds, Pacheco Creek, Curtner Elementary School in Milpitas, Felt Lake, and other locations. Small numbers of nonbreeding bald eagles also forage throughout the Program Renewal Area, primarily at large reservoirs, during winter and migration.
Swainson's hawk (*Buteo swainsoni*)	ST, VHP*	Nests in trees surrounded by extensive marshland or agricultural foraging habitat	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Two pairs of Swainson's hawks have been confirmed nesting in Santa Clara County in recent years. Each year from 2013 to 2020, a pair of Swainson's hawks nested near Coyote Creek in northern Coyote Valley, providing the first County nesting record since the 1890s (Phillips et al. 2014). The only other modern record of nesting Swainson's hawk in Santa Clara County has been along State Route 152 southeast of Gilroy, from 2018 through 2023 (Klein et al. 2022). This species' population/range expansion has been more pronounced in San Benito County to the south in comparison to Santa Clara County. Additional nesting pairs are expected to occur in the Program Renewal Area in future years as the species' population continues to increase. This species could therefore also nest in the Program Renewal Area in the future, and it could forage along Program Renewal streams. Small numbers of nonbreeding individuals forage in open habitats elsewhere in the Program Renewal Area during migration.
California Ridgway's rail (*Rallus obsoletus obsoletus*)	FE, SE, SP	Tidal salt marsh dominated by cordgrass and pickleweed; occasionally occurs in brackish marshes as well	**Present in Program Renewal Area and Program Renewal Work Areas.** Suitable nesting habitat is present in the Program Renewal Area in salt marsh habitat along the lowermost tidal reaches of creeks that flow into the San Francisco Bay (Liu et al. 2012) (Figure 3.4-7). On very rare occasions, nonbreeding individuals wander up tidal sloughs (e.g., in tidal brackish/freshwater marsh habitats along Alviso Slough); however, all suitable breeding habitat for Ridgway's rails occurs in saline and brackish tidal marshes.
California black rail (*Laterallus jamaicensis coturniculus*)	ST, SP	Breeds in fresh, brackish, and tidal salt marsh near the edge of San Francisco Bay	**Present in Program Renewal Area and Program Renewal Work Areas.** Until recently, black rails were known to occur in the South Bay primarily as scarce winter visitors. However, since 2012, this species has been recorded during the breeding season in Santa Clara County tidal marshes, and nesting has been documented at Alviso Marina County Park. Broader tidal marshes along streams in the Program Renewal Area may support nesting black rails (Figure 3.4-7). Foraging habitat for this species is also present in tidal portions of streams in the Program Renewal Area, and individuals may occasionally forage in tidal habitats in the Program Renewal Area year-round. An individual was also detected in freshwater marsh habitat at Rancho

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
			San Antonio in June 2023 and March 2024, but nesting has not been documented at this location.
Western snowy plover (*Charadrius nivosus nivosus*)	FT, CSSC	Sandy beaches on marine and estuarine shores and salt pannes in the San Francisco Bay saline managed ponds	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Nests on levees, islands, and salt flats in some of the South Bay saline-managed ponds in the Program Renewal Area. Documented nesting in Crittenden Marsh in Mountain View; in Alviso complex Ponds A3N, A6, A8S, A9, A12, A13, A15, A6, and A17; and in New Chicago Marsh and the adjacent impoundment in Alviso from 2009–2021 (San Francisco Bay Bird Observatory 2024) (Figure 3.4-8). Forages in these same areas and on levees and managed pond bottoms in other ponds along the Bay edge. Suitable foraging habitat is present along Program Renewal streams within the Program Renewal Area, and snowy plovers may forage along these streams year-round. Individuals are not expected to nest within Program Renewal work areas; however, nesting pairs may be present in immediately adjacent ponds.
California least tern (*Sternula antillarum browni*)	FE, SE, SP	Nests along the coast on bare or sparsely vegetated, flat substrates; in the South Bay, nests in salt pannes and on an old airport runway; forages for fish in open waters	**Present as Nonbreeder in Program Renewal Area, May be Present in Program Renewal Work Areas.** Does not nest in the Program Renewal Area; however, the South Bay is an important post-breeding staging area for least terns. Most such staging has occurred outside of (but close to) the Program Renewal Area in managed ponds along the Bay in the Mountain View/Sunnyvale area (occasionally in the Alviso area). When this species is observed in the Program Renewal Area vicinity, it is seen foraging in managed ponds and over the more extensive open bay. Although least terns could forage on occasion along tidal portions of Program Renewal Area streams, they likely do so infrequently and in low numbers.
Least Bell's vireo (*Vireo bellii pusillus*)	FE, SE, VHP	Nests in heterogeneous riparian habitat, often dominated by cottonwoods and willows	**Unlikely to Occur in Program Renewal Area and Program Renewal Work Areas.** The only breeding records in Santa Clara County are from Llagas Creek southeast of Gilroy in 1997 and the Pajaro River south of Gilroy in 1932 (Figure 3.4-9). The only other confirmed records are of one or two singing males along lower Llagas Creek in May 2001 and a spring migrant in Alviso in May 2016. A singing male Bell's vireo in June 2006 along Coyote Creek near the Coyote Creek Golf Club was heard only, and hence may have been either a least Bell's vireo or a vagrant eastern Bell's vireo (*V. b. bellii*), a subspecies that has also occurred in the Program Renewal Area. Although least Bell's vireos may increase in number and distribution in Santa Clara County as core populations increase, it is unlikely to be more than a rare and very locally occurring breeder along South County streams.
Tricolored blackbird (*Agelaius tricolor*)	ST, VHP	Highly colonial nester that establishes dense breeding colonies in	**Present in Program Renewal Area and Program Renewal Work Areas.** Typically nests in extensive stands of tall emergent herbaceous vegetation in freshwater marshes, ponds, and reservoirs. In the Program Renewal Area, nesting colonies of this

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
		emergent vegetation, grain fields, fallow fields, extensive thickets of blackberry, ruderal vegetation such as mustard or thistle, and occasionally in early-successional riparian habitat. Nesting colonies usually are located near fresh water. Tricolored blackbirds are itinerant nesters, and because their nesting habitat is ephemeral, it is possible for this species to colonize or recolonize an area as suitable breeding habitat becomes available.	species are itinerant and patchily distributed, their distribution reflecting the patchy nature of the species' breeding habitat (Rottenborn 2007a). Tricolored blackbirds occur as uncommon nonbreeding foragers throughout most of the Program Renewal Area.
Salt marsh harvest mouse (*Reithrodontomys raviventris*)	FE, SE, SP	Salt marsh habitat dominated by common pickleweed or alkali bulrush; recent studies have indicated that the species also utilizes brackish marshes, non-tidal managed wetlands, and some adjacent upland habitats (Smith 2019)	**Present in Program Renewal Area and Program Renewal Work Areas.** Known to occur in the Program Renewal Area in saline and brackish marshes, particularly those dominated by pickleweed or dense mature tri-corner bulrush around the Bay edge, including both fully tidal and diked/muted tidal marshes (H. T. Harvey & Associates 2016) (Figure 3.4-10). Individuals may occur in Program Renewal work areas where suitable habitat is present, especially where this habitat is connected to extensive tidal marshes.

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Mountain lion, Central Coast ESU (*Puma concolor*)	SC, VHP*	Has a large home range size and occurs in a variety of habitats. Natal dens are typically located in remote, rugged terrain far from human activity. May occasionally occur in areas near human development, especially during dispersal.	**Present in Program Renewal Area and Program Renewal Work Areas.** Within the Program Renewal Area, there are verified sightings reported on the Bay Area Puma Project (2024) and numerous unpublished reports. Occurs widely, though at low densities, throughout the Santa Cruz Mountains and Diablo Range, and may disperse into lowland/Valley floor areas. Mountain lions are not expected to occur within urbanized portions of the Program Renewal Area due to high levels of human activity, except as rare dispersants along the peripheries of developed areas. Open lands on the periphery of the Program Renewal Area provide suitable foraging and dispersal habitat for this species, and individuals likely occur in these areas periodically and in low numbers. However, mountain lions are not expected to den or breed along or near Program Renewal Area channels due to human disturbance.
San Joaquin kit fox (*Vulpes macrotis mutica*)	FE, ST, VHP	Flat or gently sloping grasslands, mostly on the margins of the San Joaquin Valley and adjacent valleys	**May be Present in Program Renewal Area and Program Renewal Work Areas.** May occur only in the southeastern portion of the Program Renewal Area, in the vicinity of Pacheco Creek and the uppermost reaches of the Pajaro River. If it occurs here at all, it is likely to occur in low numbers, and infrequently, during dispersal between areas of known breeding activity outside the Program Renewal Area.

Name (Scientific Name)	Status1	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
California Species of Special Concern			
Central Valley fall-run Chinook salmon (*Oncorhynchus tshawytscha*)	CSSC	Cool rivers and large streams that reach the ocean and that have shallow, partly shaded pools, riffles, and runs.	**Present in Program Renewal Area and Program Renewal Work Areas.** Has been observed in Program Renewal Area streams since the mid-1980s (Leidy et al. 2003) and is known to occur in the Program Renewal Area in the Guadalupe River, Guadalupe Creek, Alamitos Creek, Calero Creek, Los Gatos Creek, and Coyote Creek, in very small numbers (Leidy et al. 2003, Valley Water unpublished data, Valley Water and Stillwater Sciences 2017). Uses the lower reaches of Coyote Creek and Alviso Slough as migration corridors between estuarine habitats and upstream spawning and rearing habitats. However, genetic analysis suggests that Chinook currently occurring in South Bay streams are all derived from hatchery stock (Garcia-Rossi and Hedgecock 2002, Valley Water 2018). Because the hatchery fish are released into San Francisco Bay and the Pacific Ocean as juveniles, they lack a strong homing instinct, which leads them to be more likely to stray to various river systems in the San Francisco Bay such as Coyote Creek and the Guadalupe River watersheds. Conditions for successful spawning in the Program Renewal Area are marginal because these fish spawn during fall when streamflow is at its lowest; however, successful spawning has been observed in Coyote Creek and the Guadalupe River (Valley Water 2018). Despite occasional occurrences and successful spawning, there is no evidence that Chinook salmon have become naturalized in the Program Renewal Area.
Pacific lamprey (*Entosphenus tridentata*)	CSSC	Cool streams with suitable spawning habitat and conditions allowing migration between spawning and marine habitats. Spawns in gravel-bottomed streams or rivers upstream of riffle habitat. Adults forage in marine areas.	**Present in Program Renewal Area and Program Renewal Work Areas.** Historically, this species may have been present in streams throughout the Program Renewal Area. It is currently known to occur in the Guadalupe River, San Francisquito Creek, Lower Silver Creek, Guadalupe Creek, Alamitos Creek, Los Gatos Creek, Uvas Creeks, Coyote Creek, Upper Penitencia Creek, and Stevens Creek, and may be locally common in these areas (Leidy 2007, Valley Water fish sampling and relocation data 2002–2009, USFWS et al. 2012, Valley Water 2020a, 2021a). The species' status is poorly documented, and abundance in other streams throughout the Program Renewal Area is poorly understood. Populations may be present in all accessible portions of streams in the Program Renewal Area during migration between spawning areas and marine foraging habitat.

Name (Scientific Name)	Status1	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Riffle sculpin (*Cottus gulosus*)	CSSC	Permanent headwater streams with rocky or gravel substrates and adequate cover.	**Present in Program Renewal Area and Program Renewal Work Areas.** Within the Program Renewal Area, riffle sculpin occur in the Guadalupe River, Guadalupe Creek, and Los Gatos Creek (Valley Water unpublished data 2004–2017; Valley Water 2019c, 2020b, and 2021b); Upper Penitencia Creek (Valley Water 2021a); San Francisquito Creek (Leidy 2007); the Pajaro River (Moyle et al. 2015); and Uvas Creek (Casagrande 2010).
Sacramento hitch (*Lavinia exilicauda exilicauda*)	CSSC	Prefer warm, lowland waters, but are also known to be abundant in cool, clear streams. Spawning can occur in riffles, ponds, and reservoirs.	**Present in Program Renewal Area and Program Renewal Work Areas**. Within the Program Renewal Area, Sacramento hitch occur in Coyote Creek and Coyote Reservoir (Leidy 2007, Valley Water 2020a, Valley Water 2020c); the Guadalupe River, Los Gatos Creek, and Saratoga Creek (Leidy 2007); Anderson Reservoir (Smith 2013, Leidy 2007, Stillwater Sciences 2018); and San Francisquito Creek (Leidy 2007).
Southern coastal roach (*Hesperoleucus venustus subditus*)	CSSC	Occur in a wide array of habitats and are tolerant of intermittent surface water, a range of temperatures, and low dissolved oxygen. Spawn in shallow habitats with flow and coarse substrates.	**Present in Program Renewal Area and Program Renewal Work Areas.** Within the Program Renewal Area, southern coastal roach occur in Coyote Creek and Upper Penitencia Creek (Valley Water 2008, Smith 2020, Valley Water 2021a, 2022), as well as Uvas Creek, Llagas Creek, North Fork Pacheco Creek, and Arroyo Dos Picachos (Moyle et al. 2015).
Monterey hitch (*Lavinia exilicauda harengus*)	CSSC	Abundant in lowland areas with large pools or in small reservoirs.	**Present in Program Renewal Area and Program Renewal Work Areas.** Monterey hitch occur in the Pajaro River, Uvas Creek, Llagas Creek, and Pacheco Creek in the Program Renewal Area (Casagrande 2010, Moyle et al. 2015).
Santa Cruz black salamander (*Aneides niger*)	CSSC	Mixed deciduous and coniferous woodlands and coastal grasslands. Adults found under rocks, talus, and moist woody debris.	**May be Present in Program Renewal Area and Program Renewal Work Areas.** Known to occur in the Program Renewal Area vicinity in Santa Cruz mountains and foothills from northern Santa Clara County south to the Santa Teresa Hills (CNDDB 2024) (Figure 3.4-11). Suitable refugia for Santa Cruz black salamanders are present under rocks and moist woody debris within the Program Renewal Area. Small numbers of individuals may also traverse work areas when moving between upland habitats in the vicinity, especially during rain events.

Name (Scientific Name)	Status1	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
California giant salamander (*Dicamptodon ensatus*)	CSSC	Adults found in wet forests under rocks and logs near streams. Uses cold, clear streams for breeding.	**May be Present in Program Renewal Area and Program Renewal Work Areas.** Known to occur in the Program Renewal Area vicinity in Santa Cruz mountains and foothills from northern Santa Clara County south to the Santa Teresa Hills (CNDDB 2024) (Figure 3.4-11). Suitable stream breeding habitat for this species is present in the Program Renewal Area in the foothills of the Santa Cruz Mountains, and suitable refugia are present under rocks and woody debris near wetlands. Small numbers of individuals may also traverse work areas when moving between habitats in the vicinity, especially during rain events.
Red-bellied newt (*Taricha rivularis*)	CSSC	Riparian, broadleaf, or coniferous forest in the Coast Range. Breeds in streams with moderate to fast flows.	**Absent from Program Renewal Area and Program Renewal Work Areas.** A small population is known to occur in upper Stevens Creek County Park in Santa Clara County (CNDDB 2024). However, this population is located outside the Program Renewal Area, and individuals from this population are not expected to travel to the Program Renewal Area where they could be affected by maintenance activities. In addition, this population is highly disjunct from the species' primary range located north of the San Francisco Bay (Reilly et al. 2014, Thomson et al. 2016), and appears to be limited to a very small area in the upper Stevens Creek watershed (de Leon 2021). Research has been unable to determine whether this population is likely a natural remnant population or the result of a past introduction (Reilly et al. 2014).
Coast horned lizard (*Phrynosoma blainvillii*)	CSSC	Open habitats with sandy, loosely textured soils, such as chaparral, coastal scrub, annual grassland, and clearings in riparian woodlands with the presence of native harvester ants (*Pogonomyrmex barbatus*)	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** In Santa Clara County, this species occurs primarily in arid areas in the interior of the Diablo Range, with much more limited occurrence in the Santa Cruz Mountains. Recorded in the Program Renewal Area only near Calero Reservoir (CNDDB 2024) (Figure 3.4-11). Likely restricted to a few locations on the margins of the Program Renewal Area.

Name (Scientific Name)	Status1	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Redhead (*Aythya americana*)	CSSC (nesting)	Nests in marshes and at bayside pond margins	**May be Present in Program Renewal Area and Program Renewal Work Areas.** Documented nesting in the Program Renewal Area only on a few occasions, including in the 1970s and 1980s at the Palo Alto Flood Control Basin and in 2018 in Pond A16 at the Don Edwards National Wildlife Refuge (South Bay Birds List-Serve 2024). Oversummering individuals are observed in baylands areas of Santa Clara County in small numbers each year (CNDDB 2024, South Bay Birds List-Serve 2024). There is a low probability of nesting in baylands habitats within the Program Renewal Area.
Least bittern (*Botaurus exilis*)	CSSC (nesting)	Nests and forages in freshwater marshes	**Present in Program Renewal Area, May be Present as Nonbreeder in Program Renewal Work Areas.** Historically a very rare nonbreeding visitor to the Program Renewal Area, but a pair of least bitterns was documented nesting at Calero Reservoir in 2022. Small numbers of individuals may continue to nest at Calero Reservoir or elsewhere in the Program Renewal Area where suitable habitat is present (e.g., the Ogier Ponds). However, the species is unlikely to nest in areas where Program Renewal activities are projected.
Black skimmer (*Rynchops niger*)	CSSC (nesting)	Nests on abandoned levees and islands in saline managed ponds and marshes	**Present in Program Renewal Area, May be Present as Nonbreeder in Program Renewal Work Areas.** Black skimmers are an uncommon resident that have nested in the South Bay since 1994. Within the Program Renewal Area, the species has nested on islands in saline managed ponds in the Alviso area (e.g., on ponds AB1, AB2, A1, A2W, A7, A8 and A16, and Pond A12 (Bousman 2007a), as well as at Shoreline Lake. No suitable nesting habitat for black skimmers is present within Program Renewal work areas. Individuals forage along tidal sloughs within Program Renewal work areas, but they are not expected to occur away from tidal/bayland areas (e.g., along streams or at inland lakes and reservoirs).
Northern harrier (*Circus cyaneus*)	CSSC (nesting)	Nests in marshes and moist fields, forages over open areas	**Present in Program Renewal Area and Program Renewal Work Areas.** Within the Program Renewal Area, potential nesting habitat is present primarily in tidal marshes along sloughs, in diked/muted tidal salt marshes near the Bay, in fallow fields and pastures in Coyote Valley, and in fallow fields and wetlands along lower Llagas Creek, Carnadero Creek, Pacheco Creek, and the Pajaro River. The species is known to nest near Program Renewal work areas where suitable habitat is present. Nonbreeding individuals forage regularly in grassland, agricultural, and wetland habitats throughout the Program Renewal Area, and can occur in high densities in some years (e.g., during vole outbreaks).

Name (Scientific Name)	Status1	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Long-eared owl (*Asio otus*)	CSSC (nesting)	Riparian bottomlands with tall, dense willows and cottonwood stands (also dense live oak and the California Bay along upland streams); forages primarily in adjacent open areas	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Rare resident and occasional winter visitor in Santa Clara County. Historical breeding records exist for the Santa Clara Valley floor, and one recent nest was recorded at Ed Levin County Park west of Calaveras Reservoir (Noble 2007). Additional individuals have been detected in Santa Clara County during the breeding season in Foothills Park and Monte Bello Open Space Preserve (Cornell Lab of Ornithology 2024). Long-eared owls could breed in oak woodlands, riparian habitats, and other wooded habitats in the foothills of the Santa Cruz Mountains and the Diablo Range, though likely only in very low numbers.
Short-eared owl (*Asio flammeus*)	CSSC (nesting)	Nests in marshes and moist fields, forages over open areas	**May be Present in Program Renewal Area, Unlikely to Occur in Program Renewal Work Areas.** Has been recorded nesting in the Program Renewal Area only in the Palo Alto Flood Control Basin, although it has not been confirmed nesting there since the 1970s. Low probability of nesting elsewhere.

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Burrowing owl (*Athene cunicularia*)	CSSC, VHP	Prefers grasslands and ruderal habitats, typically with sparse or nonexistent tree or shrub canopies. In California, burrowing owls are found in close association with California ground squirrels; owls use the abandoned burrows of ground squirrels for shelter and nesting. The nesting season as recognized by the CDFW extends from February 1 through August 31. After nesting is completed, adult owls may remain in their nesting burrows or in nearby burrows, or they may migrate; young birds disperse across the landscape from 0.1 to 35 miles from their natal burrows.	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Present year-round in the Program Renewal Area in open, agricultural, and grassland areas where active ground squirrel burrows are present. However, this species has undergone a substantial decline in Santa Clara County. Small populations of breeding and overwintering burrowing owls continue to be present at the San Jose International Airport, in the North San Jose/Alviso area, at Moffett Federal Airfield, and at Shoreline Park in Mountain View (Figure 3.4-12). Individuals occur more widely in grassland and agricultural areas throughout Santa Clara County, particularly in foothills on either side of the Santa Clara Valley, during migration and winter.

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Vaux's swift (*Chaetura vauxi*)	CSSC (nesting)	Nests in snags in coastal coniferous forests or, occasionally, in chimneys; forages aerially	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** In the South Bay, nests primarily in snags in forests of the Santa Cruz Mountains but will also nest in residential chimneys in the Santa Cruz Mountain foothills from northern Santa Clara County south to Calero County Park (Rottenborn 2007b). Swifts have been observed foraging widely over various habitats, but most commonly in suburban areas having chimneys suitable for nesting, such as Los Gatos, Los Altos, Los Altos Hills, Cupertino, and Campbell. Thus, this species likely breeds more commonly than currently recorded (though still in small numbers) in residential areas in the northwestern part of the Program Renewal Area. Forages aerially over these areas during the breeding season, and anywhere over the larger Program Renewal Area during migration.
Purple martin (*Progne subis*)	CSSC (nesting)	Nest in abandoned woodpecker holes. Forages aerially for insects.	**Present as Nonbreeder in Program Renewal Area, and Program Renewal Work Areas.** Purple martins occur as scarce migrants throughout the Program Renewal Area and as rare and local breeders along the ridgeline of the Santa Cruz Mountains (Sequoia Audubon Society 2001, Rana Creek Habitat Restoration 2002, Cornell Lab of Ornithology 2024). Known summering and nesting locations include the southern edge of Sierra Azul Open Space Preserve along Loma Prieta Road (Cornell Lab of Ornithology 2024). Nesting individuals from the Santa Cruz Mountains are known to forage at lower elevations, such as at Calero Reservoir (Cornell Lab of Ornithology 2024). The species is not known to nest in the Program Renewal Area, but nesting could possibly occur in forested areas below 1,000 feet elevation.
Olive-sided flycatcher (*Contopus cooperi*)	CSSC (nesting)	Breeds in mature forests with open canopies, along forest edges in more densely vegetated areas, in recently burned forest habitats, and in selectively harvested landscapes	**May be Present in Program Renewal Area and Program Renewal Work Areas.** Common summer resident in western Santa Clara County (Bousman 2007b). This species breeds widely in the Santa Cruz Mountains, and more sparingly in the Diablo Range, but does not breed on the Santa Clara Valley floor. Few pairs nest at sites below 1,000 feet elevation but confirmed breeding has occurred at elevations as low as 400 feet (Bousman 2007b).

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Loggerhead shrike (*Lanius ludovicianus*)	CSSC (nesting), VHP*	Nests in tall shrubs and dense trees; forages in grasslands, marshes, and ruderal habitats	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** This species' population in Santa Clara County has declined in recent years. Loggerhead shrikes are currently known to nest regularly only in small numbers in the southern part of the Program Renewal Area (Cornell Lab of Ornithology 2024). Occasional individuals are also periodically observed during the nesting season in open habitats of northern Santa Clara County along San Francisco Bay, and in the Coyote Valley and Morgan Hill areas, and small numbers may still breed in those areas. Occurs slightly more widely (i.e., in smaller patches of open areas providing foraging habitat) during the nonbreeding season.
Yellow warbler (*Setophaga petechia*)	CSSC (nesting)	Nests in riparian woodlands	**Present in Program Renewal Area and Program Renewal Work Areas.** Uncommon breeder in wooded riparian habitats in the Program Renewal Area. Prefers riparian corridors with an overstory of mature cottonwoods and sycamores, a midstory of box elder and willow, and a substantial shrub understory (Bousman 2007c), particularly in areas with more open space adjacent to the riparian habitat (rather than in heavily developed areas). The species is an abundant migrant throughout the Program Renewal Area during the spring and fall.
San Francisco common yellowthroat (*Geothlypis trichas sinuosa*)	CSSC	Nests in herbaceous vegetation, usually in wetlands or moist floodplains	**Present in Program Renewal Area and Program Renewal Work Areas.** Yellowthroats nesting from the northern San Jose/Milpitas/Santa Clara/Los Gatos area northward, both along the edge of the Bay and in riparian and wetland habitats inland, are likely of the special-status *sinuosa* subspecies, whereas those in areas farther south are likely of the more widespread *arizela* subspecies (Figure 3.4-13). The greatest proportion of breeding records of *sinuosa* in the Program Renewal Area are from brackish and freshwater marshes near the edge of the Bay, and early successional riparian habitat in broader floodplains along lower Coyote Creek and the Guadalupe River (Bousman 2007d). Nests typically are located in extensive stands of bulrushes in brackish marshes and dense cattail beds in freshwater marsh habitat, but also are found in forbs in riparian habitats.

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Yellow-breasted chat (*Icteria virens*)	CSSC (nesting)	Nests in dense stands of willow and other riparian habitat	**May be Present in Program Renewal Area and Program Renewal Work Areas.** Rare breeder, and only slightly more regular transient, in willow-dominated riparian habitats in the Program Renewal Area. Historically, it likely bred more widely in Santa Clara County, but it is now rare because of the loss of suitable breeding habitat and brood parasitism in brown-headed cowbirds. In the Program Renewal Area, the species is most numerous and occurs most regularly on lower Llagas Creek, but it has been recorded along Coyote Creek in the vicinity of Hellyer Park upstream, and it likely occurs in low numbers on other streams south of the more urbanized San Jose area. The species occurs as a very scarce migrant throughout the Program Renewal Area during the spring and fall.
Alameda song sparrow (*Melospiza melodia pusillula*)	CSSC	Nests in salt marsh, primarily in marsh gumplant and cordgrass along channels	**Present in Program Renewal Area and Program Renewal Work Areas.** Endemic to Central and South San Francisco Bay. In the Program Renewal Area, this species occurs in the taller vegetation found along tidal sloughs, including salt marsh cordgrass and marsh gumplant, near the South Bay. The approximate location of the interface between populations of the Alameda song sparrow and those of the race breeding in freshwater riparian habitats (*gouldii*) in Santa Clara County is shown on Figure 3.4-13.
Grasshopper sparrow (*Ammodramus savannarum*)	CSSC (nesting)	Breeds and forages in grasslands, meadows, fallow fields, and pastures	**Present in Program Renewal Area, May be Present Adjacent to Program Renewal Work Areas.** Nests in extensive grasslands with some heterogeneity, including serpentine grasslands. In the Program Renewal Area, breeding birds occur in the foothills of the Santa Cruz Mountains and from Calaveras Reservoir southeast to the hills above Pacheco Creek (Heller 2007). Breeding birds also occur in the southeast portion of the Program Renewal Area, where the hills drop down to the Pajaro River Valley (Heller 2007). Within these areas, nesting individuals may be present where extensive grasslands are located adjacent to Program Renewal Area channels. This species occurs in low numbers in grasslands throughout the Program Renewal Area during migration and winter (Cornell Lab of Ornithology 2024).
Bryant's savannah sparrow (*Passerculus sandwichensis alaudinus*)	CSSC	Nests in pickleweed dominated salt marsh and adjacent ruderal habitat	**Present in Program Renewal Area and Program Renewal Work Areas.** Breeds in the Program Renewal Area primarily in short pickleweed-dominated portions of diked/muted tidal salt marsh habitat, and in adjacent ruderal habitat, in the South San Francisco Bay (Rottenborn 2007c). Breeding also has been confirmed in expanses of short grassland in inland/non-instream areas on the west side of the Coyote Valley and in the Santa Cruz Mountain foothills just north of the Pajaro River Valley (Rottenborn 2007c). During the nonbreeding season, *alaudinus* and other savannah sparrow subspecies may forage in open areas throughout the Program Renewal Area.

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Salt marsh wandering shrew (*Sorex vagrans halicoetes*)	CSSC	Medium-high marsh 6 to 8 feet above sea level with abundant driftwood and common pickleweed	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Formerly more widely distributed in the Bay Area. This small insectivorous mammal is now confined to salt marshes of the South Bay (Findley 1955). Salt marsh wandering shrews occur most often in medium-high wet tidal marsh (6 to 8 feet above sea level), with abundant driftwood and other debris for cover (Shellhammer 2000). They also have been recorded occasionally in diked marsh. This species typically is found in fairly tall pickleweed, in which these shrews build nests. Individuals may occur in Program Renewal work areas where suitable habitat is present, especially where this habitat is connected to extensive tidal marshes (Figure 3.4-10).
Pallid bat (*Antrozous pallidus*)	CSSC	Forages over many habitats; roosts in caves, rock outcrops, buildings, and hollow trees	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Historically, may be present in a number of locations throughout the Program Renewal Area, but this species has declined in recent decades. Known maternity colonies in the Program Renewal Area occur at several locations. Suitable roosting sites are present in a number of other locations, particularly in or near open space or less developed areas around the periphery of the Program Renewal Area, and the species may be more widespread than is known. Individuals could forage in the Program Renewal Area in open areas located within several miles of colonies.
Townsend's big-eared bat (*Corynorhinus townsendii*)	CSSC	Roosts in caves and mine tunnels, and occasionally in deep crevices in trees such as redwoods or in abandoned buildings, in a variety of habitats	**May be Present as Nonbreeder in Program Renewal Area and Program Renewal Work Areas.** No known extant populations are present on the Santa Clara Valley floor, and no breeding sites are known from the Program Renewal Area. Occasional individual Townsend's big-eared bats may roost and forage in suitable habitats nearly anywhere in the Program Renewal Area, but such individuals are expected to occur very infrequently and in small numbers. Roosting colonies are known from the UTC property east of Coyote Ridge near Metcalf Road and at Almaden-Quicksilver County Park. Although both locations are outside the Program Renewal work areas, these records indicate the potential for this species to occur in suitable habitat in the Program Renewal Area, possibly near southern Coyote Ridge and northern Anderson Reservoir or in the Guadalupe Mines area. Individuals are occasionally recorded roosting on the Santa Clara Valley floor, such as in Coyote Valley and Morgan Hill, and near Calero Reservoir.

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
Western red bat (*Lasiurus blossevillii*)	CSSC	Roosts in foliage in forest or woodlands, especially in or near riparian habitat	**May be Present as Nonbreeder in Program Renewal Area and Program Renewal Work Areas.** Individual western red bats occur in the Program Renewal Area vicinity in low numbers as migrants and winter residents, but this species does not breed in the South Bay. Individual western red bats may roost in the foliage of trees virtually anywhere in the Program Renewal Area, but they are expected to roost primarily in riparian areas.
San Francisco dusky-footed woodrat (*Neotoma fuscipes annectens*)	CSSC	Nests in a variety of habitats including riparian areas, oak woodlands, and scrub	**Present in Program Renewal Area and Program Renewal Work Areas.** This species is locally common on the Santa Clara Valley floor throughout the Program Renewal Area where suitable habitat is present, including within some urban areas. Occurs more regularly along less urbanized reaches of a number of streams, as well as in rural and natural areas on the Valley floor and in the foothills of the Santa Cruz Mountains and the Diablo Range (H. T. Harvey & Associates 2010a).
American badger (Taxidea taxus)	CSSC, VHP*	Burrows in grasslands and occasionally in infrequently disked agricultural areas	**Present in Program Renewal Area and Program Renewal Work Areas.** Known to occur in the Program Renewal Area primarily in grasslands and less frequently disturbed agricultural habitats, mostly in the foothills but sometimes on the Valley floor. The majority of occurrences in the Program Renewal Area are from the Coyote Valley area and northern Morgan Hill (CNDDB 2024). An individual was also observed by Valley Water staff at Slopeview Reservoir in eastern San Jose in 2021. Not expected to establish dens within or immediately adjacent to the Program Renewal Area due to high levels of human disturbance.
State Fully Protected Species			
Golden eagle (*Aquila chrysaetos*)	SP	Breeds on cliffs or in large trees (rarely on electrical towers), forages in open areas	**Present in Program Renewal Area, May be Present in Program Renewal Work Areas.** Breeds widely in the Diablo Range and less commonly in the Santa Cruz Mountains, mostly above the elevation of the Program Renewal Area, but a few pairs breed at the edges of the Santa Clara Valley at elevations within the Program Renewal Area (Bousman 2007e). A pair of eagles has also nested in recent years in buffer lands of the San Jose-Santa Clara Regional Wastewater Facility in the Program Renewal Area. Forages somewhat more widely, especially during the nonbreeding season, in agricultural/open space areas on the Valley floor, such as in the Alviso area, in Coyote Valley, and in the Pajaro River watershed. Unlikely to nest in or very close to Program Renewal work areas.

Name (Scientific Name)	Status[1]	Habitat Association	Potential to Occur in the Program Renewal Area and Program Renewal Work Areas
White-tailed kite (*Elanus leucurus*)	SP	Nests in tall shrubs and trees, forages in grasslands, marshes, and ruderal habitats	**Present in Program Renewal Area and Program Renewal Work Areas.** Nests in northern Santa Clara County in the foothills of the Santa Cruz Mountains, along the edges of the San Francisco Bay from Palo Alto to Milpitas, and in the foothills of the Diablo Range east of Milpitas (Mammoser 2007). Also a fairly common breeder along Llagas and Uvas/Carnadero Creeks and the Pajaro River in southern Santa Clara County. Individuals also nest at scattered locations in the foothills of the Santa Cruz Mountains and the Diablo Range on either side of the urbanized Valley floor, and occasionally in urban areas on the periphery of open foraging habitats. Occurs as a common forager in open habitats throughout the Program Renewal Area during the nonbreeding season.
Ringtail (*Bassariscus astutus*)	SP	Cavities in rock outcrops and talus slopes, as well as hollows in trees, logs, and snags that occur in riparian habitats and dense woodlands, usually in close proximity to water	**May be Present in Program Renewal Area and Program Renewal Work Areas.** Ostensibly suitable habitat is present in forested areas at the upper margins of the Program Renewal Area, but few confirmed records exist. The species has been observed along Summit Road and near Highway 152 just west of Gilroy along Redwood Retreat Road, and it may be present in other areas removed from urbanization. However, given the very low numbers of detections, this species is likely very scarce and localized in occurrence in the Program Renewal Area, and it is likely absent from most Program Renewal work areas, such as valley-floor streams close to urban, suburban, or agricultural activity.
Other Special-Status Species			
Pacific harbor seal (*Phoca vitulina richardsi*)	MMPA	Found throughout the northern Atlantic and Pacific Oceans along coastal waters, river mouths, and bays	**May be Present in Program Renewal Area and Program Renewal Work Areas.** Permanent resident of the San Francisco Bay, where a primary haul-out site is located at Mowry Slough northeast of the Program Renewal Area. Suitable haul-out sites for harbor seals are present in the Program Renewal Area in the tidal reaches of sloughs in the South Bay, and use of haul-out sites varies over time. No pupping sites are currently known within the Program Renewal Area, although potentially suitable pupping habitat is present.

Sensitive Natural Communities, Vegetation Alliances, and Habitats

Waters of the U.S./Waters of the State

As described in Section 3.4.2 "Regulatory Setting" above, impacts to wetlands and other waters of the U.S. are regulated under CWA Section 404, and impacts to waters of the state are regulated under CWA Section 401, CWA Section 403, and the Porter-Cologne Water Quality Control Act. A number of aquatic and wetland features throughout the Program Renewal Area are expected to be considered waters of the U.S. by the USACE and waters of the state by the RWQCB. These features include the riverine, wetland, and open water land cover types described above, as well as tidal and intertidal habitats. Many of these regulated waters are unvegetated "other waters," including areas of open waters. However, regulated areas supporting vegetated wetlands, including coastal and valley freshwater marsh, seasonal wetland, and tidal and intertidal habitats, are also present. The precise extent to which these features are jurisdictional waters of the U.S./state will be determined by Valley Water in jurisdictional delineations performed during the course of the Program Renewal and verified by the USACE and RWQCB as necessary.

Whereas USACE jurisdiction over waters of the U.S. extends upslope only as far as the ordinary high water mark along streams and other waterbodies in the Program Renewal Area, the RWQCB may claim jurisdiction over riparian habitats (e.g., riparian forest and scrub land cover types) located farther upslope to the top of bank or the outer edge of the canopy of riparian vegetation rooted below top of bank, whichever is greater, as waters of the state. In addition, per the *Sackett v. Environmental Protection Agency* U.S. Supreme Court decision and subsequent federal regulations implementing this decision, USACE jurisdiction is limited to wetlands having a continuous surface connection with traditional navigable waters, whereas RWQCB jurisdiction may include wetlands that are not connected to traditional navigable waters. Therefore, the extent of waters of the state in the Program Renewal Area is greater than the extent of waters of the U.S.

Beds and Banks Regulated Under California Fish and Game Code Sec. 1600 et seq.

As described in Section 3.4.2 "Regulatory Setting" above, the CDFW regulates diversions or activities that alter the bed and banks of rivers, lakes, and streams in California. In the Program Renewal Area, features whose alteration would be regulated by the CDFW under Section 1600 of the F&G Code include the riverine (streams) land cover type; ponds that are in-line with streams (e.g., Almaden Lake); and coastal and valley freshwater marsh, seasonal wetland, riparian habitats, and tidal habitats associated with those features. In general, CDFW jurisdiction over such features extends upslope to the top of bank or the outer edge of the riparian canopy, whichever is greater.

Other Sensitive Habitats

OAK WOODLANDS

Oak woodlands, which in the Program Renewal Area include the valley oak woodland, mixed oak woodland and forest, blue oak woodland, and coast live oak forest and woodland VHP land cover types, are considered one of California's most productive and important natural communities. They support a rich plant and wildlife community, supporting high numbers of mammal and bird species. In addition, oak trees play an important role in helping to maintain water quality in streams and rivers by reducing erosion, yet more than a million

acres of oak savannah and oak woodlands in California are estimated to have been lost since 1945. Major factors contributing to the loss of oak woodlands include urban growth, conversion to agriculture, lack of regeneration of oak trees, and habitat fragmentation. As a result, numerous state and local agencies have established guidelines, regulations, and ordinances regarding the conservation of oak woodlands (e.g., Oak Woodlands Conservation Act [Fish and Game Code Section 1360-1372] and Senate Bill 1334.

CDFW SENSITIVE NATURAL COMMUNITIES

Natural communities have been considered part of the Natural Heritage Conservation triad, along with plants and animals of conservation significance, since the state inception of the Natural Heritage Program Renewal in 1979. The CDFW determines the level of rarity and imperilment of vegetation types and tracks sensitive communities in its Rarefind database (CNDDB 2024). Global rankings (G) of natural communities reflect the overall condition (rarity and endangerment) of a habitat throughout its range, whereas state (S) rankings are a reflection of the condition of a habitat within California. Natural communities are defined using NatureServe's standard heritage Program Renewal methodology as follows:

G1/S1: Critically imperiled

G2/S2: Imperiled

G3/S3: Vulnerable

G4/S4: Apparently secure

G5/S4: Secure

In addition to tracking sensitive natural communities, the CDFW also ranks vegetation alliances, defined by repeating patterns of plants across a landscape that reflect climate, soil, water, disturbance, and other environmental factors (Sawyer et al. 2009). If an alliance is marked G1-G3, all of the vegetation associations within it will also be of high priority (CDFW 2024a). The CDFW provides the Vegetation Classification and Mapping Program's (VegCAMP) currently accepted list of vegetation alliances and associations (CDFW 2024a). Within the Program Renewal Area, a number of sensitive associations may occur within the following habitat types: non-serpentine native grassland; serpentine rock outcrop/barrens; serpentine bunchgrass grassland; coyote brush scrub; northern coastal scrub/Diablan sage scrub; northern mixed chaparral/chamise chaparral; mixed serpentine chaparral; valley oak woodland, coast live oak woodland, mixed oak woodland and forest, and blue oak woodland; willow riparian forest and scrub; central California sycamore alluvial woodland; mixed riparian woodland and forest, coastal and valley freshwater marsh, and seasonal wetland. CDFW sensitive natural communities known or likely to occur within the Program Renewal Area are serpentine bunchgrass grassland, seasonal wetland, and sycamore alluvial woodland (CNDDB 2024, Holland 1986, Sawyer et al. 2009).

Northern coastal salt marsh once occurred extensively in the tidally influenced lowlands surrounding San Francisco Bay but is now located in tidal saline habitats only at the extreme northern edge of the Program Renewal Area. In the South Bay much of this habitat was reduced from historical conditions due to filling for development, landfills, and other uses;

installation of flood protection structures which remove or mute tidal influence; and construction of levees to create managed ponds in areas that used to be extensive marshes. This community supports a wide variety of plant and animal species specifically adapted to the dynamic hydrologic conditions and high salinities that occur within tidally influenced areas, including federally endangered species such as the salt marsh harvest mouse.

Although maintenance activity areas will not geographically overlap areas of serpentine, they may occur adjacent to serpentine habitats. Serpentine bunchgrass generally supports native plant communities including rare plants such as the federally endangered and CRPR 1B.1 Santa Clara Valley dudleya and Metcalf Canyon jewel-flower as well as the CRPR 1B.2 most beautiful jewel-flower (*Streptanthus albidus* ssp. *peramoenus*) and smooth lessingia. Several invertebrate species, including the federally threatened Bay checkerspot butterfly, depend on serpentine grasslands because their host food plants are found primarily in these habitats. Likewise, serpentine outcrops/barrens, serpentine chaparral, and serpentine seeps are considered sensitive communities because of their importance to serpentine-endemic plants and invertebrates and their limited regional distribution (ICF International 2012). In the Program Renewal Area, serpentine communities occur primarily on either side of the Santa Clara Valley, from Coyote Ridge to the east and the Santa Teresa Hills to the west south to the San Martin area. Smaller patches of serpentine grassland occur elsewhere, such as on Communications Hill, Tulare Hill, and north of Alum Rock Park in San Jose.

Seasonal wetlands are sensitive wetland habitats that experience seasonal wetland hydrology. Often these habitats are in depressions that collect surface runoff during storms in the rainy season, only ponding or exhibiting saturated soils for a number of weeks or months during the year. Other seasonal wetlands may be fed by seasonally high groundwater associated with seasonal seeps and intermittent streams. These habitats are sensitive because they provide important seasonal habitat for wetland species, and when wetted, wetland functions and values related to water storage, groundwater recharge, and maintenance of local water quality. Seasonal wetlands can vary greatly in terms of plant composition depending on their location, hydrologic regime, hydroperiod, and whether the source water and soils are brackish or fresh/neutral, but these habitats are dominated by hydrophytic plant species.

Central California sycamore alluvial woodland occurs along low, braided channels in areas with wide floodplains. The community is dominated by western sycamore trees with a sparse understory, and the substrate tends to be cobbly or gravelly and scoured frequently by spring run-off events. Although sycamore alluvial woodlands were once more broadly distributed in California, they have experienced severe declines due to development of Valley floor areas and alterations in hydrology at suitable sites, typically caused by flood protection improvements along drainages supporting sycamore stands. Sycamore alluvial woodland occurs sparsely in the Program Renewal Area, with the best examples of this community occurring along Coyote Creek between U.S. Highway 101 and the Ogier Ponds and along Pacheco Creek east of Gilroy.

Wildlife Movement and Habitat Connectivity

Habitat connectivity is vital to animals for maintaining connections between core habitat areas (i.e., larger intact habitat areas where species typically reside). Connectivity helps ensure that genetic diversity is maintained by allowing individuals to disperse and share genes between populations, thereby diminishing the probability of inbreeding depression,

and helps to maintain populations, as individuals from larger or more productive populations can disperse to areas where populations are lower. This helps to ensure that populations are more widely dispersed rather than being confined to fewer, more limited areas where disease, large disturbances such as extensive fires, or random events could cause extirpation (local extinction). Connectivity is especially important in landscapes fragmented by urban development and agricultural activities.

Streams and rivers in the Program Renewal Area function as corridors for wildlife movement. Aquatic species such as fish, aquatic invertebrates, stream amphibians, and northwestern pond turtles use streams to move throughout the landscape. Riparian vegetation associated with streams provides habitat for resident animals of a variety of taxa. Such vegetation provides connectivity within and among populations by allowing genes and individuals to move throughout stream systems as breeding occurs. In addition, riparian vegetation provides migratory stopover habitat for birds and provides cover for animals undergoing long-distance terrestrial dispersal. Other natural habitats (e.g., oak woodlands and scrub) throughout the Program Renewal Area also function as pathways for terrestrial wildlife movement that allow animals to move along these areas.

A variety of animals, including amphibians, reptiles, mammals, and birds, move in a northwest-southeast direction along the western edge of the Diablo Range foothills and the eastern edge of the Santa Cruz Mountain foothills in the Program Renewal Area. In addition, animals move in an east-west direction across Coyote Valley and along the Pajaro River between the Santa Cruz Mountains and the Diablo Range. East of Gilroy, additional linkages are identified from Henry W Coe State Park south to San Felipe Lake and San Benito County. The ability of animals to be able to move – either over generations, in the case of less mobile animals, or during long-distance dispersal events for birds, bats, and larger mammals – across Coyote Valley and intermix and breed with genetically unrelated members of the species is important to the maintenance of populations of many species in the Diablo Range and Santa Cruz Mountains. Coyote Valley represents the highest-quality linkage between these two mountain ranges because the foothills of both ranges come so close together at North Coyote Valley and because the mostly undeveloped nature of North Coyote Valley allows wildlife movement with limited impediments.

Nursery Sites

Nursery sites (i.e., areas with very high densities of breeding individuals) of native wildlife species in the Program Renewal Area are represented primarily by colonial nesting birds. Nesting colonies of great egrets, snowy egrets, great blue herons (*Ardea herodias*), and black-crowned night herons (*Nycticorax nycticorax*) occur along sloughs on the periphery of the San Francisco Bay as well as inland along streams and on pond and reservoir islands throughout the Program Renewal Area. From 1987–2005, approximately 19 great blue heron colonies were known from Santa Clara County, with 3–8 active colonies in a given year (Bousman 2007g). In addition, approximately nine colonies of great egrets, ten colonies of snowy egrets, and nine colonies of black-crowned night herons were active in various years from 1987–2005 in the Program Renewal Area (Bousman 2007h, Bousman and Strong 2007a, and Bousman and Strong 2007b). As of 2020, approximately 10 colonies of great blue herons, 12 colonies of black-crowned night herons, 12 colonies of great egrets, and 10 colonies of snowy egrets (many of which were the same colony supporting multiple species) were known from the Program Renewal Area (San Francisco Bay Bird Observatory 2020).

However, not all of these colonies have been active in recent years (S. Rottenborn, personal observation).

Few colonies of great blue herons persist in Santa Clara County for more than a few years, and few colonies exceed 5–10 nests (Bousman 2007g). Great blue herons typically nest in large trees in the Program Renewal Area, such as eucalyptus and cottonwood (Bousman 2007g). In contrast, great egrets, snowy egrets, and black-crowned night herons nest in more variable substrates such as eucalyptus trees, thick bulrushes, saltbush, and palm trees (Bousman 2007h, Bousman and Strong 2007a, and Bousman and Strong 2007b). Their colony sizes often consist of small numbers of nests, but can be larger, with counts of up to 40 nests of black-crowned night herons, 114 nests of snowy egrets, and 90 nests of great egrets (Bousman 2007h, Bousman and Strong 2007a, and Bousman and Strong 2007b).

3.4.4 Impact Analysis

Methodology

Impact Assessment

This impact analysis focuses on potential effects of maintenance activities on biological resources during the period from 2027 to 2036 based on existing baseline conditions in the Program Renewal Area, which on a broad scale are defined as the existing conditions at the time of the publication of the 2022 Notice of Preparation. On a finer scale, existing conditions are represented by the habitat conditions present in maintenance activity areas at the time that maintenance occurs. Maintenance activities have been ongoing regularly within many portions of the Program Renewal Area under Stream Maintenance Program 2002–2012 (SMP-1) and SMP-2, and these activities may influence the habitat conditions present at the time that maintenance activities occur. However, this analysis does not assume that Program Renewal Areas have been recently or previously disturbed (i.e., it is not assumed that ongoing SMP-2 disturbance is part of the baseline); rather, any influence of prior maintenance influences the magnitude of the Program Renewal impacts). Existing conditions in the Program Renewal Area are described in Section 3.4.3 above.

Potential Program Renewal impacts on biological resources were systematically evaluated both at the Program Renewal level and cumulatively. In the sections below, impacts are first evaluated without considering implementation of Program Renewal avoidance and minimization measures (i.e., Valley Water BMPs and VHP conditions) to describe qualitatively how Program Renewal activities could impact biological resources. Then, the significance of each impact is evaluated with application of the Program Renewal BMPs and VHP conditions (as applicable). For those impacts that remain significant even with implementation of Program Renewal BMPs and compliance with VHP conditions, feasible mitigation measures are identified, and the significance of the impacts is then re-evaluated to determine if compensatory mitigation reduces impacts to a less-than-significant level. Any impacts that remain significant with implementation of compensatory mitigation would be described as significant and unavoidable.

Biological resources in the Program Renewal Area may be affected not only by maintenance activities but also, in a few cases, by mitigation measures and Program Renewal BMPs. These mitigation measures and BMPs would, overall, reduce or avoid significant impacts; however, in a few cases, adverse effects may occur from implementation of the mitigation measures

and BMPs themselves. For example, although relocation of special-status fish, reptiles, and amphibians from work areas may be necessary to avoid mortality of those individuals, some injury or mortality may occur during relocation. As a result, the effects of the BMPs and the mitigation Program Renewal are also analyzed, where appropriate.

In general, the primary adverse effects of the Program Renewal on biological resources would occur at the time that maintenance activities take place, and during the period immediately following maintenance activities. Potential Program Renewal impacts are expected to include direct and indirect adverse effects on riparian, wetland, and instream habitats; effects on adjacent non-instream habitats (e.g., maintaining access routes); impacts on associated plant communities and wildlife species; and potential degradation of water quality. While many of these effects will be of short duration (e.g., where herbaceous vegetation will regrow following the impact), in some cases maintenance activities would result in longer-term effects. In addition, many short-term impacts will be repetitive, occurring a number of times during the 10-year period covered by the Program Renewal. For the purpose of this assessment, impacts are considered temporary if the vegetation, wetlands, and other waters that were affected would restore naturally if management were to cease. For the majority of the Program Renewal, the effects of maintenance activities would be largely temporary in any specific area. However, where Program Renewal activities occur in one location repeatedly and do not allow for regeneration of these resources, or where Program Renewal activities result in the permanent exclusion of vegetation or permanent conversion of existing natural areas to developed areas (e.g., by hardening banks), longer-term effects would result. Several characteristics of the Program Renewal and Program Renewal Area complicate the quantification of impacts to biological resources that would occur. These are as follows:

- A specific reach of creek may be subject to several types of activities, either simultaneously or in succession. For example, a reach may undergo sediment removal one year, followed by herbicide application the next year. Vegetation management activities also may target only instream areas, only non-instream areas (such as levees), or some combination of instream, bank/bench, and levee areas. The different combinations of maintenance activities that may occur along a specific reach of creek is not necessarily predictable, as many of these activities are performed on an as-needed basis.
- Valley Water has projected potential sediment removal activities along 141.4 miles of streams in the Program Renewal Area (26.7 miles within permanently mitigated area [PMAs]), aquatic herbicide application along 311.8 miles of streams (105.9 miles within PMAs), and vegetation removal (defined as the removal of vegetation, including trees <6" diameter at breast height [dbh]) along 311.8 miles of streams (71.9 miles within PMAs). However, these maintenance activities may not occur exactly where and to the extent they are projected. Experience from SMP implementation over the past two decades (i.e., the 2002–2012 SMP-1 and 2013–2023 SMP-2) indicates that some maintenance activities are likely to be required in areas where they are not currently projected (with much lower likelihood), and some reaches where activities are projected would not actually be subjected to maintenance. Furthermore, while the projected work locations illustrate the geographic areas where maintenance activities are most likely to occur, the total area in which SMP-1 and SMP-2 activities have occurred since 2002 has been substantially less than projected for each of those Program Renewals. Due to this,

as well as the biological avoidance and minimization measures that Valley Water implements through its BMPs, impacts from 2027–2036 Program Renewal activities are expected to be less extensive than projected.

- The Program Renewal projections include aquatic herbicide application and vegetation management (these two activities are projected to occur in the same locations) along 311.3 miles of streams, and sediment removal along 141.4 miles of streams. Within the projected work areas, the locations where each maintenance activity will occur are not specifically known. The locations and extent of maintenance activity impacts will ultimately be identified on an activity-by-activity basis as work is performed, and quantified and reported on an annual basis.

Given these complications, impacts of the Program Renewal on biological resources are estimated as accurately as possible and described qualitatively in order to support this assessment. The approach taken to estimate and describe Program Renewal impacts on biological resources in this analysis is as follows:

This analysis describes qualitatively the types of impacts on biological resources that could occur as a result of 2027–2036 Program Renewal activities.

Rather than providing specific quantitative measures of Program Renewal impacts on biological resources, this analysis broadly estimates the expected locations and potential magnitude (typically the maximum extent/amount) of potential Program Renewal impacts, based on (1) projections of sediment removal, in-stream vegetation management, and aquatic herbicide application activities during 2027-2036; (2) assumptions regarding the anticipated extent of impacts within the projected reaches, provided by Valley Water (provided as applicable with the estimated impact acreages in Tables 3.4–3.15 below); and (3) experience from the SMP-1 and SMP-2. Valley Water expects the extent of impacts from SMP-2 and Program Renewal maintenance activities to be similar, and less extensive than the extent of the Program Renewal projections. Significance determinations are based on the impact estimates made as described above, and the type of and need for compensatory mitigation has been determined accordingly.

Although the biological resources in some areas may have been affected by maintenance activities in the past, the discussion of the impacts that could result from Program Renewal activities is applied to biological resources in all impact areas, regardless of whether or not maintenance has recently occurred along a particular reach (i.e., the most conservative approach is assumed).

In-perpetuity mitigation has previously been provided within PMAs in the Program Renewal Area where impacts of certain maintenance activities occur repeatedly. The frequency and magnitude of Program Renewal impacts within PMAs varies, and while biological resources within some PMAs may be adversely affected by repeated impacts, biological conditions within many PMAs are minimally affected and are similar to areas located outside of PMAs. Thus, for the purpose of this assessment, it is conservatively assumed that biological conditions within and outside of PMAs are similar.

To estimate Program Renewal impacts on habitat for special-status species, the proportion of the projected work that falls within each species' range was calculated in geographic information systems (GIS) and used to scale the estimated impacts for the entire Program

Renewal Area (provided in Table 3.4 under "General Discussion of Impacts of Program Renewal Activities on Biological Resources" below) for that species.

In addition, a substantial proportion of maintenance activities will be scattered throughout impact areas and will be relatively limited in extent and/or infrequent. Prior to conducting maintenance activities, Valley Water conducts field inspections that inform where the maintenance activities need to be prioritized and targeted along a given reach. Valley Water then provides its best estimates of the extent of impacts within each reach based on an estimate of a more targeted approach, as opposed to working along the entire reach. As a result, impacts within the Program Renewal Area will typically not result in the complete removal of habitat areas; rather, temporary impacts, focused impacts in certain locations, and thinning of vegetation typify the majority of Program Renewal impacts.

Estimates of Program Renewal impacts on biological resources are provided under "Quantification of Impacts" below, as well as under individual impact sections (e.g., Impact BIO-1).

Mitigation Approach

Valley Water is the primary steward of the resources on its lands. Reflecting this, Valley Water's ends policy goals include "Use a science-based, inclusive approach to protect Santa Clara County's watersheds and aquatic ecosystems for current and future generations" and "Sustain ecosystem health while managing local water resources for flood protection and water supply." In alignment with this stewardship role, Valley Water conducts some Program Renewal activities that have the primary goal of ecological benefit. In some cases, these activities may also provide multiple benefits. This work may include, but is not limited to, activities such as invasive plant management, vegetation management for ecological health, and installation or modification of physical features to provide habitat function. The scale of work that Valley Water does under the Program Renewal for ecological benefit will depend on identification of need for this work, availability of staff time and budget, balance with other Valley Water goals, compliance with permit conditions, and other factors. However, there is potential for Valley Water to conduct ecologically beneficial work under the Program Renewal throughout all Valley Water lands that are covered by the Program Renewal. Because such activities are considered environmentally beneficial, they are not expected to require mitigation. Maintenance activities that are performed to meet the goals and objectives of a land management plan or revegetation site would also not require mitigation. In addition, the majority of sediment removal, in-stream herbicide application, and in-stream vegetation management will occur within existing PMAs. If in-perpetuity mitigation has already been provided for impacts of a particular activity along a given reach (e.g., in a PMA), no additional mitigation is required for conducting the same activity along that reach. However, mitigation may be required for conducting a different maintenance activity along that reach. For example, if mitigation was previously provided in perpetuity only for sediment removal along a given reach, no additional mitigation for sediment removal along that reach would be required, but mitigation for vegetation management activities along that reach would be necessary. PMA mitigation does not apply to Program Renewal impacts on special-status species or their habitats.

To determine mitigation needs, Valley Water will quantify Program Renewal impacts on biological resources, such as the acreage of impacts to wetlands and riparian habitats, sensitive communities, and special-status species' habitats, on an annual basis as work is

performed from 2027–2036. Valley Water will tally the impacts of Program Renewal activities for a specific year at the end of each year. These impact calculations will then be used as the basis for determining mitigation to be provided at either that year's end or the following year. This annual analysis will clearly distinguish where activities occurred (e.g., in a PMA versus in new areas for which mitigation is required).

For purposes of CEQA compliance, after implementation of Valley Water's BMPs (for all activities) and VHP conditions and fees (for VHP-covered activities), if residual impacts from maintenance activities remain significant, Valley Water will provide compensatory mitigation for impacts on biological resources via the following approach, as described in detail in Chapter 10 of the SMP Manual, to reduce impacts of Program Renewal activities to less-than-significant levels, where feasible:

- The majority of Program Renewal impacts that require mitigation will be covered under the VHP once it is amended. Impacts of VHP-covered activities will be mitigated via the payment of VHP fees and compliance with VHP conditions. The USFWS and CDFW have approved VHP compliance (including payment of VHP impact fees) as providing adequate mitigation for impacts of VHP-covered activities on VHP-covered species. The USACE and RWQCB have approved the VHP In Lieu Fee Program to allow for impacts to waters of the U.S. and waters of the state to be mitigated by payment of VHP impact fees by applicants and creation and restoration of appropriate aquatic, wetland, and riparian land cover types by the Habitat Agency. The VHP specifically sets biological goals for land cover types that constitute jurisdictional resources and serves as both an approved In Lieu Fee Program and as a landscape and watershed-level framework for compensatory mitigation for impacts to jurisdictional waters.
- Certain Program Renewal activities will not be covered under the VHP. These are aquatic herbicide application, activities located within tidal areas (which are located outside of the VHP permit area), and Program Renewal activities that occur within the time before the VHP amendment is approved. Impacts of Program Renewal activities on fish are also not covered under the VHP. Valley Water proposes to mitigate impacts of non-VHP covered activities as follows:
    - The need to provide mitigation for impacts due to habitat removal from herbicide application will be assessed on a case-by-case basis. All but 9 acres, or 1.6 percent, of estimated herbicide impacts would occur in PMAs where mitigation has already been provided (Table 3.4-5). Based on experience from SMP-2, Valley Water anticipates that the majority of the 9 acres of herbicide-related impacts located outside of PMAs will be beneficial and, as discussed above, mitigation would not be required. For example, aquatic herbicide application may be used to maintain emergent vegetation by removing willow saplings or invasive plants. Aquatic herbicide application may also be applied only to very limited areas within an extensive area of habitat such that no substantive habitat removal or type conversion (and therefore no substantive impact) occurs. A substantial adverse effect would only occur if aquatic herbicide application results in a substantial reduction in habitat quality for wildlife, particularly due to the loss of high-quality wildlife habitat, in the opinion of a qualified biologist. As discussed in Chapter 4 of the SMP Manual, a biologist will evaluate areas targeted for herbicide application to identify any concerns

about the potential reduction in habitat for sensitive species. If the biologist determines based on the vegetation removed relative to the remaining vegetation that the use of aquatic herbicide has resulted in a substantial reduction in high-quality habitat, Valley Water will provide mitigation for this activity at a 1:1 (impact:mitigation) ratio on an acreage basis via trash cleanup or seeding the vegetation removal area with an appropriate seed mix.

- To mitigate impacts due to the loss of habitat from in-stream vegetation management and sediment removal activities (i.e., activities for which PMAs are proposed), Valley Water will acquire and conserve land and/or utilize existing mitigation credits through the establishment of PMAs as its primary approach. Most Program Renewal impacts that occur outside of existing PMAs will be limited in extent and not repeated in the same location, and new PMAs would not be created for such impacts (rather, they would be mitigated via one of the other options listed here, as appropriate). New PMAs will be created for areas where maintenance activities occur repeatedly at the same location (e.g., at a bridge crossing); such locations will be identified as the Program Renewal is implemented. This PMA mitigation will not be used to mitigate Program Renewal impacts on state and federally listed species or their habitats (discussed separately below).
- Because establishing new PMAs will be a work in progress at the start of the Program Renewal, Valley Water will initially provide mitigation for impacts due to the loss of habitat from in-stream vegetation management and sediment removal activities on an annual basis based on annual impact estimates, which will later be trued-up based on actual impacts. This is consistent with the SMP-2 mitigation approach. During this period, compensatory mitigation will be provided using on-site and off-site ecological services-based mitigation consisting of native plant revegetation, removal of trash and pollutants from encampments, and rehabilitation of encampment-related excavated banks.
- Impacts of maintenance activities for which PMAs are not proposed (i.e., bank stabilization, management of animal conflicts, and certain minor maintenance activities) will be mitigated on an as-needed basis using defined mitigation ratios as maintenance activities occur. Mitigation options for these activities are as described in the bullet above (i.e., on-site and off-site ecological services-based mitigation and use of remaining credits).
- Impacts of maintenance activities on nontidal regulated habitats including wetlands, other waters, and riparian habitats may be mitigated via the payment of fees to the Habitat Agency via the Habitat Agency's Voluntary Fee Payments Policy. This option is subject to consistency with VHP requirements and Habitat Agency approval, and contingent on the Habitat Agency agreeing to use Valley Water's fees to provide mitigation for the resource being impacted (e.g., wetlands, aquatic habitats, or riparian habitat).
- Direct impacts on state and federally listed species that are not covered under the VHP, including fish, will be avoided and minimized through

implementation of BMPs. Any residual impacts of non-VHP-covered Program Renewal activities will be mitigated via (1) gravel augmentation, construction of instream complexity (for fish); (2) payment of fees to the Habitat Agency via the Habitat Agency's Voluntary Fee Payments Policy (for impacts on species covered by the VHP and their habitats), or (3) land acquisition-based and habitat creation mitigation, including future projects and use of remaining credits from completed mitigation projects.

- As mitigation for impacts to tidal habitats and tidal marsh species was predicted to result from the 2002–2012 SMP, Valley Water restored the "Island Ponds" (Ponds A19, A20, and A21), located between Coyote Slough and Mud Slough near Alviso, to tidal action. Monitoring has documented the formation of tidal marsh habitat, including extensive channel networks, within these ponds. Thirty acres of tidal restoration within the Island Ponds was intended to serve as mitigation for impacts to tidal habitats for the 2002–2012 SMP. However, based on the actual impacts from 2002–2012 SMP activities, only 9 acres of tidal mitigation was needed to compensate for those impacts. An additional 1,407 square feet (<0.1 acre) of tidal mitigation was needed to compensate for impacts from 2012-2024 SMP activities. Therefore, more than 8.9 acres of restored tidal marsh are available to mitigate tidal impacts from Program Renewal activities. Valley Water will debit any tidal habitat mitigation needs for Program Renewal activities from the remaining acreage of tidal restoration at the Island Ponds.

Annual reports summarizing Program Renewal impacts and associated mitigation needs will be prepared by Valley Water for documentation of compliance with CEQA mitigation requirements, and also for submittal to applicable resource agencies such as the USFWS, NMFS, CDFW, USACE, RWQCB, BCDC, and Habitat Agency.

Mitigation Feasibility Assessment, Monitoring, Reporting, and Success Criteria

Mitigation Feasibility Assessment

The success criteria for revegetation mitigation projects would carefully consider existing site conditions and constraints. The Mitigation Feasibility Assessment (MFA) Field Protocol (*Appendix F*) process described herein was designed to provide a consistent assessment methodology that can guide mitigation design and success criteria based on what type, degree, and quality of revegetation the site will support.

The MFA process begins with a broad evaluation of the existing conditions at the mitigation site. Depending on the activity and on-site conditions, the target mitigation site may be at the same location where the work will occur, or it may occur at an off-site location. The MFA assessment includes evaluating site hydrology, flow velocity, soils and soil moisture, aspect, slope, adjacent land use, site access, presence of invasives, presence of rare/listed species, maintenance needs, animal damages, human activity, and the potential revegetation design. Based on this assessment, the site is categorized as having either a high, medium, or low revegetation potential. Each of these categories is based on the presence or absence of existing opportunities and constraints at the site. Planting species appropriate to the site conditions can promote a more successful and efficient revegetation Program Renewal. If a site is identified as having poor conditions yet is still desirable to plant, lower success

criteria will be established to account for the poorer site conditions. This will enable some replanting prior to seeking off-site mitigation. If the MFA identifies the work location as a highly constrained site, then off-site mitigation will be considered to ensure greater revegetation success.

The MFA process is designed to provide ecologically feasible mitigation success criteria, given site specific conditions and the proposed revegetation palette. Valley Water may support revegetating a highly constrained creek bank that will rarely meet typical success criteria. Therefore, lower success criteria will be allowed to facilitate replanting on ecologically challenging sites. Project sites with fewer constraints will meet standard success measures more easily and will continue to be held to those higher standards.

MITIGATION MONITORING

All monitoring Program Renewals are intended to be adaptively managed and implemented in conjunction with input and support from regulatory agencies.

Monitoring Protocols

Since the SMP inception in 2002, Valley Water has developed surveying and monitoring protocols as part of the routine implementation of the SMP. Valley Water conducts annual field inspections of their streams to determine the needs for maintenance activities. Valley Water tracks all maintenance activities conducted by stream reach, and all restoration and mitigation efforts implemented to address maintenance impacts. Valley Water maintains an extensive database, including a GIS mapping database, to document and track annual maintenance and mitigation activities. Valley Water's existing monitoring protocols and corresponding databases will meet the monitoring needs of the updates to the mitigation for the Program Renewal as described in the MFA. For proposed new mitigation efforts not directly addressed by an existing monitoring protocol (or entry into the existing database system), Valley Water will expand the database and develop monitoring protocols.

Monitoring for species-specific mitigation projects will be conducted as directed by regulatory permit conditions and guidance provided in BOs.

Duration of Revegetation Mitigation Monitoring

Monitoring revegetation mitigation project sites that involve restoration plantings will be conducted for five (5) years following planting, or until success criteria are met. Success criteria will be determined though the MFA as described above. Information collected on restoration plantings will include the number and species planted at each site, square footage of area planted, estimated percent canopy cover, number or percent of planted trees and shrubs surviving, and observations on whether recolonization of invasives occurs after removal. Note that percent cover canopy will not be reported likely until year 5 or at which time canopy has developed significantly enough to describe.

Instream complexity and gravel augmentation projects will be monitored annually up to five years, to evaluate and describe their functioning.

Success Criteria for Plantings

Success criteria for shrubs and trees planted in riparian areas will be determined though the MFA process. In the event of poor plant survival, corrective measures will include replanting to reach the pre-determined success criteria, via the MFA, as needed based on scheduled monitoring activities. Such remedial measures will be monitored for a 5-year period following implementation to ensure that the project is successful. For instance, if remedial activities were taken during the fifth year after project implementation, monitoring of these remedial measures would continue until year 10. If they did not meet performance criteria at that point, additional measures would be required or new mitigation would be provided elsewhere should a project not be capable of meeting performance criteria.

Success criteria for riparian planting and revegetation projects are described in the MFA implementation document (*Appendix F*).

Mitigation Reporting

Mitigation planning, design, implementation, and monitoring activities will be notified and reported to the relevant permitting agencies through the course of the regular Program Renewal communications, including submittal of the Program Renewal annual Notice of Proposed Work (NPW) and Post-construction Report (PCR). These reports will include a discussion of mitigation activities associated with the Program Renewal.

Mitigation information to be included in the NPW will include a description of mitigation activities planned for the coming year including locations, lengths, areas, and other project details. The NPW will also include a schedule for implementing mitigation activities and a statement describing the status of permit approvals necessary to perform project (if applicable). As needed, reporting for land acquisition and restoration projects will include a description of how the proposed off-site mitigation will address Program Renewal related impacts.

Permitting agencies will have the opportunity to review and comment on the proposed annual mitigation plan. The Program Renewal annual mitigation plan will be consistent with the mitigation approaches and requirements described in this document and the SMP Manual.

Each year, Valley Water will submit a PCR on Program Renewal activities including summary descriptions of the maintenance activities conducted in the past year. The annual report will also include status reporting on the Program Renewal's mitigation activities, including the submittal of follow up monitoring reports from previous mitigation projects. The mitigation activity section of the PCR will include a comparison with success criteria and describe efforts to meet those criteria. Individual tree replacement planting for the removal of 6-12 inch dbh trees will be reported annually through the PCR.

Reporting requirements will apply according to the duration of monitoring requirements, as described above. Once projects have fulfilled the 5-year monitoring requirement and meet the appropriate success criteria, they would no longer need to be reported in the annual PCR.

Criteria for Determining Significance

Based on Appendix G of the CEQA Guidelines, the Program Renewal would result in a significant impact on biological resources if it would:

A. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;

B. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;

C. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

D. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

E. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or

F. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Specifically, the significance criteria used for the analysis of impacts on biological resources are:

- Under Criterion A, have substantial adverse effects on special-status species, as follows (Impact BIO-1):
  - Special-status plants and invertebrates (Impacts BIO-1A through BIO-1C)
  - Special-status vertebrates (Impacts BIO 1-C through BIO-1Y)
  - Non-special-status animals (Impact BIO-1Z)
- Under Criterion B, have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW or USFWS, as follows (Impact BIO-2):
  - Riparian habitat (Impact BIO-2A)
  - Other sensitive plant communities (Impact BIO-2B)
- Under Criterion C, have a substantial adverse effect on state or federally protected wetlands, as follows (Impact BIO-3):
- Under Criterion D, result in substantial interference with wildlife movement or use of native wildlife nursery sites (Impact BIO-4)

- Under Criterion E, result in any conflict with local policies or ordinances protecting biological resources (Impact BIO-5)
- Under Criterion F, result in any conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or State HCP (Impact BIO-6)

General Discussion of Impacts of Program Renewal Activities on Biological Resources

The following sections describe generally how Program Renewal activities may impact biological resources within the Program Renewal Area. For some impacts, more detail is provided here than in the individual impact discussions that appear later in this section (i.e., Impact BIO-1, BIO-2, etc.) to reduce redundancy. For example, the general discussions of how Program Renewal activities may affect birds apply to the impact sections for the least Bell's vireo, yellow warbler, yellow-breasted chat, burrowing owl, golden eagle, bald eagle, and other birds. Thus, these general discussions are referenced in each impact section to reduce redundancy; those impact sections then provide additional detail regarding impacts on each biological resource, as appropriate.

A general discussion of impacts of the Program Renewal on each resource type (e.g., sensitive habitats, plants, and wildlife) is provided below for each Program Renewal impact type, with the exception of minor maintenance activities and downed tree management, as follows:

- Minor maintenance activities, which are described in Section 2.5.6, may occur throughout the Program Renewal Area, and greater than 100 minor maintenance activities currently occur each year. Any minor maintenance activity typically would affect only a very limited area and, therefore, impacts on biological resources likewise typically would be limited in extent. Minor maintenance activities would have impacts similar to those that would result from other categories of Program Renewal activities (i.e., bank stabilization, sediment removal, vegetation management, and management of animal conflicts), but at a much smaller scale. Therefore, the discussions of how bank stabilization, sediment removal, vegetation management, and management of animal conflicts would affect biological resources pertain to similar minor maintenance activities.
- Downed tree management includes activities that are similar to vegetation management, such as cutting and removal of (downed) trees and access with heavy equipment and/or mechanized equipment. Therefore, the discussions of how vegetation management would affect biological resources pertain to similar minor maintenance activities. However, downed tree management activities also include activities related to large woody debris, including retention (e.g., to benefit fish habitat or channel stability), modification or repositioning (e.g., to avoid flood risk, debris trapping, or erosion), or removal (e.g., due to flood risk or risks to facilities, or to facilitate fish passage). Activities related to large woody debris are discussed with respect to impacts on fish in the *Vegetation Management* sections below.

Impact Estimates

Valley Water has estimated the acreages of direct impacts of sediment removal, vegetation management, aquatic herbicide application, and bank stabilization on upland, riparian,

aquatic, and wetland communities as described under "Impact Assessment" above. These estimates are provided in Table 3.4-5 and Table 3.4-6. Table 3.4-5 provides the total estimated impact acreages for upland, riparian, aquatic, and wetland communities over the 2027-2036 Program Renewal term, while Table 3.4-6 provides the estimated impact acreages for sensitive natural communities within those areas (i.e., the impacts provided in Table 3.4-5 are included in the total impacts provided in Table 3.4-5). A 25 percent buffer has been added to permanent vegetation management impact estimates to account for the hazard tree Program Renewal, and a 10 percent buffer has been added to all other impact estimates, to ensure that these estimates are conservative and encompass all Program Renewal activities. Based on experience from SMP-1 and SMP-2, these estimates are likely higher than the impacts that will actually result from Program Renewal activities. The following assumptions apply to the estimates provided in Table 3.4-5:

- The v*egetated wetlands* category encompasses a variety of herbaceous wetland plant communities, including but not limited to emergent wetlands with tall-statured species such as cattail and bulrush as well as lower-stature species such as watercress (*Nasturtium officinale*) and smartweed. These areas would be mapped as the coastal and valley freshwater marsh or seasonal wetland land cover by the VHP within nontidal areas, and as tidal salt marsh or tidal brackish marsh within tidal areas.
- The *aquatic habitat* category refers to unvegetated areas below the ordinary high-water mark, regardless of whether they contain any above-ground water at the time work is performed. These areas would be mapped as riverine land cover by the VHP within nontidal areas, and as tidal or intertidal within tidal areas.
- The *herbaceous streambank* category refers to herbaceous species that primarily consists of non-woody, ruderal vegetation growing between the ordinary high-water mark and top of bank along a stream. These areas may be mapped as the California annual grassland by the VHP.
- The *woody riparian* category refers to woody vegetation in riparian areas, including VHP riparian forest and scrub land cover types such as willow riparian forest and scrub, central California sycamore alluvial woodland, and mixed riparian forest and woodland. Impacts to this vegetation associated with aquatic herbicide application are generally due to the treatment of small saplings, primarily small willow saplings.
- The *other (non-developed uplands)* category refers to upland land cover types located above the top of bank such as grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

The following assumptions apply to the estimates provided in both Table 3.4-5 and Table 3.4-6:

- Impacts from sediment removal, vegetation management (i.e., the removal of vegetation, including trees <6" dbh), and aquatic herbicide activities are typically temporary. This is reflected in Tables 3.4-5 and 3.4-6, where 100 percent of these activities are classified as temporary.
- The estimates in Tables 3.4-5 and 3.4-6 do not include ecologically beneficial actions (e.g., the removal of invasive vegetation, management of vegetation for fire resilience, restoration site maintenance, vegetation management for ecological

health, , and management of vegetation for fire resilience). Beneficial actions are described and assessed qualitatively in this section, rather than quantitatively.

- Management of animal conflicts, minor maintenance activities, and upland herbicide application are not explicitly listed in Tables 3.4-5 and 3.4-6 because impacts of these activities are limited in extent and are not tracked on an activity-specific basis by Valley Water. However, the conservative estimates in Table 3.4-5 (which were calculated by applying conservative buffers, as described above) are expected to encompass all impacts of these activities.
- In cases where the same geographic location is impacted multiple times, those impacts are counted multiple times rather than as a single impact. For example, if hand removal of vegetation occurs within the same 1 acre of wetland vegetation five times during the course of the Program Renewal, this impact is counted as 5 acres rather than as 1 acre.

1 Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed in Table 3.4-5 are encompassed within the conservative estimates provided.

2 All impacts of sediment removal, vegetation management (<6" dbh), and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions not long after maintenance is complete.

3 No PMAs are established for tree removal, mechanical mowing, or hand weed abatement.

4 Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

5 PMA = Previously Mitigated Area.

6 All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

The percentage of maintenance activities that occur within or outside of a PMA varies by activity, as follows:

- For all Program Renewal activities (Table 3.4-5), the majority of projected sediment removal (71.4 percent), aquatic herbicide application (98.4 percent), and vegetation management (i.e., the management of vegetation <6" dbh) (71.1 percent) that will occur under the Program Renewal is located within existing PMA reaches for which in-perpetuity mitigation has previously been provided (Table 3.4-5). These proportions are consistent with SMP-2. Therefore, although all impacts are evaluated as part of this assessment, only a fraction of the estimated impacts in Tables 3.4-5 and 3.4-6 will be located outside of PMAs and necessitate mitigation.
- For sensitive natural communities (Table 3.4-6), 100 percent of impacts on 5 acres of oak woodlands would occur outside of PMAs, 50 percent of impacts on 10 acres of northern coastal salt marsh would occur outside of PMAs, 50 percent of impacts on 4 acres of seasonal wetlands would occur outside of PMAs, and 67 percent of impacts on 3 acres of sycamore alluvial woodland would occur outside of PMAs.
- There are no PMAs for bank repair or the removal of trees >6" dbh; therefore, impacts of those activities will necessitate mitigation.

Table 3.4-6. Estimated 2027–2036 Total[1] Impact Acreages for Sensitive Natural Communities[4]

	Sediment Removal[2] (acres)		Aquatic Herbicide Application[2] (acres)		Vegetation Management (<6" dbh)[2] (acres)		Tree Removal (>6" dbh) (acres)	Bank Repair (acres)		
Community and Land Cover	In PMA[3] Temporary	Outside PMA Temporary	In PMA Temporary	Outside PMA Temporary	In PMA Temporary	Outside PMA Temporary	Outside PMA Permanent	Outside PMA Temporary	Outside PMA Permanent	Total
Oak Woodlands	0	0	0	0	0	2	<1	<1	<1	5

Seasonal Wetlands	0	0	<1	<1	<1	<1	0	0	0	4
Sycamore Alluvial Woodland	0	0	0	0	<1	<1	<1	0	0	3

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of maintenance activities not specifically listed are encompassed within the conservative estimates provided. Mechanical mowing and hand weed abatement do not occur in sensitive natural communities under the Program Renewal.

[2] All impacts of sediment removal, vegetation management (<6" dbh), and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] PMA = Permanently Mitigated Area.

[4] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

Valley Water applies pre-emergent and post-emergent herbicide treatments to control growth of weeds in places like maintenance roads, access ramps, paths, fence lines, and other facilities that must be kept clear of vegetation to maintain their function. These are generally locations with developed and maintained facilities where the application of herbicide to control growth of weeds does not result in a habitat type conversion. Valley Water estimates that upland herbicide application will occur within approximately 677 acres of the Program Renewal Area annually. All 677 acres will be treated with post-emergent (i.e., after plants emerge) for spot treatment of existing plants. In addition, approximately 588 acres of the 677 acres will also be treated with pre-emergent (i.e., before plants emerge) herbicide application to stop the emergence of plants. Therefore, these impacts are not included in the impact estimates for special-status species and their habitats under Impact BIO-1 below.

Impacts on Sensitive Natural Communities

This section describes the general impacts of each Program Renewal activity type on sensitive natural communities in the Program Renewal Area as defined under the "Sensitive Natural Communities, Vegetation Alliances, and Habitats" discussion above. Such communities include some areas/habitats that are considered jurisdictional waters of the U.S., waters of the state, or CDFW-jurisdictional habitats, such as seasonal wetlands, coastal and valley freshwater marsh, northern coastal salt marsh, and riparian habitats (including) central California sycamore alluvial woodlands, as well as non-jurisdictional communities such as oak woodlands and serpentine plant communities.

IMPACT TYPES

Program Renewal activities may affect sensitive natural communities through the direct or indirect disturbance of vegetation and the disturbance, modification, or destruction of habitat. The types of potential impacts that are considered in this evaluation, grouped by maintenance activity type, are described below.

Bank Stabilization

Bank stabilization activities (e.g., site preparation, recontouring and treatment installation, earth and soil compaction and grading, vegetation planting, and other restoration activities) may result in direct and indirect impacts on sensitive plant communities, as well as subsequent changes in hydrology that alter the extent of wetland and aquatic communities present at a work location. Vegetation may be lost as a result of mechanical or physical clearing of work and access areas, and damage to vegetation may occur as a result of crushing by equipment, trampling by personnel, and compaction of soil, which could result in damage to plant roots. Some bank stabilization activities would require temporary water diversions or dewatering. This activity would result in the temporary loss of aquatic and wetland communities and may result in increased turbidity within and downstream from the footprint of the activities caused by mobilization of fine sediments. In addition, because barren slopes are more susceptible to erosion from incident rainfall, the loss of wetland vegetation and non-instream vegetation along stream banks following bank stabilization activities may result in an increase in erosion and sedimentation. This in turn may lead to the filling in of pools and damage to wetland vegetation. Bank stabilization also may affect downstream areas by altering flow patterns.

Permanent loss of sensitive communities may occur where banks are repaired with hard materials (e.g., rock base or concrete) and not revegetated following stabilization. Any clearing of oak trees or riparian tree species in support of bank stabilization activities would result in the loss of key habitat features in sensitive communities. Mobilization of dust would affect plants in sensitive communities immediately adjacent to or downwind from areas of earth-moving or equipment/vehicle activity. Dust may coat vegetative and floral surfaces, interfering with normal gas exchange, photosynthesis, or pollination. The unintentional introduction of nonnative species and/or pathogens during bank stabilization activities can also harm these communities and reduce their extent and overall health. Such impacts may lead to the alteration of the communities' species composition, structure, and function.

Maintenance activities (including bank stabilization) often include on-site refueling of equipment. Minor fuel and oil spills may occur during refueling, with a risk of larger releases. Without rapid containment and clean up, these materials may enter streams where they would kill or impair the health of wetland plants.

Sediment Removal

Because sediment removal would be limited to the stream channel, direct disturbance to upland plant communities would occur primarily through the establishment of staging and access areas adjacent to work locations. The operation of equipment in non-instream areas during sediment removal activities also may result in impacts to sensitive upland plant communities, similar to those described for bank stabilization activities above.

As sediment is removed, so is any vegetation that is growing on it, including freshwater and tidal wetland vegetation. Removal of wetland vegetation may result in the loss of propagules for colonization of downstream areas. Additionally, similar to bank stabilization, some sediment removal activities would require temporary water diversions or dewatering. This activity would result in the temporary loss of aquatic and wetland communities and may result in increased turbidity caused by mobilization of fine sediments. Wetland vegetation also may be damaged by equipment accessing sediment removal sites.

Valley Water studies have found that wetland vegetation in some areas often quickly re-establishes following sediment removal. The *Instream Wetland Vegetation Regrowth Study* (Rankin and Hillman 2000) found 65 percent and 98 percent average regrowth within 1 and 2 years, respectively, after 1997 sediment removal at six non-tidal freshwater study sites. Average regrowth on two tidal study sites was less, at 21 percent and 29 percent after one and two years, respectively. The pattern of rapid re-establishment, with greater rates in non-tidal than in tidal areas, was supported by regrowth study results on four additional 1998 sediment removal sites. After one year, those sites supported more non-tidal wetland than was present before sediment removal and almost 70 percent of the tidal wetland that was present before sediment removal.

Vegetation Management

Vegetation management in upland areas would result in the direct removal of vegetation via hand tools, mechanized hand tools, mowing, tree removal, pruning or coppicing, grazing, and herbicide application. Such activities may impact sensitive upland plant communities as a result of mechanical, physical, or chemical (i.e., herbicide) removal of vegetation, which could result in the alteration of the communities' species composition, structure, and

function. In addition, the creation of temporary access routes and staging areas may result in direct impacts on sensitive upland plant communities caused by mechanical or physical removal of vegetation, crushing by equipment, trampling by personnel, compaction of soil, and alteration of hydrology through compaction or alteration of surface drainage patterns resulting from movement of heavy equipment or soil disturbance.

Instream vegetation management would result in the direct removal of vegetation, often including wetland vegetation, as well as the application of herbicides to targeted vegetation (i.e., herbaceous, invasive, emergent, or small woody vegetation <2 inches diameter at breast height [dbh]) within wetland areas. This work is most often performed to support flow conveyance, but may also consist of hazard tree removal, restoration site maintenance, invasive plant control, and/or maintenance to promote the overall ecological health of a stream. Vegetation removal could result in increased scour caused by the loosening of sediment deposits, not only as a result of the removal of vegetation but also from accelerated flows. In addition, as described for bank stabilization above, vegetation management would result in the temporary loss of aquatic and wetland communities and may result in increased turbidity caused by mobilization of fine sediments. Wetland vegetation also may be damaged by equipment accessing maintenance sites.

Vegetation management activities performed by Valley Water can also have beneficial effects on sensitive natural communities. These beneficial activities may include invasive plant management and vegetation management for ecological health. Some vegetation management activities may also be extremely limited in extent such that no substantive impacts due to habitat removal or type conversation occurs (i.e., activities may have a neutral impact).

Management of Animal Conflicts

Animal conflict management activities may impact sensitive upland plant communities as a result of the disturbance of the soil surface, collapsing and filling of burrows, installation of surface treatments to inhibit burrowing, and control of burrowing mammal populations that are a component of some sensitive upland communities, such as oak woodlands. Impacts may include direct removal or damage of vegetation; compaction of soil, which could result in damage to plant roots; trampling by personnel; alteration of hydrology through compaction or alteration of surface drainage patterns; and exposure to toxic chemicals (e.g., petroleum products). Installation of surface treatments to inhibit burrowing by mammals also may affect sensitive communities in the treated area, and control of populations of burrowing mammals may adversely affect the disturbance regimes of those communities. Vegetation management activities associated with the management of animal conflicts would have similar effects to those described under “Vegetation Management” above.

Discharge of sediments into the channel as a result of ground-disturbing activities on levee surfaces (e.g., filling or compacting of crevices/holes) may result in the filling of pools as well as adverse effects on wetland vegetation. Regrading and recompacting the levee surface, as well as the installation of surface barriers, may require the removal of vegetation or may limit new vegetation growth caused by soil compaction and loss of accessible surface growing space. Vegetation management activities would have similar effects to those described under *Vegetation Management* above.

EVALUATION OF IMPACTS

Impacts are evaluated in this analysis by comparing the quality of sensitive communities present in the Program Renewal Area under baseline conditions to anticipated conditions after implementation of the stream maintenance activities. For this evaluation, impacts on sensitive communities were assessed based on the potential for disturbance, degradation, and/or loss of these communities as a result of Program Renewal activities.

Impacts on Special-Status Plants

This impact assessment was developed using general life history and habitat requirements for special-status plants, and considers how each Program Renewal activity type may affect each of the special-status plants identified as potentially occurring in the Program Renewal Area, as well as additional CNPS-listed CRPR 1, 2, 3, or 4 species that may be discovered in the Program Renewal Area in the future.

IMPACT TYPES

Program Renewal activities may affect special-status plants through direct or indirect disturbance of individuals and populations as well as disturbance, modification, or destruction of suitable habitat. The types of potential impacts that are considered in this evaluation, grouped by maintenance activity type, are described as follows.

Bank Stabilization

Bank stabilization activities (e.g., site preparation, recontouring and treatment installation, earth and soil compaction and grading, vegetation planting, and other restoration activities) may result in direct and indirect impacts on special-status plants. Individual plants may be lost as a result of mechanical or physical clearing of work and access areas, crushing by equipment, trampling by personnel, and compaction of soil. These activities could result in death, altered growth, or reduced seed set through physically breaking, crushing, wilting, or uprooting plants. Permanent loss of special-status plants and their habitat would occur where banks are repaired with hard materials (e.g., rock base or concrete) and not revegetated following stabilization. Grading and the removal or redistribution of soil may remove seed of special-status plant species from the work area. Mobilization of dust would affect special-status plants located immediately adjacent to or downwind from areas of earth-moving or equipment/vehicle activity. Dust may coat vegetative and floral surfaces, interfering with normal gas exchange, photosynthesis, or pollination. The unintentional introduction of nonnative species and/or introduction or mobilization of pathogens such as *Phytophthora* during bank stabilization activities can also harm special-status plants, potentially leading to the spread of invasives and/or infection of adjacent occurrences of special-status plants outside the work area. Invasive plants could reduce habitat quality for special-status plants, or directly impact their health, in areas within and immediately outside impact areas. *Phytophthora* could impair the health of plants, spreading through root systems and resulting in the loss of individuals.

Furthermore, maintenance activities (including bank stabilization) often include the on-site refueling of equipment. Minor fuel and oil spills may occur during refueling, with a risk of larger releases. Without rapid containment and clean up, these materials may kill or impair the health of special-status plants.

Sediment Removal

As sediment is removed, so is any vegetation that is growing on it, including special-status plant species and their seeds. Individual plants may be lost as a result of mechanical or physical clearing of work and access areas, crushing by equipment, trampling by personnel, and compaction of soil. These activities could result in death, altered growth, or reduced seed set through physically breaking, crushing, wilting, or uprooting plants. The operation of equipment in non-instream areas during sediment removal activities may similarly damage to special-status plants. The unintentional introduction of nonnative species and/or introduction or mobilization of pathogens such as *Phytophthora* during sediment removal activities can also harm special-status plants, potentially leading to the spread of invasives and/or infection of adjacent occurrences of special-status plants outside the work area. Invasive plants could reduce habitat quality for special-status plants, or directly impact their health, in areas within and immediately outside impact areas. *Phytophthora* could impair the health of plants, spreading through root systems and resulting in the loss of individuals.

Furthermore, maintenance activities (including sediment removal) often include on-site refueling of equipment. Minor fuel and oil spills may occur during refueling, with a risk of larger releases. Without rapid containment and clean up, these materials may kill or impair the health of special-status plants.

Vegetation Management

Vegetation management activities result in the direct removal of vegetation, potentially including special-status plants, via hand tools, mechanized hand tools, mowing, tree removal, grazing, and herbicide application. Such activities may result in the direct damage and mortality of special-status plant individuals or populations as a result of mechanical or physical removal of vegetation, or off-target herbicide contact via drift. In addition, the creation of temporary access routes and staging areas may result in direct impacts on special-status plants due to mechanical or physical removal of vegetation, crushing by equipment, trampling by personnel, compaction of soil, and alteration of hydrology through compaction or alteration of surface drainage patterns resulting from movement of heavy equipment or soil disturbance. The unintentional introduction of nonnative species and/or introduction or mobilization of pathogens such as *Phytophthora* during vegetation management activities can also harm special-status plants, potentially leading to the spread of invasives and/or infection of adjacent occurrences of special-status plants outside the work area. Invasive plants could reduce habitat quality for special-status plants, or directly impact their health, in areas within and immediately outside impact areas. *Phytophthora* could impair the health of plants, spreading through root systems and resulting in the loss of individuals.

In addition, the creation of temporary access routes and staging areas may result in direct impacts on special-status plant species as a result of mechanical or physical removal of vegetation; trampling by personnel and equipment; compaction of soil caused by movement of heavy equipment or soil disturbance; removal of propagules for colonization of other areas; and exposure to toxic chemicals (e.g. petroleum products).

Vegetation management activities performed by Valley Water can also have beneficial effects on sensitive natural communities. These activities may include invasive plant management and vegetation management for ecological health.

Management of Animal Conflicts

Animal conflict management activities may impact special-status plants as a result of the disturbance of the soil surface, collapsing and filling of burrows, installation of surface treatments to inhibit burrowing, and control of burrowing mammal populations in areas where special-status plants are present. Impacts may include direct removal or damage of vegetation; compaction of soil, which could result in damage to plant roots; trampling by personnel; alteration of hydrology through compaction or alteration of surface drainage patterns; and exposure to toxic chemicals (e.g., petroleum products). Installation of surface treatments to inhibit burrowing by mammals also may affect special-status plants in the treated area, and control of populations of burrowing mammals may adversely affect the disturbance regimes of plant communities that support special-status plants. Vegetation management activities performed in support of animal conflict management would have similar effects to those described under "Vegetation Management" above.

Evaluation of Impacts

Impacts on special-status plants are assessed based on the potential for individuals or populations, and/or occupied habitat, to be disturbed, degraded, or lost as a result of Program Renewal activities. Impacts on special-status plants are evaluated by comparing the quantity and quality of habitat present in the Program Renewal Area under baseline conditions to anticipated conditions following implementation of Program Renewal activities, and by considering the potential for individual activities to affect known and potentially occurring populations of these species.

Impacts on Common and Special-Status Fish and Wildlife

The impact assessment for common and special-status fish and wildlife was developed using general life history and habitat requirements for each of the five vertebrate classes (i.e., fish, amphibians, reptiles, birds, and mammals) as well as for invertebrates. The analysis considers how each Program Renewal activity type may affect each of the special-status wildlife species identified as potentially occurring in the Program Renewal Area, as well as several common wildlife species for which Program Renewal impacts could be significant under CEQA.

Impact Types

Program Renewal activities may affect special-status animals through direct or indirect disturbance of individuals and populations as well as the disturbance, modification, or destruction of habitat. The types of potential impacts that are considered in this evaluation, grouped by maintenance activity type, are described as follows.

Bank Stabilization

Fish

The effects of bank stabilization on fish depend on the community supported in the reach where the activity occurs, the habitat present at the site, and the type of bank stabilization installed. Important habitat values for fish that may be affected by bank stabilization activities would include effects on riparian shrubs and trees, instream and overhanging escape cover, and sedimentation.

Effects of bank stabilization on fish would depend largely on the species' use of the affected reach, the existing (pre-stabilization) condition of the bank, and the stabilization methods that were employed. Replacement of a natural or "soft" bank, especially one supporting riparian vegetation, with "hard" substrate such as concrete or riprap that was not conducive to riparian revegetation growth would likely result in an adverse effect on habitat for fish, including steelhead. In contrast, replacement of a hardened bank with softer stabilization methods, especially those that enhance instream complexity, would result in a considerable net benefit to fish, by increasing habitat complexity and enhancing refugia, pool-riffle complexes, and available habitat. To minimize adverse environmental effects, Valley Water first considers "soft" approaches or biotechnical bank stabilization techniques where feasible and appropriate. Bank stabilization also could lead to degradation of habitat through the loss of undercut banks.

Riparian vegetation is important in determining the structure and function of instream habitat. For example, overhanging riparian vegetation provides shade that moderates stream temperatures. Additionally, terrestrial invertebrates that occur in riparian vegetation are an important food item for salmonids, entering stream channels as a result of being blown or washed off riparian vegetation (Rundio and Lindley 2008). Terrestrial invertebrates can constitute 50–85 percent of the prey biomass consumed by salmonids seasonally in forested streams (Baxter et al. 2005, Rundio and Lindley 2008). In addition, plant material that falls into streams is an important food source for aquatic insects, which in turn are fed on by fish (U.S. Department of Agriculture Forest Service 1979, Knight and Bottorff 1984, Rundio and Lindley 2008, Rossi et al. 2022).

The loss of overhanging riparian vegetation can result in greater sunlight penetration and subsequent warming of stream temperatures. Increased sunlight and temperatures can increase the production of algae and subsequently aquatic invertebrates (Rossi et al. 2022). Water temperature and food availability are critical factors for rearing juvenile salmonids. The reported preferred and tolerable water temperatures for juvenile steelhead can be highly variable, potentially associated with variable acclimation temperatures, local adaptation, and other site-specific conditions. For example, preferred water temperatures for fry and juvenile steelhead across geographic regions have been reported to range from about 45°F to 65°F (Adams et al. 1975, Myrick and Cech 2001, Rich 1987). When additional food is available, juvenile *O. mykiss* and steelhead can also increase feeding to meet increased metabolic demands imposed by above-optimal temperatures, and growth rates can be higher under warmer conditions (Wurtsbaugh and Davis 1977, Hayes et al. 2008). However, the upper incipient lethal temperature for juvenile rainbow trout is reported to be 75°F to 79°F (Sullivan et al. 2000, McCullough et al. 2001).

In addition to direct effects of temperature on steelhead metabolic rate, temperature can also influence steelhead indirectly by influencing ecological interactions (for example, competition and predation) and food availability. For example, in some watersheds, warm water temperatures support and provide a competitive advantage for aquatic invasive species such as largemouth bass (Rahel and Olden 2008). Aquatic invasive species have been documented to prey on juvenile steelhead and compete for habitat and food resources (Carey et al. 2011, Thompson et al. 2012).

Repeated removal of smaller trees would prevent them from growing into larger trees, and thus over the long term, Program Renewal activities could reduce the input of large woody debris into streams and reduce the development of extensive root systems that would provide additional instream complexity. Over the course of the Program Renewal (2027–2036), such impacts would be limited by the extent to which 10 years' growth could substantially change habitat conditions or the contribution that individual trees could make to fish habitat. However, vegetation management would reduce the number of trees that grew tall enough to provide such habitat complexity resources to streams. Such complexity would be important to fish by encouraging the development of riffle/pool complexes, which would be important to steelhead spawning and feeding, and would provide refugia from predators and high flow velocities. Thus, bank stabilization activities that resulted in the loss of riparian vegetation (e.g., grading to remove undercut banks and clearing of vegetation before the installation of bank armoring) may adversely affect fish as a result of increased water temperatures and reduced food availability. The grading and armoring of undercut banks and the removal of overhanging vegetation and associated roots protruding from eroding banks also may adversely affect fish habitat by reducing the availability of instream escape cover.

The presence of dams along most SMP-maintained streams likely has resulted in significant shifts in vegetation type and density over time along the stream reaches below the dams. Without flushing flows during winter storms, vegetation has encroached on the channel, reducing channel width and, in many areas, densely shading the channel. Studies have found that primary production in seasonally warm, unshaded streams are often higher than those in shaded, cool streams (Casagrande 2010). Greater primary production can lead to greater food availability for foraging fish, thus increasing growth rates (Rossi et al. 2022, Casagrande 2010). However, due to the lack of shading during the summer and fall months, stream temperatures in Program Renewal Area streams would likely increase to above optimal temperature for rearing salmonids and fish would be likely to migrate out of these areas in order to seek thermal refugia. Therefore, thinning of vegetation as a result of the Program Renewal's vegetation management component may result in temporary benefits to steelhead and other fish by increasing prey abundance, but would likely result in decreased terrestrial invertebrate inputs and result in areas with suboptimal stream temperatures during the summer and fall months.

The loss of riparian vegetation on channel banks following bank stabilization activities also may result in an increase in erosion and sedimentation. Stream bank erosion is a natural process that can be beneficial to fish by providing a source of the boulders, cobble, and gravel necessary for high-quality salmonid spawning, rearing, and overwintering habitat. However, when natural levels of erosion are exceeded, sedimentation may have adverse effects on salmonid habitat by filling in spaces between gravels and cobbles. This embedding of gravels can impede intragravel flow, which is important for delivering oxygen to incubating eggs; create an impenetrable barrier that prevents the emergence of fry from their gravel nest; and decrease the amount of available habitat for overwintering steelhead, which use interstitial spaces in cobble or boulder substrate during winter periods of inactivity to reduce their exposure to predation and as refuge from downstream displacement during high velocity flows (Stillwater Sciences 2006, Michel et al. 2013, Buxton et al. 2015, Jorgensen et al. 2021). In addition, increased erosion may disturb benthic

organisms, which could impact prey presence and abundance (Bellmore et al. 2019). Increases in turbidity and sediment input, especially fine sediments, also may cause stress to or mortality of fish because of displacement, interference with orientation, reduced foraging efficiency, physical abrasion, gill damage or clogging, inner organ changes, and metabolic changes (Michel et al. 2013, Bellmore et al. 2019). Minor spills of petrochemicals, hydraulic fluids, and solvents may occur during vehicle and equipment refueling or as a result of leaks, adversely affecting water quality and potentially killing or injuring fish. Similarly, contact by uncured concrete with water could release chemicals that could impair the health of fish.

In accordance with its BMPs, Valley Water would capture and relocate native fish before the initiation of bank stabilization activities that would require temporary water diversions or dewatering. Before and during dewatering, qualified biologists will capture fish and relocate them away from the work area to avoid direct mortality and minimize possible impacts during maintenance activities. During relocation operations, fish would be subject to harassment, pursuit, capture, injury, mortality, and related stresses associated with netting, electrofishing, temporary captivity, and release into the relocation site. In addition to direct injury and mortality, the effects of electrofishing may include occasional spinal injuries that reduce growth rates of injured fish (Dalby et al. 1996, Ainslie et al. 1998, Boughton et al. 2022). Electrofishing would follow standard NMFS and CDFW survey protocols, which would minimize injury and mortality during stunning, handling, and relocating fish. Fish that were not relocated and that remained within the work site may be subjected to degraded water quality, temporary blockage of migration, stranding in isolated pools, and mortality as a result of dewatering or diverting water for bank stabilization activities. Thus, while the benefits of relocation would far outweigh the complete loss of individuals that would occur if fish were not relocated before dewatering took place, relocation could still result in adverse effects.

Aquatic benthic macroinvertebrates within the dewatered work area may be killed or the population's abundance may be reduced after dewatering (Cushman 1985). However, effects to macroinvertebrates will be temporary and rapid recolonization in about one to two months is expected after rewatering (Cushman 1985, Thomas 1985, Harvey 1986). Effects on macroinvertebrate loss on fish are negligible because upstream sources would be available downstream of the dewatered areas because flows would be maintained during dewatering.

Soil and groundwater in the Guadalupe River watershed contain potentially hazardous levels of mercury contamination (see Section 3.8, "Hazards and Hazardous Materials"). Bank stabilization activities involving ground disturbance may expose the mercury and potentially release it into the environment. Mercury is a toxic constituent that bioaccumulates in the food chain of aquatic organisms and terrestrial wildlife. Effects of methylmercury exposure on fish can include oxidative damage, impacts to reproduction, altered feeding behavior, and impacts to gonadal development, depending on the level of exposure and the life stage of the fish that is exposed (Wu et al. 2018).

Bank stabilization activities, including those that require dewatering and those that do not, may result in increased turbidity within and downstream from the footprint

of the activities due to mobilization of fine sediments. Petrochemicals, hydraulic fluids, and solvents that are spilled or leaked from maintenance vehicles or equipment may affect the health of fish within or downstream from the activity area, and fresh concrete may release harmful chemicals into the water if dewatering occurs before the concrete has cured.

Amphibians and Reptiles

Potential direct effects of bank stabilization activities on amphibians and reptiles include the injury or mortality of individuals as a result of worker foot traffic, equipment use, vehicular traffic, vegetation management, and earth-moving activities. Seasonal movements of these species may be temporarily affected during bank stabilization activities because of disturbance, and substrate vibrations may cause individuals to move out of refugia, exposing them to a greater risk of predation or desiccation. Petrochemicals, hydraulic fluids, and solvents that are spilled or leaked from construction vehicles or equipment may kill individuals. Increases in human concentration and activity in the vicinity of suitable habitat may result in an increase in native and nonnative predators that would be attracted to trash left at the work site and that would prey opportunistically on these species. Movement of construction personnel and equipment within the site, and between on-site and off-site areas, could also spread pathogens such as chytrid fungus and ranavirus, which can impair the health of amphibians. Amphibians and reptiles can be trapped in pits, trenches, or other depressions excavated during work activities, or could be impacted if they take refuge in construction materials that are subsequently moved. Dewatering activities may result in a temporary loss of habitat, blockage of movement, and stranding or death of amphibian eggs and larvae.

Fossorial (burrowing) wildlife species and species that use existing animal burrows as refugia (e.g., Pacific tree frogs, western toads, western fence lizards, California newts, ensatina [*Ensatina eschscholtzii*], California tiger salamanders, California red-legged frogs, western skinks, gopher snakes, and others) may be crushed in their burrows by the passage of heavy equipment or trapped and suffocated. Furthermore, loss of subterranean habitat (i.e., burrows) as a result of grading and bank armoring may result in the displacement of small mammals, as well as invertebrates that would serve as a food source for some species of amphibians and reptiles. Additionally, where "hard" bank stabilization methods are used, bank protection could result in the loss of foraging, refugial, and overwintering habitat by removing burrows from the work area.

Special-status amphibians and reptiles that are found during pre-construction surveys and relocated to suitable habitat outside of the work site may be subjected to physiological stress and be at greater risk of predation.

As discussed under *Fish* above, bank stabilization activities in the Guadalupe River watershed may expose soils contaminated with mercury. Effects of methylmercury exposure on wildlife, including amphibians and reptiles, can include mortality (death), reduced fertility, slower growth and development, and abnormal behavior that affects survival, depending on the level of exposure (Scheuhammer et al. 2007).

Birds

Increased human activity may also affect the behavior of birds, causing them to avoid work areas, and therefore exposing them to increased competition with other birds in the areas to which they have dispersed, and increased levels of predation caused by unfamiliarity with the new area. Increases in human concentration and activity associated with Program Renewal activities in the vicinity of suitable habitat may also result in an increase in native and nonnative predators that would be attracted to trash left in work areas, as well as a reduction in the quality of breeding or foraging habitat caused by the introduction of nonnative vegetation or pathogens such as *Phytophthora*.

The nesting season for most birds breeding in the Program Renewal Area is typically from February 1 through August 31, though some species may begin nesting in January or may have nests that remain active into September. Because bank stabilization activities will occur outside of the rainy season, the work would largely overlap the avian breeding season. If birds are actively nesting in or close to work areas when maintenance activities occur, vegetation clearing, grading, and activity of equipment, vehicles, and personnel could result in the physical disturbance or destruction of active nests (including eggs and young) or disturb adults to the point of nest abandonment.

The Program Renewal Area provides potential nesting habitat for many common and special-status bird species. Clearing and grading may result in the temporary or permanent loss of nesting and/or foraging habitat. Much of that habitat would regenerate following the completion of construction and vegetative stabilization of bare soils by Valley Water and would then be available for use by nesting birds, but some long-term loss of habitat would occur. In addition, increased sedimentation or hazardous material spills from maintenance activities may result in the temporary or permanent degradation of water quality and, hence, habitat quality in marsh or aquatic habitats downstream from work sites, which could impact habitat used by aquatic and riparian bird species.

As discussed above, bank stabilization activities in the Guadalupe River watershed may expose soils contaminated with mercury. Birds fed inorganic mercury show a reduction in food intake and consequent poor growth, with other reported effects including increased enzyme production, decreased cardiovascular function, blood parameter changes, immune response, changes in kidney function and structure, and behavioral changes) (Boening 2000, Scheuhammer et al. 2007).

Mammals

During bank stabilization activities, smaller mammals may be crushed or injured by personnel or equipment. Further, species that seek safety in burrows (mice, skunks, squirrels, and others) could be killed or entombed in collapsed burrows. Larger, more mobile mammal species, such as deer, canids, and bobcats, and some smaller mammals would vacate the area, potentially exposing them to increased competition from conspecifics already occupying the area to which they are displaced as well as increased levels of predation due to unfamiliarity with the new area or lack of sufficient refugia.

Removal of trees containing cavities and crevices, as well as modification of rock outcrops with crevices, would reduce availability of roosting sites for bats, including potential maternity roost sites. When trees or rocks containing roosting colonies or individual bats are removed or modified, individual bats can also be physically injured, killed, or subjected to physiological stress resulting from being disturbed during torpor. Adult and volant juvenile bats roosting in trees, structures, or rocky areas that are removed or otherwise disturbed may flush from these areas before they can be injured or killed. However, bats flushed during the daytime can suffer increased predation, resulting in the loss of small numbers of individuals.

During construction, bank stabilization activities would also result in the short-term loss of foraging habitat, such as open grassland areas in which small mammals forage, as well as a temporary impact on foraging individuals through the alteration of foraging patterns (e.g., avoidance of work areas because of increased noise and activity levels during maintenance activities).

As discussed above, bank stabilization activities in the Guadalupe River watershed may expose soils contaminated with mercury. Effects of methylmercury exposure on wildlife can include mortality (death), reduced fertility, slower growth and development, and abnormal behavior that affect survival, depending on the level of exposure (Scheuhammer et al. 2007).

Invertebrates

Invertebrates occur along and adjacent to channels where bank stabilization activities will occur. In these areas, work activities can impact invertebrates by removing larval host plants; killing eggs, larvae, or pupae; causing mortality or injury due to crushing by personnel or equipment; and removing a variety of flowering plants that serve as adult nectar sources. For species such as moths and butterflies, clearing of vegetation could remove larval host plants and nectar sources, and dust mobilization by Program Renewal activities could adversely affect the health of such plants in areas adjacent to work areas. For species such as bees, work activities could destroy subterranean nests and their occupants; clear vegetation that serves as pollen and nectar sources; and affect pollen and nectar sources through dust mobilization or changes in drainage patterns. In addition, invertebrate species may be adversely affected by habitat conversion, which could result from the unintentional introduction of nonnative grasses and forbs to work sites.

Sediment Removal

Fish

Sediment removal activities (e.g., sediment removal, access road construction, and staging area construction) may result in the removal of instream emergent vegetation and riparian vegetation along the channel banks, resulting in impacts similar to those described for loss of riparian vegetation as a result of bank stabilization activities. The removal of instream vegetation and riparian habitat may adversely affect fish as a result of increased water temperatures and reduced food availability. Additionally, the loss of instream cover, such as rocks, vegetation, and large woody debris, may adversely affect fish as a result of increased predation

caused by a decrease in the availability of escape cover and the alteration of local hydraulics (e.g., increasing water velocity), which could reduce the frequency of riffle and pool habitat (Stillwater Sciences 2006), and the loss of refugia during high flows. Sediment removal also would result in the loss of substrate used by various fish for foraging or spawning, most notably the removal of spawning gravel for salmonids and Pacific lamprey.

As discussed under bank stabilization above, increased sedimentation may have adverse effects on salmonid and Pacific lamprey spawning and overwintering habitat by filling in interstitial spaces between gravels and cobbles. Increases in turbidity and sediment input may also cause stress to fish because of feeding difficulties or displacement. Furthermore, settling of silt disturbed by sediment removal activities and contouring and grading of the channel following sediment removal may degrade spawning or rearing habitat in or downstream of work sites.

As discussed for bank stabilization activities, Valley Water would capture and relocate native fish in accordance with its BMPs before the initiation of sediment removal activities that require temporary water diversions or dewatering throughout the Project Area. During relocation operations, native fish would be subject to harassment, pursuit, capture, mortality, and related stresses associated with netting and electrofishing. Furthermore, fish that were not relocated and that remained within the work site may be subjected to degraded water quality, temporary blockage of migration, stranding in isolated pools, and mortality as a result of sediment removal activities.

Other effects of sediment removal on fish would be similar to those described above for bank stabilization. These would include the potential for fish injury or mortality during relocation efforts and adverse effects of fuel or chemical spills and mercury mobilization.

However, the removal of sediment also may result in beneficial impacts on the ability of fish to move along streams, particularly for salmonids to migrate between estuarine areas and upstream spawning and rearing habitats by improving upstream and downstream passage conditions. Sediment removal from infrastructure that provides access to fish passage and fish ladders will create more desirable migration conditions, which will benefit fish migration and movement throughout the watershed.

Amphibians and Reptiles

Similar to the potential direct effects of bank stabilization activities described above, potential effects of sediment removal activities on amphibians and reptiles can include the injury or mortality of individuals as a result of worker foot traffic, equipment use, vehicular traffic, vegetation management, and earth moving activities. Seasonal movements of these species may be temporarily affected during bank stabilization activities because of disturbance, and substrate vibrations may cause individuals to move out of refugia, exposing them to a greater risk of predation or desiccation. Petrochemicals, hydraulic fluids, and solvents that are spilled or leaked from construction vehicles or equipment may kill individuals. Increases in human concentration and activity in the vicinity of suitable habitat may result in an

increase in native and nonnative predators that would be attracted to trash left at the work site and that would prey opportunistically on these species.

In addition, for amphibians, sediment removal activities could disturb boulders or cobbles that support egg masses; destroy egg masses directly; result in siltation of eggs or tadpoles; and expose adults, juveniles, larvae, and/or eggs to petrochemicals, hydraulic fluids, solvents, and/or methylmercury. Movement of construction personnel and equipment within the site, and between on-site and off-site areas, can also spread pathogens such as chytrid fungus and ranavirus, which can impair the health of amphibians. Dewatering activities may result in a temporary loss of habitat, blockage of movement, and stranding or death of amphibian eggs and larvae.

Special-status amphibians and reptiles that are found during pre-construction surveys and relocated to suitable habitat outside of the work site may be subjected to physiological stress and be at greater risk of predation, and dewatering activities may result in a temporary loss of habitat, blockage of movement, and stranding or death of frog eggs and tadpoles.

Birds

Similar to the potential effects of bank stabilization activities described above, potential impacts of sediment removal activities on birds include disturbance of birds within and adjacent to the work areas during maintenance activities, increases in native and nonnative predators due to trash left in work areas, and a reduction in quality of breeding or foraging habitat caused by the introduction of nonnative vegetation, pathogens such as *Phytophthora*, and/or an increased exposure to mercury. In addition, if birds are actively nesting in or close to work areas when sediment removal activities occur, vegetation clearing, grading, and activity of equipment, vehicles, and personnel could result in the physical disturbance or destruction of active nests (including eggs and young) or disturb adults to the point of nest abandonment.

The removal of instream vegetation associated with sediment removal activities would result in the temporary loss of habitats that serve as breeding and/or foraging habitat, both in sediment removal areas and in associated access and staging areas. In addition, increased sedimentation or hazardous material spills from maintenance activities may result in the temporary or permanent degradation of water quality and, hence, degradation in the quality of marsh or aquatic habitats downstream that may be used by aquatic and riparian-associated bird species.

Mammals

Similar to the potential direct effects of bank stabilization activities described above, potential impacts of sediment removal activities on mammals can include mortality or injury by personnel or equipment; exposure to increased competition from conspecifics as a result of displacement; exposure to increased levels of predation because of unfamiliarity with the new area, lack of sufficient refugia, or increased numbers of predators; exposure to increased levels of mercury; and/or the short-term loss of foraging habitat. These effects would occur primarily in non-instream

staging and access areas and would be limited to in-channel sediment removal areas, as most mammals in the Program Renewal Area are terrestrial.

Invertebrates

Impacts to invertebrates from sediment removal would be similar to those described above for bank stabilization activities, although impacts to common aquatic invertebrates would be greater because sediment removal activities will be focused within aquatic habitats along stream channels, while impacts on upland invertebrates and their habitat would be limited within associated access and staging areas.

Vegetation Management

Fish

Because fish spend their time in habitats within streams, and many of the projected maintenance activities would occur in upland areas on levee tops and upper banks (i.e., not in the water itself), the potential for direct effects on fish during many Program Renewal activities, including vegetation management on levees, is substantially lower than the potential for direct effects on this species during similar work in aquatic habitats.

As discussed under the "Bank Stabilization" and "Sediment Removal" sections above, removal of instream and riparian vegetation may adversely affect steelhead as a result of increased water temperatures, reduced food availability, reduced escape cover, and the alteration of local hydraulics. In addition, decaying vegetation left in the channel following vegetation management activities may cause deterioration of water quality due to the depletion of oxygen during decomposition.

Settling of silt disturbed by vegetation management activities may result in adverse effects as discussed under "Bank Stabilization" and "Sediment Removal" above, including potential impacts on salmonid and Pacific lamprey spawning and rearing habitat as well as reduced prey or displacement.

Vegetation management activities may include the application of aquatic herbicides and surfactants, which may result in toxicity to fish and aquatic invertebrates if exposed to the products. The USEPA has conducted ecological risk assessments to determine the potential risks of labeled uses of herbicides and surfactants as described further in USEPA's (2004) *Overview of the Ecological Risk Assessment Process in the Office of Pesticide Program Renewals*. The risks of the potential, proposed products for use in aquatic environments (glyphosate, imazapyr, imazomox, triclopyr-choline, ethyl oleate, and paraffinic oil) on fish are summarized below. The assessments are useful in evaluating potential effects of herbicide and surfactant use on fish species in general for the Program Renewal Area. Evaluated herbicides and surfactants proposed for use by Valley Water are as follows, with a summary of the effects determination based on toxicity literature.

- Glyphosate (Rodeo): This is a systemic herbicide that could reach surface water via run-off after use (i.e., not direct exposure to watercourse) and is highly

immobile in soils (Blake and Pallett 2018). For freshwater and estuarine fish, the herbicide is slightly toxic to practically non-toxic on an acute exposure basis (Blake and Pallett 2018). Given the low soil mobility, there is a low chance residue would be present in aquatic environments after use in the Program Renewal Area. Use of the aquatically approved formulation at labeled rates would result in minimal effects to fish.

- Imazapyr (Habitat): This is a systemic herbicide that could reach surface water via run-off after use (i.e., not direct exposure to watercourse) and is relatively mobile in soils (USEPA 2014). For freshwater and estuarine fish, the herbicide is practically non-toxic on an acute exposure basis (USEPA 2014). Given the high soil mobility, residue could be present in aquatic environments after use in the Program Renewal Area.
- Imazamox (Clearcast, IMOX): This is an herbicide that could reach surface water via run-off after use (i.e., not direct exposure to watercourse) and is mobile in many soils (USEPA 2008). For freshwater and estuarine fish, the herbicide is practically non-toxic on an acute exposure basis (USEPA 2008). Given the high soil mobility, residue could be present in aquatic environments after use in the Program Renewal Area.
- Triclopyr-choline (Vastlan): This is an herbicide that could reach surface water via run-off after use (i.e., not direct exposure to watercourse) and is highly mobile in soils (Dow AgroSciences 2016). For freshwater and estuarine fish, the herbicide is practically non-toxic on an acute exposure basis (Dow AgroSciences 2016). Given the high soil mobility, residue could be present in aquatic environments after use in the Program Renewal Area.
- Ethyl oleate (Competitor): This is a non-ionic surfactant that could reach surface water via run-off after use (i.e., not direct exposure to watercourse). It is toxic to aquatic life, including fish, with 'long lasting effects' if exposed to the product (Virgon 2020). Residue could be present in aquatic environments after use in the Program Renewal Area.
- Paraffinic oil (Agri-Dex): This is a non-ionic surfactant that could reach surface water via run-off after use (i.e., not direct exposure to watercourse). There is no ecotoxicity information for this product (Helena 2019). Residue could be present in aquatic environments after use in the Program Renewal Area.

The majority of the herbicides summarized above are Category III and IV herbicides, which are the least toxic and most used by Valley Water staff, with the exception of triclopyr-chlorine and paraffinic oil, which are Category II herbicides and may also be used where needed. As explained in Chapter 2, *Project Description*, Program Renewal activities will minimize impacts to fish and aquatic habitat from herbicide use by implementing measures such as only using herbicides when other methods of vegetation management are impracticable; spot spraying emergent vegetation; not applying the herbicides directly to the wetted channel; application of herbicides by QAC or QAL licensed applicators; and complying with local, state, and federal regulations such as the SWRCB General Permit # CAG990005 (which requires a state-approved Aquatic Pesticide Application Plan to be followed), the orders for threatened and endangered species as stipulated by the 2004 United States District Court for certain pesticides applied near salmon-supporting waters, the 2006 United States District Court order for pesticide application around certain California red-

legged frog habitats, and the 2010 United States District Court order regarding pesticides and eleven species found in the Greater San Francisco Bay Area. In addition, BMPs would be implemented to reduce the potential effects of herbicides, as further described in the Impacts sections below.

Herbicides are commonly mixed with surfactants to increase effectiveness. Valley Water would continue to use surfactants to enhance the performance of herbicides. Surfactants aid the ability of an herbicide to penetrate the surface of vegetation by increasing its ability to spread over vegetation, stick to foliage, and penetrate thick cuticles. For aquatic herbicides, the use of a surfactant is typically necessary to achieve reasonable levels of control. In instances where surfactants are absent from the mixture, the level of control is often reduced. A reduction in control results in the need for a greater return frequency, which translates to more herbicide being used in the system and more frequent disturbance to the site. Concentrations of surfactants to herbicides are generally very low but may increase the toxicity of the final mixture.

In general, aquatic species such as fish are more susceptible to adverse effects of toxicity from surfactants than terrestrial wildlife because of the potential for alteration of cell permeability, thus increasing the potential for absorption of chemicals through their thin, moist skin. Some surfactants, particularly those that are nonylphenol-based, have been documented to result in chemical-induced lethargy and unconsciousness in fish, which can result in an increased risk of predation, as well as estrogenic effects (Smith et al. 2004, U.S. Department of Agriculture Forest Service 2007). However, as described in the Chapter 2,"Project Description," Valley Water proposes to limit surfactant use to non-ionic products that are documented to have the least toxic effect to aquatic life (compared to anionic surfactants, Mustapha and Bawa-Allah 2020). Both of the potential surfactants are oil-based (Competitor is vegetable oil based while the primary ingredient in Agri-dex is a paraffin-based oil) and function by increasing the absorption of herbicides through plant tissues. They are especially useful in increasing the penetration of herbicides through the bark of woody brush or tree stems (Bakke 2007). A study on the toxicity of surfactants to juvenile rainbow trout concluded that Agri-dex was less toxic to rainbow trout than two other commonly used surfactants, R-11 and LI 700 (Smith et al. 2004), and the 2006 Supplemental Environmental Assessment of the National Oceanic and Atmospheric Administration (NOAA) *Fisheries Implementation Plan for the Community Based Restoration Program Renewal* (NOAA 2006) concluded that Agri-dex was among the surfactants least toxic to marine and aquatic organisms (it is unknown whether Competitor was assessed).

Use of these herbicides and surfactants according to current label directions; following local, state, and federal regulations; and within the context of the Program Renewal (i.e., per the "Project Description" and incorporating applicable BMPs) is not expected to result in direct adverse effects on fish. Nevertheless, herbicides and surfactants may affect fish indirectly as a result of reduction in the availability of food items (e.g., invertebrates) and in the suitability of habitat (e.g., reduction in abundance of aquatic and terrestrial plants).

During the course of the Program Renewal, new surfactants or improved chemistries may be proposed to improve the efficacy of the Program Renewal or improve

protection to biological resources. The proposal of any new materials would include toxicological data for review by stakeholders. This would provide a process for review and approval before inclusion in the Program Renewal.

Repeated removal of smaller trees will prevent them from growing into larger trees, and thus over the long term, SMP activities could reduce the input of large woody debris into streams and reduce the development of extensive root systems that provide additional instream complexity.

Vegetation management activities performed by Valley Water can also have beneficial effects on habitats for fish. These activities may include invasive plant management and vegetation management for ecological health. Some vegetation management activities may also be extremely limited in extent such that no substantive impacts due to habitat removal or type conversation occurs (i.e., activities may have a neutral impact). In contrast, adverse effects of vegetation removal on fish communities are more likely to occur along perennial streams, where aquatic vegetation provides in-stream cover and complexity for fish and riparian vegetation provides benefits such as shading and protection from erosion, compared to intermittent streams that are dry for much of the year.

Downed tree management, including the retention, removal, cutting, and/or repositioning of trees within the channel, will also be performed under the Program Renewal. Downed trees provide benefits to aquatic species, such as fish, by providing refugia, foraging habitat, and in-stream habitat complexity. In anadromous salmonid channels, Valley Water aims to retain downed trees or large woody debris (defined as downed trees greater than 12 inches in diameter) where possible to preserve the beneficial physical and biological processes associated with the natural recruitment of wood to waterways. Complete removal of large woody debris typically occurs in highly modified streams. Where large woody debris is left in-place or repositioned, it can have ecological benefits for aquatic species. Where large woody debris is cut or removed these ecological benefits would also be removed; however, such debris is only removed where it would have an adverse effect on the channel such as limiting channel capacity, altering flows, increasing the risk of erosion or flooding, or affecting the function of a fish ladder. Benefits of downed tree management activities include removing large woody debris to facilitate fish passage or maintain the function of existing fish ladders as well as reducing negative impacts to instream habitats from erosion.

Amphibians and Reptiles

Similar to the potential effects of bank stabilization activities described above, potential direct effects of vegetation management activities on amphibians and reptiles include the injury or mortality of individuals as a result of worker foot traffic, equipment use, vehicular traffic, and vegetation management. Seasonal movements of these species may be temporarily affected during vegetation management activities because of disturbance, and substrate vibrations may cause individuals to move out of refugia, exposing them to a greater risk of predation or desiccation. Petrochemicals, hydraulic fluids, and solvents that are spilled or leaked from construction vehicles or equipment may kill individuals. Increases in human concentration and activity in the vicinity of suitable habitat may result in an increase

in native and nonnative predators that would be attracted to trash left at the work site and that would prey opportunistically on these species.

In addition, as described under sediment removal above for amphibians, vegetation management activities occurring in channels could disturb boulders or cobbles that support egg masses; destroy egg masses; result in siltation of eggs or tadpoles; expose adults, juveniles, larvae, and/or eggs to petrochemicals, hydraulic fluids, solvents, and/or methylmercury. Movement of construction personnel and equipment within the work area, and between on-site and off-site areas, can also spread pathogens such as chytrid fungus and ranavirus, which can impair the health of amphibians.

Special-status amphibians and reptiles that are found during pre-construction surveys and relocated to suitable habitat outside of the work site may be subjected to physiological stress and be at greater risk of predation, and dewatering activities may result in a temporary loss of habitat, blockage of movement, and stranding or death of eggs and larvae.

Vegetation management activities include the application of herbicides. Amphibians in particular could be impacted by herbicides due to the absorption of these chemicals through their thin, moist skin. The USEPA has conducted ecological risk assessments to determine the potential risks of labeled uses of several herbicides, including four proposed for use by Valley Water (glyphosate, imazapyr, and triclopyr), on the federally listed California red-legged frog. These assessments are useful in evaluating potential effects of herbicide use on other amphibian species in the Program Renewal Area. Evaluated herbicides proposed for use by Valley Water are as follows, with a summary of USEPA's effects determinations:

- Glyphosate (aquatic and upland applications): No direct effects would occur on aquatic-phase California red-legged frogs for any of the terrestrial or aquatic uses. Glyphosate can result in indirect adverse effects on both aquatic-phase and terrestrial-phase California red-legged frogs through reduction in available prey (aquatic and terrestrial invertebrates), as well as a reduction in habitat (aquatic and terrestrial plants) except where it is targeted to remove nonnative or invasive vegetation as a benefit to the species.
- Imazapyr (aquatic application only): No direct effects are anticipated. However, imazapyr is likely to affect adversely the California red-legged frog via indirect effects on habitat and/or primary productivity (i.e., ecosystem structure and function for both the aquatic plant community and riparian vegetation).
- Triclopyr (aquatic and upland applications): Triclopyr is likely to adversely affect the California red-legged frog via direct and indirect effects on both terrestrial and aquatic phases of this species.

As a result, the use of herbicides for vegetation management could result in direct and indirect adverse effects on amphibians, including the California red-legged frog and other species, as well as their habitats. As discussed in detail in Chapter 4 of the SMP Manual and under "Regulatory Setting" above, Valley Water will continue to use herbicides in compliance with the current applicable state and federal laws and in accordance with Program Renewal permits.

In addition, per Chapter 4 of the SMP Manual, the following requirements apply to herbicide use throughout the Program Renewal Area and will help protect special-status wildlife species from adverse effects of herbicide application:

- All herbicide use must be preceded by the appropriate biological surveys and clearances.
- Herbicide application can only occur within the Program Renewal-mapped distribution of the California red-legged frog and California tiger salamander when the creek or area is dry and no rain is forecast for the next 48 hours.

As noted for fish above, Valley Water proposes to use surfactants designed for aquatic applications as part of its herbicide Program Renewal. Surfactants aid the ability of an herbicide to penetrate the surface of vegetation by increasing its ability to spread over vegetation, stick to foliage, and penetrate thick cuticles. Most aquatic herbicides either require or highly recommend the use of a surfactant to achieve reasonable levels of control. In instances where surfactants are absent from the tank mix, the level of control often is reduced. A reduction in control would cause a greater return frequency, which would translate to more herbicide being used in the system and more frequent disturbance to the site.

In general, aquatic species (e.g., fish and amphibians) are more susceptible to adverse effects of herbicides compared to terrestrial species because of the potential for surfactants to alter cell permeability, thus increasing the potential for absorption of chemicals through their thin, moist skin. Some surfactants, particularly those that are nonylphenol-based, have been documented to result in chemical-induced lethargy and unconsciousness in fish, which can result in an increased risk of predation as well as have estrogenic effects (Smith et al. 2004, U.S. Department of Agriculture Forest Service 2007). However, Valley Water proposes to limit surfactant use to two products documented to have the least toxic effects on aquatic life: a vegetable-based oil (ethyl oleate) and a paraffin-based oil. Both surfactants function by increasing the absorption of herbicides through plant tissues, and they are especially useful in increasing the penetration of herbicides through the bark of woody brush or tree stems (Bakke 2007). A study on the toxicity of surfactants to juvenile rainbow trout concluded that the paraffin-based oil was less toxic to rainbow trout than two other commonly used surfactants, R-11 and LI 700 (Smith et al. 2004), and the 2006 Supplemental Environmental Assessment of National Oceanic and Atmospheric Administration Fisheries Implementation Plan for the Community Based Restoration Program Renewal (National Oceanic and Atmospheric Administration 2006) concluded that the paraffin-based oil was among the surfactants least toxic to marine and aquatic organisms (it is unknown whether ethyl oleate was assessed).

In addition, Valley Water would follow the herbicide use guidelines established in its quality and environmental management system documents, including Q751D02 (Control of Oversight of Pesticide Use) and WW75100 (Vegetation Control Work Instructions), and in Chapter 2, “Project Description”. These guidelines require that all herbicide use incorporate appropriate biological surveys and clearances prior to the start of work, and that all herbicide application has a pest control recommendation provided by a California-licensed pest control advisor. A

recommendation is provided after each site is surveyed and the most appropriate control methods for the site are determined.

Vegetation management activities performed by Valley Water, such as invasive plant management and vegetation management for ecological health, can also have beneficial effects on habitats for amphibians and reptiles. Some vegetation management activities may also be extremely limited in extent such that no substantive impacts due to habitat removal or type conversation occurs (i.e., activities may have a neutral impact). In contrast, adverse effects on the northwestern pond turtle, federally proposed as threatened, are expected to be greatest along perennial streams, where aquatic vegetation provides in-stream cover and riparian vegetation provides refugia, and less along intermittent streams that are dry for much of the year (though these turtles do occur along some intermittent streams).

Birds

Similar to the potential effects of bank stabilization and sediment removal activities described above, potential impacts of vegetation management activities on birds include disturbing individuals such that they move away from work areas, potentially exposing them to increased competition and levels of predation; an increase in native and nonnative predators that are attracted to trash in work areas; and a reduction in the quality of breeding or foraging habitat caused by the introduction of nonnative vegetation or pathogens such as *Phytophthora*. In addition, if birds are actively nesting in or close to work areas when maintenance activities occur, vegetation management could result in the physical disturbance or destruction of active nests (including eggs and young) or disturb adults to the point of nest abandonment.

During maintenance activities, some bird species will take advantage of increased availability of prey that are flushed out of the work area and into the open. Following the completion of maintenance activities, vegetation in the work area will be limited, and the loss of vegetation will reduce the amount of prey and cover available for birds. However, birds will gradually return to reoccupy the area as the vegetation re-establishes.

Most importantly, vegetation maintenance activities will result in a loss of nesting, foraging, and roosting habitat, particularly in the form of riparian and wetland vegetation. Riparian habitats in Santa Clara County support very high densities and diversity of birds (Rottenborn 1997). Vegetation management effects would be largely temporary in any specific area, although the repeated nature of these impacts would limit the regeneration of woody riparian vegetation. Bird diversity generally increases with increasing foliage height diversity, or stratification of the vegetation. As a result, inhibiting the development or maintenance of a multi-layered riparian forest through vegetation management is expected to reduce bird diversity. Furthermore, because the densities of native riparian birds tend to increase with increasing vegetation volume (Mills et al. 1991), vegetation management activities that reduce the volume of vegetation (i.e., how dense the vegetation is) can reduce bird abundance. As a result, vegetation management will adversely affect some aspects of the riparian bird community.

The loss of understory vegetation resulting from pruning, coppicing, and mowing would reduce habitat for understory birds and could reduce dispersal ability of bird species associated with dense vegetation, as such species may be reluctant to move through areas lacking suitably dense cover. Additional loss of vegetation (typically consisting of ruderal vegetation) along access roads, on terraces, in outboard areas, and on channel slopes adjacent to streams would reduce foraging opportunities and prey availability for riparian birds, as well as nesting habitat for certain riparian-associated species that will nest in these areas.

In locations where vegetation management is performed repeatedly with regular frequency, riparian habitats are maintained in an early successional stage with relatively low vegetation density and limited vertical structure, and correspondingly low bird abundance. However, for bird species that occur primarily in early successional habitats, vegetation management can help maintain such habitat over the long term. In contrast, for bird species associated with more mature forests, repeated management of younger vegetation that prevents it from becoming mature may result in the long-term decline in these species. Tree removal may also result in the loss of snags or live trees that otherwise would provide habitat for a variety of birds.

In locations where vegetation management is performed less frequently, or that are targeted for new, regular management, adverse effects on riparian bird communities would be relatively higher due to the greater density and structural diversity of vegetation that would be impacted by the activity, and the greater diversity and abundance of birds that use such vegetation.

Vegetation management activities performed by Valley Water, such as invasive plant management and vegetation management for ecological health, can also have beneficial effects on habitats for birds. Some vegetation management activities may also be extremely limited in extent such that no substantive impacts due to habitat removal or type conversation occurs (i.e., activities may have a neutral impact).

Mammals

Similar to the potential effects of bank stabilization activities described above, smaller mammals may be crushed or injured by personnel or equipment during vegetation management activities, and species that seek safety in burrows could be killed or entombed in collapsed burrows. Larger, more mobile mammal species would vacate the area, potentially exposing them to increased competition from conspecifics already occupying the area to which they were displaced and increased levels of predation due to unfamiliarity with the new area or lack of sufficient refugia. These effects would occur primarily in non-instream areas, as most mammals in the Program Renewal Area are terrestrial.

The removal of trees containing cavities and crevices would reduce availability of roosting sites for bats, including potential maternity roost sites. In addition, when trees containing roosting colonies or individual bats are removed or modified, individual bats can be physically injured, killed, or subjected to physiological stress resulting from being disturbed during torpor. Bats roosting in trees that are removed or otherwise disturbed may flush from these areas before they can be

injured or killed. Bats flushed during the daytime could suffer increased predation, resulting in the loss of small numbers of individuals.

As described above for birds, the removal of vegetation from the Program Renewal Area would remove habitat and cover for mammals, and the loss of understory vegetation resulting from pruning, coppicing, or mowing could reduce dispersal ability of species associated with dense vegetation. As such, mammals may be reluctant to move through areas without suitably dense cover. The repeated management of younger vegetation, which would prevent it from becoming mature, may result in the long-term decline in mature riparian forests, reducing use of these areas by mammal species that rely on larger, denser habitat areas and/or mature trees, such as larger mammals and roosting bats.

Following completion of maintenance activities, vegetation in much of the impacted area would regrow over time. However, in locations where vegetation management is performed repeatedly with regular frequency, riparian habitats are maintained in an early successional stage with relatively low vegetation density and limited vertical structure, and correspondingly low bird abundance. In locations where vegetation management is performed less frequently, or that are targeted for new, regular management, adverse effects on mammals that utilize riparian habitats would be relatively higher due to the greater density and structural diversity of vegetation that would be impacted by the activity, and the potential for these areas to support a greater diversity and abundance of mammal species.

Vegetation management activities performed by Valley Water, such as invasive plant management and vegetation management for ecological health, can also have beneficial effects on habitats for mammals. Some vegetation management activities may also be extremely limited in extent such that no substantive impacts due to habitat removal or type conversation occurs (i.e., activities may have a neutral impact.

Invertebrates

Similar to the potential effects of bank stabilization activities described above, potential impacts of vegetation management activities on invertebrates would include removing larval host plants; killing eggs, larvae, or pupae; causing mortality or injury due to crushing by personnel or equipment; and removing a variety of flowering plants that serve as adult nectar sources. For species such as moths and butterflies, clearing of vegetation could remove larval host plants and nectar sources, and dust mobilization by Program Renewal activities could adversely affect the health of such plants in areas adjacent to work areas. For species such as bees, work activities could destroy subterranean nests and their occupants, clear vegetation that serves as pollen and nectar sources, and affect pollen and nectar sources through dust mobilization or changes in drainage patterns. In addition, invertebrate species may be adversely affected by habitat conversion, which could result from the unintentional introduction of nonnative grasses and forbs to work sites.

Vegetation management activities performed by Valley Water, such as invasive plant management and vegetation management for ecological health, can also have

beneficial effects on habitats for invertebrates. Some vegetation management activities may also be extremely limited in extent such that no substantive impacts due to habitat removal or type conversation occurs (i.e., activities may have a neutral impact).

Management of Animal Conflicts

Fish

Surface application of erosion control blankets, pyramat, and chain link for the purpose of animal conflicts management may result in a loss of vegetation that was overhanging and shading the active channel. As discussed above, riparian vegetation plays an important role in determining the structure and function of fish habitat, and the loss of such vegetation could result in increased stream temperatures and a loss of escape cover for fish.

Discharge of sediments into the channel as a result of ground-disturbing activities on levee surfaces (e.g., filling or compacting of crevices/holes), or spills/leaks of fuels and other chemicals, may result in adverse effects as discussed under "Bank Stabilization" and "Sediment Removal" above, including potential impacts on salmonid spawning and rearing habitat as well as reducing prey or displacement. The use of certain fumigants, such as gas cartridges and aluminum phosphide, would be unlikely to result in adverse water quality effects, as it would be applied directly to rodent burrows and would be prevented from diffusing out of treated burrows.

Amphibians and Reptiles

Similar to the potential direct effects of bank stabilization activities described above, potential impacts on amphibians and reptiles resulting from the management of animal conflicts include the injury or mortality of individuals as a result of worker foot traffic, equipment use, vehicular traffic, vegetation management, and earth-moving activities. Seasonal movements of these species may be temporarily affected because of disturbance, and substrate vibrations may cause individuals to move out of refugia, exposing them to a greater risk of predation or desiccation. Petrochemicals, hydraulic fluids, and solvents that are spilled or leaked from construction vehicles or equipment may kill individuals. Increases in human concentration and activity in the vicinity of suitable habitat may result in an increase in native and nonnative predators that would be attracted to trash left at the work site and that would prey opportunistically on these species. Movement of personnel and equipment on the site, and between on-site and off-site areas, could also spread pathogens such as chytrid fungus and ranavirus, which can impair the health of amphibians. Amphibians and reptiles can also be impacted if they take refuge in construction materials that are subsequently moved.

Direct mortality of amphibians and reptiles that use existing animal burrows as refugia, as well as loss of subterranean habitat for those species, would occur due to filling and/or compacting of burrows, crevices, and other holes. In addition, control of small mammal populations would result in a reduction in the availability of refugia for amphibians and reptiles, and the displacement of invertebrates that provide food for these species. An indirect reduction in available subterranean

habitat for amphibians and reptiles would also result from surface application control methods aimed at preventing rodent activity.

Special-status amphibians and reptiles that are found during pre-construction surveys and relocated to suitable habitat outside of the work site may be subjected to physiological stress and be at greater risk of predation.

Birds

As discussed for other maintenance activities above, increased human activity may affect the behavior of birds, causing them to avoid work areas, and therefore exposing them to increased competition with other birds in the areas to which they have dispersed, as well as increased levels of predation caused by unfamiliarity with the new area. Increases in human concentration and activity associated with Program Renewal activities in the vicinity of suitable habitat may also result in an increase in native and nonnative predators that would be attracted to trash left in work areas, as well as a reduction in the quality of breeding or foraging habitat caused by the introduction of nonnative vegetation or pathogens such as *Phytophthora*. In addition, if birds are actively nesting in or close to work areas when maintenance activities occur, vegetation clearing, grading, and activity of equipment, vehicles, and personnel could result in the physical disturbance or destruction of active nests (including eggs and young) or disturb adults to the point of nest abandonment.

In addition, surface compaction and/or the placement of physical barriers for the purpose of animal conflict management may affect the character of the vegetation within the target area and, thus, the composition of bird species that would use the treated location.

Small mammal control may reduce the availability of prey for birds that rely on small mammal populations as a food source, such as hawks, falcons, and owls.

The deterrence of birds that nest on structures such as bridges, culverts, or other Valley Water infrastructure via the installation of netting and/or removal of partially completed, inactive nests would reduce the availability of nesting habitat for these birds within work areas. In addition, the removal of partially completed nests could reduce nest productivity for the birds attempting to nest on a given site. However, once they are prevented from nesting at a particular location, birds are expected to seek out alternate locations for nesting. Because bridges, culverts, and other structures are widely available within and adjacent to Valley Water's work areas, birds that are deterred from nesting at these locations are expected to find similar readily available locations nearby that will support nesting by these species.

Mammals

Because burrowing mammals are the primary target of animal conflicts management, obvious direct impacts on target mammals would result from the poisoning and trapping of small mammals, particularly California ground squirrels and valley pocket gophers, and the removal of their burrows. Individuals could be crushed or entombed within their burrows, and some species that are displaced

(particularly ground squirrels, cottontails, and deer mice) would have to expend energy to find or dig new underground refuge sites. Carnivorous and omnivorous mammal species would lose some food resources with the loss of burrowing prey species.

Surface application of erosion control blankets, pyramat, and chain-link fencing for the purpose of animal conflicts management may result in direct and indirect impacts on mammal species. Blanket-like materials could trap small mammals underground and cause mortality or could act as cover for species such as the California vole, which may be attracted to food resources beneath the barrier but also would be protected from larger predators above the barrier. Chain-link barriers would have no impact on mammals small enough to access the surface through the open pattern; however, medium to large-sized mammals such as skunks, rabbits, and coyotes would lose refuge sites as burrowing by larger mammals is prevented in these areas.

Other impacts would be similar to the potential direct effects of bank stabilization activities described above, including mortality or injury by personnel or equipment; exposure to increased competition from conspecifics as a result of displacement; and exposure to increased levels of predation because of unfamiliarity with the new area, lack of sufficient refugia, or increased numbers of predators.

Invertebrates

Similar to the impacts on invertebrates described for bank stabilization activities above, management of animal conflicts could impact invertebrates by removing larval host plants; killing eggs, larvae, or pupae; causing mortality or injury due to crushing by personnel or equipment; and removing a variety of flowering plants that serve as adult nectar sources. For species such as moths and butterflies, clearing of vegetation could remove larval host plants and nectar sources. For species such as bees that inhabit burrows, the removal or filling of burrows could destroy subterranean nests and their occupants, and clearing of vegetation would reduce pollen and nectar sources. In addition, invertebrate species may be adversely affected by habitat conversion, which could result from the unintentional introduction of nonnative grasses and forbs to work sites.

EVALUATION OF IMPACTS

Impacts on common and special-status fish and wildlife species are assessed based on the potential for individuals or populations of animal species, or their habitat, to be disturbed, degraded, or lost as a result of Program Renewal activities. Impacts on animal populations and communities are evaluated by comparing the quantity and quality of habitat present in the Program Renewal Area under baseline conditions to anticipated conditions following implementation of Program Renewal activities, and by considering the potential for individual activities to affect known and potentially occurring populations of these species.

Impact BIO-1: A substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS (Less than Significant with Mitigation)

Impact BIO-1 describes the Program Renewal's impacts on common and special-status plant and animal species. The analysis is organized by species or groups of species and is based on the information in Tables 3.4-2 and 3.4-3. Species that are not listed in those tables as occurring in the Program Renewal Area are not analyzed below as they would not be impacted by Program Renewal activities.

Impact BIO-1A: Impacts on Serpentine-Associated Special-Status Plant Species (Less than Significant with Mitigation)

IMPACT ASSESSMENT

Serpentine plant communities in the Program Renewal Area support a unique assemblage of plant species, including the following serpentine-associated special-status species that are known to be present or could occur in the Program Renewal Area (see Figure 3.4-2 and Table 3.4-3):

- Tiburon paintbrush
- Coyote ceanothus
- Santa Clara Valley dudleya
- Metcalf Canyon jewel-flower
- Franciscan onion
- Big-scale balsamroot
- Pink creamsacs
- Mt. Hamilton thistle
- Fragrant fritillary
- Loma Prieta hoita
- Woolly-headed lessingia
- Smooth lessingia
- Woodland woollythreads
- Most beautiful jewel-flower

It is also possible that additional serpentine-associated special-status plant species listed as CRPR 1, 2, 3, or 4 by CNPS may be discovered in the Program Renewal Area in the future, and Program Renewal activities could impact those species as well.

Serpentine habitats are known to occur in the larger Program Renewal Area, but surveys by Valley Water have determined these habitats are absent from maintenance activity areas.

Valley Water's 2004 and 2008 surveys of serpentine communities along Program Renewal Area channels detected Mt. Hamilton thistle, smooth lessingia, and most beautiful jewel-flower along Valley Water canals (which are not included in the Program Renewal), but not within Program Renewal work areas. Although none of the remaining serpentine-associated species listed above were detected during the surveys, or are otherwise known to occur within or adjacent to Program Renewal work areas, known populations of these species are present elsewhere in the Program Renewal Area such as on serpentine soils on Coyote Ridge, on Tulare Hill, and in the Santa Teresa Hills (Figure 3.4-2). Since 2008, Valley Water has conducted surveys for special-status plants in Program Renewal work areas as appropriate, both for the SMP and for other Valley Water Program Renewals and projects, yet no serpentine-associated special-status plants have been recorded in areas where Program Renewal activities are expected to occur. Due to the intensity of Valley Water's survey efforts for serpentine communities and associated special-status plant species over the years, both at Valley Water facilities and in general, and because no high-quality serpentine communities have been identified in maintenance work areas, a previously unknown occurrence of these species is not expected to be located in an area where it could be affected by Program Renewal activities. Nevertheless, the possibility that any of the special-status plant species listed above, or additional serpentine-associated special-status plant species that may be detected in the Program Renewal Area in the future, may colonize serpentine habitat adjacent to Program Renewal work areas in the future cannot be eliminated. Thus, there is some possibility that Program Renewal activities may indirectly impact individuals of these species. Known occurrences of serpentine communities in the Program Renewal Area and adjacent to maintenance activity work areas where these species could occur are located along Upper Silver Creek, Coyote Creek, Calero Creek, and West Little Llagas Creek (Figure 3.4-2).

As described under "Impacts on Special-Status Plants" above, maintenance activities could result in a variety of impacts on serpentine-associated special-status plants, including indirect impacts on individuals and temporary and permanent impacts on suitable habitat. Conservation of the non-listed serpentine-associated special-status plant species listed above, which are all CRPR 1B or 3 species, as well as any additional non-listed CRPR 1, 2, 3, or 4 species that may be discovered in the Program Renewal Area in the future, is important because their populations contribute to preserving genetic resources and help ensure persistence of these rare species in the county and state. Due to the regional rarity of these species, Program Renewal impacts that contribute to the extirpation of a population could reduce the species' range or lead to the loss of important genetic diversity, which would be considered a substantial adverse effect and significant under CEQA. Impacts to a very small proportion of a population are not expected to cause the extirpation of that population, as the remaining plants would allow a viable population to persist. Guidelines to minimize impacts of seed collection on wild plant populations suggest that no more than 10 percent of the seeds from a plant population should be collected (Menges et al. 2004, Center for Plant Conservation 2024). Per the VHP, occurrences of annual plant species are assumed to retain long-term viability if the decline in population size and percent cover, relative to pre-activity conditions, is less than 25 percent five years after the activity is conducted; perennial plant occurrences are assumed to retain long-term viability if the decline is less than 25 percent three years after the activity (ICF International 2012). Conservatively, Valley Water has determined that Program Renewal impacts on more than 10 percent of a population (by individuals or occupied area) of non-listed CRPR 1, 2, 3, or 4 species would be considered significant under CEQA because such an impact could contribute to a reduction in these species' genetic resources, or could reduce numbers such that the population may no longer

have enough individuals to be self-sustaining. Impacts on 10 percent or less of a population would not be expected to cause the extirpation of such a population as long as the remaining plants are avoided and protected, as those remaining plants are likely to allow the population to persist and even expand.

Because Tiburon paintbrush, coyote ceanothus, Santa Clara Valley dudleya, Metcalf Canyon jewel-flower, and any other federally endangered species that may be detected in the Program Renewal Area in the future are extremely rare in the region, Valley Water has determined that Program Renewal activities resulting in impacts on any individuals of Tiburon paintbrush or more than 5 percent of a population (by individuals or occupied area) of other listed species would result in a substantial adverse effect on the species and would be considered significant under CEQA. Impacts on 5 percent or less of a population of listed species other than Tiburon paintbrush would not be expected to cause the extirpation of such a population as long as the remaining plants are avoided and protected, as those remaining plants are likely to allow the population to persist and even expand.

Additional indirect effects of Program Renewal activities on serpentine-associated special-status plants can occur due to nitrogen emitted by maintenance vehicles and equipment. Such nitrogen can fertilize serpentine soils and allow nonnative grasses and forbs that would not typically be able to colonize (at least robustly) serpentine habitats to become established and outcompete special-status serpentine plants. There is some potential for nitrogen emitted by maintenance vehicles and equipment to contribute to significant cumulative nitrogen deposition impacts on serpentine-associated special-status plants growing within or downwind of areas where the nitrogen is emitted. Due to the sensitivity of these species, the cumulative impacts of nitrogen deposition, to which this Program Renewal would contribute, would be significant under CEQA.

Applicable BMPs and VHP Conditions

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on serpentine-associated special-status plants due to maintenance activities occurring adjacent to serpentine habitats (as discussed above, no work will occur within serpentine habitats):

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of work area, staging areas, and access routes is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** requires a qualified botanist to identify habitat for special-status plants, including serpentine habitats. Appropriate methods will be used to ensure that maintenance activities avoid all activities within serpentine habitats. In addition, any adjacent serpentine communities would be mapped and delineated in the field, and an appropriate buffer applied to minimize indirect impacts.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants. For activities adjacent to serpentine communities, equipment and tools will be cleaned and sanitized prior to arrival on the site, footwear will be cleaned and disinfected, work will be

scheduled to avoid rainy periods as feasible, and erosion control and revegetation materials will be clean with a low risk of *Phytophthora* contamination.

- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of special-status plants.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-36: Dust Management** requires implementation of measures to reduce dust within and adjacent to work areas, including watering exposed surfaces, covering haul trucks, sweeping streets, and limiting vehicle speeds.
- **BMP REVEG-1: Seeding** would ensure that exposed soils will be stabilized with native seed to prevent erosion.

Most importantly, Valley Water commits to implementing BMP GEN-8 and avoiding all direct and the majority of indirect (with the exception of nitrogen deposition, discussed below) impacts on serpentine communities and species.

VHP-covered Program Renewal activities would be required to comply with the following conditions to avoid and minimize impacts on VHP-covered serpentine-associated special-status plants (i.e., Tiburon paintbrush, coyote ceanothus, Santa Clara Valley dudleya, Metcalf Canyon jewel-flower, Mt. Hamilton thistle, fragrant fritillary, Loma Prieta hoita, smooth lessingia, and most beautiful jewel-flower), and serpentine habitat in the Program Renewal Area:

- **Condition 13. Serpentine and Associated Covered Species Avoidance and Minimization** will help to avoid and minimize Program Renewal impacts on serpentine habitats and associated special-status plants.
- **Condition 19. Plant Salvage when Impacts Are Unavoidable** gives the Habitat Agency the option to salvage seed from VHP-covered special-status plants when impacts cannot be avoided.
- **Condition 20. Avoid and Minimize Impacts to Covered Plant Occurrences** requires pre-activity surveys for VHP-covered special-status plant species and revision of the activity design to avoid impacts, if feasible.

However, with the implementation of BMP GEN-8, which specifies avoidance of direct impacts on serpentine habitats (which do not geographically overlap maintenance activity areas), these conditions are not expected to apply to Program Renewal activities.

The VHP mitigates nitrogen deposition impacts via the payment of nitrogen deposition fees for new vehicle trips. Maintenance activities, such as those under the Program Renewal, are not subject to the payment of these fees; however, these fees are intended to fund all necessary nitrogen-related mitigation for impacts of all VHP-covered activities, including activities that are and are not subject to the payment of nitrogen deposition fees. Therefore, impacts of nitrogen emissions of VHP-covered Program Renewal activities are mitigated by the VHP even though the Program Renewal's nature does not necessitate payment of VHP nitrogen deposition fees.

VHP land cover fees and specialty fees for VHP-covered impacts on serpentine habitats in the Program Renewal Area are not anticipated, as no impacts within these areas would occur.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With the implementation of Program Renewal BMPs, the majority of impacts of VHP-covered Program Renewal activities on VHP-covered serpentine-associated special-status plants and their habitat are less than significant under CEQA. Compliance with serpentine-related VHP conditions and payment of VHP impact fees for serpentine land cover types are not anticipated to be needed, as no direct impacts within serpentine habitats would occur. However, due to the sensitivity of serpentine habitats and the rarity of serpentine-associated special-status plants in the region, to ensure that any residual impacts of Program Renewal activities on these species are reduced to less-than-significant levels, Valley Water will implement Mitigation Measure BIO-1, which specifies the payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for VHP-covered (and non-VHP-covered) activities to reduce effects of nitrogen deposition. With the implementation of this measure, VHP-covered Program Renewal impacts on serpentine-associated special-status plants are less than significant under CEQA.

> **Mitigation Measure BIO-1: Pay Santa Clara Valley Habitat Plan Nitrogen Deposition Fees**
>
> Valley Water will pay VHP Nitrogen Deposition fees for all Program Renewal Activities, regardless of VHP coverage, through the Habitat Agency's Voluntary Fee Payments Policy. The VHP will require the payment of fees in accordance with the number of daily vehicle trips generated by the Program. Valley Water estimates an average of 67 daily vehicle trips will be necessary to support the Program. This estimate is derived from consultation with management of all Valley Water units that currently implement SMP work to determine the estimated average number of daily vehicle trips associated with the Program Renewal work. Therefore, Valley Water will pay the nitrogen deposition fee associated with 67 daily vehicle trips.

Activities Not Covered under the VHP

Herbicide application, which is not covered under the VHP, would be avoided directly in serpentine areas per BMP GEN-8, and indirect impacts would be minimized by observing an appropriate non-disturbance buffer around serpentine areas. Thus, with the implementation of BMPs and compliance with applicable regulations, herbicides would not be applied in locations where serpentine-associated special-status plants are present, or in nearby areas using methods that could result in indirect impacts on these species, and impacts of herbicide application on serpentine-associated special-status plants would be less than significant under CEQA. No mitigation measures are necessary.

No maintenance activities within tidal portions of the Program Renewal Area will result in direct adverse effects on serpentine-associated special-status plants, as serpentine habitats do not occur within or near tidal reaches of the Program Renewal Area. For other non-VHP-

covered maintenance activities, Valley Water avoids conducting maintenance activities in serpentine areas, and indirect effects on these areas are effectively minimized through BMPs. Thus, with the implementation of BMPs, the majority of impacts of non-VHP-covered Program Renewal activities on serpentine-associated special-status plants would be less than significant under CEQA. However, due to the sensitivity of serpentine habitats and the rarity of serpentine-associated special-status plants in the region, to ensure that any residual impacts of nitrogen deposition from Program Renewal activities on these species are reduced to less-than-significant levels, Valley Water will implement Mitigation Measure BIO-1, which specifies the payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for non-VHP-covered (and VHP-covered) activities to reduce effects of nitrogen deposition.

SUMMARY AND CONCLUSION

Program Renewal activities could result in significant indirect impacts on serpentine-associated special-status plants due to the loss of substantial numbers of individuals (greater than 10 percent of a population of non-listed CRPR 1, 2, 3, or 4 species and greater than 5 percent of a population of state or federally listed species). However, for all Program Renewal activities (regardless of VHP coverage), BMPs will ensure that indirect impacts are effectively minimized. In addition, Valley Water will implement Mitigation Measure BIO-1, which specifies payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for all Program Renewal activities (regardless of VHP coverage) to reduce effects of nitrogen deposition.

For both VHP-covered and non-VHP-covered activities, with the implementation of Program Renewal BMPs and Mitigation Measure BIO-1, impacts on VHP-covered serpentine-associated special-status plants are less than significant under CEQA.

Impact BIO-1B: Impacts on Non-Serpentine-Associated Special-Status Plant Species (Less than Significant with Mitigation)

Non-serpentine-associated special-status plant species are discussed together because BMPs to protect these species are similar, and mitigation is required to reduce impacts of the Program Renewal on these species to less-than-significant levels under CEQA.

IMPACT ASSESSMENT

A number of special-status plants that are typically not associated with serpentine communities (or not strongly associated with these communities) and instead occur in communities such as valley and foothill grasslands, wetlands/seeps, and salt marshes are known to be present or could occur in the Program Renewal Area (see Figure 3.4-14 and Table 3.4-3), as follows:

- Anderson's manzanita
- Alkali milk-vetch
- Brittlescale
- Congdon's tarplant
- Santa Clara red ribbons
- San Francisco collinsia

- Point Reyes bird's beak
- Hospital Canyon larkspur
- Western leatherwood
- Small spikerush
- Hoover's button-celery
- Satan's goldenbush
- Arcuate bush-mallow
- Hall's bush-mallow
- Prostrate vernal pool navarretia
- Saline clover

It is also possible that additional non-serpentine-associated special-status plant species listed as CRPR 1, 2, 3, or 4 by CNPS may be discovered in the Program Renewal Area in the future, and Program Renewal activities could impact those species as well.

Of the special-status plant species listed above that are known to be present in the Program Renewal Area, Congdon's tarplant, Santa Clara red ribbons, San Francisco collinsia, western leatherwood, and Hall's bush-mallow are known from a number of locations in the Program Renewal Area and could occur within and adjacent to maintenance work areas. Anderson's manzanita, brittlescale, alkali milk-vetch, Point Reyes bird's beak, Hospital Canyon larkspur, small spikerush, Satan's goldenbush, Hoover's button-celery, arcuate bush-mallow, prostrate vernal pool navarretia, and saline clover are unlikely to occur in the Program Renewal Area and within maintenance activity work areas due to a lack of known records in the region or because the species' occurrences are localized in portions of the Program Renewal Area where maintenance activities will not occur. However, suitable habitat for these species is present in localized areas along Program Renewal channels, and the possibility that Program Renewal activities would impact individuals of these species cannot be ruled out.

As described under "Impacts on Special-Status Plants" above, maintenance activities can result in a variety of impacts on non-serpentine-associated special-status plants, including direct and indirect impacts on individuals and temporary and permanent impacts on suitable habitat. As discussed above, based on Valley Water surveys for special-status plants conducted for prior SMP activities and other purposes, special-status plants are not currently known to occur in Program Renewal work areas. Because the majority of the Program Renewal's impacts will occur within existing PMAs (for sediment removal, aquatic herbicide application, and vegetation management) where Program Renewal activities have been ongoing for many years, as well as within areas where maintenance occurs annually (for mechanical mowing and hand weed abatement), the potential for maintenance activities to result in the loss of occupied habitat for special-status plants is extremely low, and any such impacts would be very limited.

Conservation of non-listed special-status plant species (including those listed above and other CRPR 1, 2, 3, or 4 species that may be discovered in the Program Renewal Area in the future) is important because their populations contribute to preserving genetic resources and help ensure persistence of these rare species in the county and state. Due to the regional

rarity of these species, Program Renewal impacts that could lead to the extirpation of a population could reduce the species' range or lead to the loss of important genetic diversity, which would be considered a substantial adverse effect and therefore significant under CEQA. Impacts to a very small proportion of a population is not expected to cause the extirpation of that population, as the remaining plants would allow a viable population to persist. Guidelines to minimize impacts of seed collection on wild plant populations suggest that no more than 10 percent of the seeds from a plant population should be collected (Menges et al. 2004, Center for Plant Conservation 2024). Per the VHP, occurrences of annual plant species are assumed to retain long-term viability if the decline in population size and percent cover, relative to pre-activity conditions, is less than 25 percent five years after the activity is conducted; perennial plant occurrences are assumed to retain long-term viability if the decline is less than 25 percent three years after the activity (ICF International 2012). Conservatively, Valley Water has determined that Program Renewal impacts on more than 10 percent of a population (by individuals or occupied area) of non-listed CRPR 1, 2, 3, or 4 species would be considered significant under CEQA because such an impact would contribute to a reduction in these species' genetic resources, or could reduce numbers such that the population may no longer have enough individuals to be self-sustaining. Impacts to 10 percent or less of a population would not be expected to cause the extirpation of such a population as long as the remaining plants are avoided and protected, as those remaining plants are likely to allow the population to persist and even expand.

Because state and federally listed species are extremely rare in the region, Valley Water has determined that Program Renewal activities resulting in impacts on more than 5 percent of a population (by individuals or occupied area) would result in a substantial adverse effect on the species and would be considered significant under CEQA. Impacts on 5 percent or less of a population of listed species would not be expected to cause the extirpation of such a population as long as the remaining plants are avoided and protected, as those remaining plants are likely to allow the population to persist and even expand.

Applicable BMPs and VHP Conditions

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on non-serpentine-associated special-status plants:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** requires a qualified botanist to identify habitat for special-status plants. Appropriate methods will be used to ensure that maintenance activities avoid and minimize impacts on these species.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of special-status plants.

- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-36: Dust Management** requires implementation of measures to reduce dust within and adjacent to work areas, including watering exposed surfaces, covering haul trucks, sweeping streets, and limiting vehicle speeds.
- **BMP REVEG-1: Seeding** would ensure that exposed soils will be stabilized with native seed to prevent erosion.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions protect the non-serpentine-associated special-status plants that potentially occur within the Program Renewal Area, as none of these species are covered under the VHP or are listed as fully protected in California (such that VHP Condition 1 would apply). However, as discussed in the VHP and in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County, including many rare plant species, in addition to the species that are explicitly "covered species" under the VHP. In particular, the VHP's EIR analyzed potential impacts of VHP-covered future development as well as anticipated VHP conservation on Hall's bush-mallow, because that species had been considered for possible VHP coverage. The EIR stated that the reserve system would have a net benefit to Hall's bush-mallow due to the preservation of more than 400 acres of suitable habitat for the species – which were assumed to support the species – as well as enhancement of habitat conditions in the reserve system from planned management activities (USFWS et al. 2012). Based on the distribution of Hall's bush-mallow in Santa Clara County and the presence of known populations of this species within the reserve system (Calflora 2024), the reserve system is expected to benefit this species more than VHP-covered activities will impact the species. The Habitat Agency's management of occupied habitat will enhance that habitat for Hall's bush-mallow and ensure the long-term persistence of healthy populations of this species. Based on the known occurrence and abundance of this species in Habitat Agency reserves, the conservation benefits resulting from Valley Water's payment of VHP impact fees (i.e., management of habitat occupied by Hall's bush-mallow by the Habitat Agency) would offset any minor impacts of the Program Renewal on this species.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats in the Program Renewal Area. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at these habitats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. None of these non-serpentine-associated special-status plant species would then be covered by the VHP. However, based on the limited extent of anticipated Program Renewal impacts within suitable habitat for Hall's bush-mallow, as well as the known occurrence and abundance of this species in Habitat Agency reserves, the conservation benefits resulting from Valley Water's payment of VHP impact fees (i.e.,

management of habitat occupied by woodland woollythreads by the Habitat Agency) would offset any minor impacts of the Program Renewal on this species. Thus, with the implementation of BMPs and compliance with VHP conditions (including payment of VHP impact fees), impacts of VHP-covered Program Renewal activities on Hall's bush-mallow are less than significant, and no mitigation measures are necessary.

With the implementation of Program Renewal BMPs, impacts of VHP-covered Program Renewal activities on other non-serpentine-associated special-status plants would be avoided and minimized to the extent feasible. However, if complete avoidance is not feasible, impacts on these species could occur. The remaining non-serpentine-associated special-status plant species that could be impacted by Program Renewal activities (i.e., Anderson's manzanita, alkali milk-vetch, brittlescale, Congdon's tarplant, Santa Clara red ribbons, San Francisco collinsia, Point Reyes bird's beak, Hospital Canyon larkspur, western leatherwood, small spikerush, Hoover's button-celery, Satan's goldenbush, arcuate bush-mallow, prostrate vernal pool navarretia, saline clover, and other non-VHP-covered CNPS 1–4 species that may be detected in the Program Renewal Area in the future) may not be adequately conserved solely via VHP compliance because populations in VHP preserves are not known to be adequate to offset Program Renewal impacts. Although VHP preserves (including current reserves and future land acquisitions) could possibly support some of these species, that is less certain than is the case with Hall's bush-mallow, discussed above. Therefore, it cannot be assumed that compliance with the VHP would necessarily result in conservation of these species, including any species that are not currently known or expected to occur but that may be detected within the Program Renewal Area in the future, that is sufficient to offset the Program Renewal's impacts, and residual impacts would remain due to potential direct and indirect effects of VHP-covered activities on these special-status plant species that result in substantial (i.e., populations-level) impacts. If non-VHP-covered CRPR 1–4 special-status plant species for which VHP reserves do not adequately offset Program Renewal impacts by a proposed activity such that population-level impacts would occur, and (as discussed under "Impact Assessment" above) more than 5 percent of a population (by occupied area or individuals) of a listed species or more than 10 percent of a population (by occupied area or individuals) of a non-listed species will be impacted as determined by a qualified plant ecologist, such impacts would be significant under CEQA. With the implementation of Mitigation Measure BIO-2, VHP-covered Program Renewal impacts on non-serpentine-associated special-status plants would be less than significant under CEQA.

Mitigation Measure BIO-2. Create or Enhance and Preserve Mitigation Populations of Non-VHP-Covered Special-Status Plant Species

If avoidance of non-VHP-covered special-status plants is not feasible as determined by Valley Water biologists and other staff (e.g., planners, engineers, construction supervisors), and more than 5 percent of a population (by occupied area or individuals) of a listed species or more than 10 percent of a population (by occupied area or individuals) of non-listed CNPS 1–4 species that may be detected in the Program Renewal Area in the future (and for which the Habitat Agency's reserve system does not support sufficient populations to offset Program Renewal impacts) would be impacted, Valley Water will provide compensatory mitigation via the creation, enhancement, or preservation of occupied habitat for the impacted species. Creation of habitat and establishment of a new population would be provided at a minimum 1.5:1 (mitigation: impact) ratio; preservation and enhancement of an

existing population would be provided at a minimum 1:1 (mitigation: impact) ratio. If mitigation occurs through creation of a new population, seed from the population to be impacted may be harvested (or seed may be obtained from another source at an appropriate location, as determined by a qualified biologist) and used either to expand an existing population or to establish an entirely new population in suitable habitat.

A habitat mitigation and monitoring plan (HMMP) will be developed and implemented by Valley Water and implemented for the mitigation lands for a minimum of 10 years. That plan will include, at a minimum, the following information:

- a summary of impacts to the special-status plant species in question, including impacts to its habitat, and the proposed mitigation;
- a description of measures to be undertaken to enhance (e.g., through focused management that may include removal of invasive species in adjacent suitable but currently unoccupied habitat, or other appropriate methods such as grazing, prescribed burns, planting native species, or mowing) the mitigation site for the species;
- a description of measures to transplant individual plants or seeds from the impact area to the mitigation site, if appropriate (which will be determined by a qualified biologist, who will take into account factors such as genetics and the spread of pathogens, such as *Phytophthora*);
- proposed management activities to maintain high-quality habitat conditions for the species;
- a description of habitat and species monitoring measures on the mitigation site. At a minimum, performance criteria will include demonstration that any plant population fluctuations over the monitoring period of a minimum of 10 years do not indicate a downward trajectory in terms of reduction in numbers and/or occupied area for the preserved mitigation population that can be attributed to management (i.e., that are not the result of local weather patterns, as determined by monitoring of a nearby reference population, or other factors unrelated to management).
- contingency measures for mitigation elements that do not meet performance criteria.

Activities Not Covered under the VHP

With the implementation of Program Renewal BMPs, impacts of non-VHP-covered Program Renewal activities on non-serpentine-associated special-status plants would be avoided and minimized to the extent feasible. However, if complete avoidance is not feasible, impacts on these species could occur.

Herbicide application, which is not covered under the VHP, could affect non-serpentine-associated special-status plants in the Program Renewal Area. However, such herbicide use would only be performed with approval by a qualified biologist. In addition, per BMP GEN-8, prior to conducting herbicide use, individual special-status plants would be identified during pre-activity surveys and, if any individuals are found, the qualified biologist would recommend appropriate measures (e.g., maintaining a no-disturbance buffer or adjusting the timing of activities) to avoid and minimize effects on individuals. BMP GEN-8 also specifies that a qualified biologist will determine if a given type of vegetation management is ecologically appropriate, and alternative strategies will be considered based on the biologist's recommendations. With the implementation of these BMPs, direct and indirect impacts of herbicides on special-status plants would be minimized. Thus, with the implementation of BMPs, impacts of herbicide application on special-status plants would be less than significant under CEQA, and no mitigation measures are necessary.

As discussed for VHP-covered activities above, if Anderson's manzanita, alkali milk-vetch, brittlescale, Congdon's tarplant, Santa Clara red ribbons, San Francisco collinsia, Point Reyes bird's beak, Hospital Canyon larkspur, western leatherwood, small spikerush, Hoover's button-celery, Satan's goldenbush, Hall's bush-mallow, arcuate bush-mallow, prostrate vernal pool navarretia, saline clover, and any additional non-VHP-covered CRPR 1–4 species that may be detected in the Program Renewal Area in the future will be impacted by a proposed activity, and (as discussed under "Impact Assessment" above) more than 5 percent of a population (by individuals or occupied area) of a listed species or more than 10 percent of a population (by individuals or occupied area) of a non-listed species will be impacted as determined by a qualified plant ecologist, such impacts would be significant under CEQA. With the implementation of Mitigation Measure BIO-2, non-VHP-covered Program Renewal impacts on non-serpentine-associated special-status plants would be less than significant under CEQA.

SUMMARY AND CONCLUSION

Program Renewal activities can result in significant impacts on non-serpentine-associated special-status plants due to the loss of individuals. For all Program Renewal activities (regardless of VHP coverage), BMP GEN-8 will ensure that maintenance activities avoid and minimize impacts on special-status plants. Nevertheless, impacts on these species could occur. The loss of individuals or degradation of health of federally listed populations such that a population-level impact would occur would constitute substantial adverse effect on the species and would be considered significant under CEQA. Conservatively, Valley Water has determined that Program Renewal impacts on more than 5 percent of a population (by individuals or occupied area) of listed special-status plant species or 10 percent of a population (by individuals or occupied area) of non-listed special-status plant species would be considered significant under CEQA.

For VHP-covered activities, no VHP conditions protect the non-serpentine-associated special-status plants that potentially occur within the Program Renewal Area, as none of these species are covered under the VHP or are listed as fully protected in California (such that VHP Condition 1 would apply). Nevertheless, the payment of VHP land cover fees by Valley Water will benefit Hall's bush-mallow, and VHP-covered Program Renewal impacts on this species would be less than significant under CEQA. If CRPR 1–4 species for which VHP reserves do not adequately offset Program Renewal impacts by a proposed activity, and any individuals of a listed species or more than 10 percent of a population (by occupied area

or individuals) of a non-listed species will be impacted as determined by a qualified plant ecologist, Mitigation Measure BIO-2 will be implemented to reduce these impacts to less-than-significant levels under CEQA.

For non-VHP-covered activities, BMPs will avoid and minimize impacts of herbicide application on non-serpentine-associated special-status plants, and this impact is less than significant under CEQA. However, if CRPR 1–4 species will be impacted by a proposed activity, and more than 5 percent of a population (by occupied area or individuals) of a listed species (such that a population-level impact would occur) or more than 10 percent of a population (by occupied area or individuals) of a non-listed species will be impacted as determined by a qualified plant ecologist, Mitigation Measure BIO-2 will be implemented to reduce these impacts to less-than-significant levels under CEQA.

Impact BIO-1C: Impacts on the Monarch Butterfly, Crotch's Bumble Bee, and Large Marble Butterfly (Less than Significant)

The monarch butterfly, Crotch's bumble bee, and large marble butterfly are discussed together because Program Renewal impacts on these species are similar, and no mitigation measures are necessary to reduce impacts of the Program Renewal on these species to less-than-significant levels under CEQA.

IMPACT ASSESSMENT

The monarch butterfly forages on floral resources in open habitats throughout the Program Renewal Area, especially during spring and fall migration. This species is not known to form communal wintering roosts anywhere in Santa Clara County, and due to recent population declines it is expected to occur only in low numbers in any given area. Where milkweeds (*Asclepias* spp.) are present, individuals could breed in maintenance activity areas. However, focused surveys by Valley Water have identified limited numbers of milkweeds within Program Renewal work areas. These surveys have mapped concentrations of milkweeds along Flint Creek upstream of Mount Pleasant Road, along Norwood Creek upstream of Slopeview Drive, along Ruby Creek from Murillo Avenue to Klein Road, along Berryessa Creek upstream of Old Piedmont Road, along Randol Creek near Valley Quail Circle, and along the west branch of Llagas Creek from Spring Avenue to Ciolion Avenue. In addition, H. T. Harvey & Associates biologists noted patches of milkweed along Llagas Creek north of Highway 152 and along West Little Llagas Creek in between Llagas Road and Watsonville Road during 2023 surveys conducted as part of the Program Renewal's wetland delineation. Because milkweeds do not grow in heavily shaded areas, Program Renewal impacts on milkweeds (and any associated impacts on monarch butterflies and their habitat) are expected to occur outside of dense riparian habitats and areas dominated by woody shrubs along Program Renewal channels. However, milkweed can be concentrated along streams in the Program Renewal Area, including on gravel bars below top of bank. Thus, maintenance activities within the bed and banks of channels could affect this species in unshaded areas below top of bank.

Crotch's bumble bee similarly forages on floral resources in open habitats throughout the Program Renewal Area during its flight season (approximately February-March to August-September). This species nests in inactive small mammal burrows and crevices underground, and queens winter underground (Xerces Society for Invertebrate Conservation 2018). In the Program Renewal Area, the species is known from several locations along the edges of the San Francisco Bay, a few scattered locations in urban areas,

and from multiple locations in low foothills of the Diablo Range and Santa Cruz Mountains such as Santa Teresa County Park, Anderson Lake County Park, and Coyote Lake County Park (Bumble Bee Watch 2024, iNaturalist 2024). Channels in the Program Renewal Area may not support ideal habitat for Crotch's bumble bee due to the limited availability of foraging resources in some areas and high winter water tables, and habitats in maintenance activity areas are more likely to be used by this species where channels abut more natural areas that support extensive floral resources (e.g., along the edges of the San Francisco Bay and along inland open habitats and parks). Based on known locations of this species in the Program Renewal Area, there is no evidence that Crotch's bumble bee populations are concentrated along streams.

The large marble butterfly forages on floral resources in open habitats throughout the Program Renewal Area during its flight season from approximately mid-April until June or early July. Where mustards (family Brassicaceae) are present, individuals could breed in maintenance activity areas. In the Program Renewal Area, the species is known from several locations along the edges of the San Francisco Bay, the foothills of the Santa Cruz Mountains, and the foothills of the Diablo Range (Creekside Science 2024, iNaturalist 2024). Levee slopes with abundant mustards provide suitable habitat for the large marble butterfly, although habitats in maintenance activity areas are more likely to be used by this species where channels abut more natural areas that support extensive floral resources (e.g., along the edges of the San Francisco Bay and along inland open habitats and parks). However, based on known locations of this species in the Program Renewal Area, there is no evidence that large marble butterfly populations are concentrated along streams.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities can result in a variety of impacts on invertebrates such as the monarch butterfly, Crotch's bumble bee, and large marble butterfly including direct and indirect impacts on individuals and temporary and permanent impacts on suitable host plants and foraging habitat. Program Renewal activities can result in temporary direct impacts on individuals through the alteration of foraging patterns (e.g., avoidance of work sites because of increased noise and activity levels during maintenance activities); however, these activities would not result in the loss of foraging adults, as such individuals would move away from any work areas or equipment before they could be injured or killed.

Maintenance activities would affect breeding and foraging habitat for monarch butterflies, Crotch's bumble bees, and large marble butterflies where suitable floral resources (for foraging), milkweed host plants (for breeding by monarch butterflies), mustards (for breeding large marble butterflies), and/or inactive burrows and crevices (for breeding by Crotch's bumble bees) are present within and adjacent to work areas. Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within riparian and upland habitats potentially supporting suitable habitat for these species. The maintenance activity with the greatest potential to affect habitat for these species is vegetation management, especially mowing, which can remove concentrations of flowering plants, mustards, and/or milkweeds. The introduction of nonnative vegetation would also affect habitat quality for these species, although all of these species make use of nonnative plants for nectaring. Maintenance of Program Renewal Areas by mowing can also benefit monarch butterflies, large marble butterflies, and Crotch's bumble bees by preventing overgrowth of woody vegetation. If mowing occurs in early spring, it can also stimulate the growth of herbaceous flowering plants, including milkweeds and mustards, within the mowing areas. In contrast, mowing that occurs later in the spring and summer when

herbaceous species, including milkweeds and mustards, are flowering, can remove these plants and adversely affect habitat for these species. In addition, mowing activities are primarily located in urban areas, where the risk of fire is a greater concern and Crotch's bumble bees and large marble butterflies are less likely to occur. Thus, the likelihood that mowing activities would affect populations of Crotch's bumble bees and large marble butterflies is relatively low, as these species are concentrated around the periphery of the Program Renewal Area and not along channels; however, there is a possibility that mowing would result in adverse effects on populations of monarch butterflies where milkweeds are present.

Because breeding and foraging habitats for the large marble butterfly and Crotch's bumble bee, as well as foraging habitats for the monarch butterfly, are extensively available in the Program Renewal Area vicinity; implementation of the Program Renewal is not expected to remove or degrade large areas of habitat such that regional populations of these species would be impacted; and Program Renewal activities would only impact a small proportion of habitats where these species occur, Program Renewal impacts on breeding and foraging habitats for the large marble butterfly and Crotch's bumble bee (including breeding host plants for the large marble), as well as foraging habitats for the monarch butterfly, are considered less than significant under CEQA. However, monarch butterfly impacts caused by vegetation management activities (especially mowing) that remove or degrade areas of milkweed habitat would be significant under CEQA due to the decreasing populations of monarch butterflies in the region as well as their reliance on milkweeds along Program Renewal Area streams for breeding.

Maintenance activities such as vegetation management (e.g., for mowing or site access) and grading activities (e.g., for bank stabilization) that result in the destruction of milkweeds or mustards supporting monarch eggs or larvae (on milkweeds) or large marble butterfly eggs or larvae (for mustards) would result in the loss of individual monarch butterflies or large marble butterflies. Herbicides used for vegetation management may also adversely affect monarch and/or large marble butterfly eggs or larvae present on milkweeds. Due to recent declines in populations of the monarch butterfly, as well as this species' concentration along Program Renewal Area channels, Program Renewal impacts due to the loss of individual eggs and larvae on milkweeds that result in substantial (i.e., population-level) impacts would be considered significant under CEQA. However, because large marble butterfly populations are concentrated along natural areas on the periphery of the Program Renewal Area, vegetation management activities within these areas would be limited, and the species utilizes common mustards for breeding (which are widespread in the Program Renewal Area), maintenance activities along channels, including mowing and other vegetation management activities, are not expected to result in significant effects on local populations.

Maintenance activities that result in the destruction of Crotch's bumble bee nests, which are typically located in inactive burrows or crevices underground, would result in the loss of individual Crotch's bumble bees. Crotch's bumble bees located in nests may be killed or injured due to trampling by construction personnel or equipment. In addition, clearing and grading for access roads and staging areas could result in the direct loss of individuals through the disturbance of areas that support burrows. Because Valley Water targets active small mammal burrows for destruction (as opposed to inactive burrows where bumble bees may nest), burrow destruction and filling is unlikely to result in the direct loss of individuals or active nests; however, the possibility that individuals or nests would be present in burrows that are filled/destroyed cannot be ruled out. Small mammal control would reduce

the availability of burrows for this species, potentially resulting in the long-term degradation of nesting and overwintering habitat for Crotch's bumble bees (to the extent that this species uses burrows in levees that would be managed by Valley Water). Herbicides used for vegetation management may also adversely affect Crotch's bumble bees. Because Crotch's bumble bee is a candidate for listing under CESA and is scarce in the region, Program Renewal impacts due to the loss of individuals in nests that results in a substantial (i.e., population-level) impact would be considered significant under CEQA.

APPLICABLE BMPS AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on monarch butterflies, Crotch's bumble bees, and their habitats:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-9: Protection of Monarch Butterflies** will ensure that milkweed within or near work areas is identified, appropriate vegetation management methods are used, and that either maintenance activities occur between September 1 and March 1 when monarch eggs and larvae are absent or a pre-activity survey is performed to ensure eggs and larvae are avoided.
- **BMP GEN-10: Protection of Crotch's Bumble Bees** requires non-VHP-covered Program Renewal activities to follow the procedures in the *Final Program Renewal Crotch's Bumble Bee Avoidance Plan* (Valley Water 2024b), which include staff training, pre-activity habitat assessments and surveys for Crotch's bumble bees prior to the start of work, biological monitoring if Crotch's bumble bee individuals or nests are detected, and avoidance of any active nests that are detected.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of the monarch butterfly, large marble butterfly, and Crotch's bumble bee.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-36: Dust Management** requires implementation of measures to reduce dust within and adjacent to work areas, including watering exposed surfaces, covering haul trucks, sweeping streets, and limiting vehicle speeds.
- **BMP REVEG-1: Seeding** would ensure that exposed soils will be stabilized with native seed to prevent erosion.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions currently protect the monarch butterfly, large marble butterfly, Crotch's bumble bee, or their habitat in the Program Renewal Area, as these

species are not currently covered under the VHP or are listed as fully protected in California (such that VHP Condition 1 would apply). However, all of these species are proposed for VHP coverage in the amendment currently being processed, so these species may be formally covered by the VHP once the amendment is approved. At that time, Valley Water would comply with any VHP conditions specific to these species. Once the Program Renewal is covered under the VHP, for Program Renewal activities covered by the VHP, any species-specific protections and survey requirements provided in the new VHP conditions will replace the protections outlined in BMPs GEN-9 and GEN-10 above, as applicable.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County; if and when these species are added to the VHP as covered species, the conservation Program Renewal is expected to include additional, species-specific measures to benefit these species.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With the implementation of Program Renewal BMPs and compliance with any applicable VHP conditions (should the monarch butterfly, large marble butterfly, and/or Crotch's bumble bee be covered under the VHP in the future), impacts of VHP-covered Program Renewal activities on individuals of these species and their habitats would be less than significant under CEQA, and no mitigation measures are necessary.

Valley Water would pay VHP impact fees for VHP-covered impacts on natural land cover types that provide breeding and foraging habitat for monarch butterflies, large marble butterflies, and Crotch's bumble bees in the Program Renewal Area; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats. The monarch butterfly, large marble butterfly, and Crotch's bumble bee will benefit from the VHP conservation Program Renewal (i.e., the preservation, enhancement, and management of numerous habitat types throughout the VHP Reserve System) to which Valley Water would contribute via payment of VHP impact fees. As discussed in the VHP and in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County, including many common and rare animal species. The VHP's vast conservation Program Renewal would conserve lands that support populations of these two species due to its breadth, both geographically and in terms of the diversity of habitat types to be conserved. For example, narrow-leaved milkweed, the primary native larval host plant of the monarch butterfly, is common and widespread in the county, and it occurs on a variety of lands in the VHP's conservation areas. Similarly, Crotch's bumble bee is a generalist forager, using a vast array of flowering plants (Thorp et al. 1983), and the large marble butterfly is similarly a generalist forager. VHP conservation lands are expected to support Crotch's bumble bee and large marble butterfly populations, given the geographic spread of recent occurrences in the county, as well as high-quality habitat for these species. Thus, management of these lands by the VHP will enhance, sustain, and protect the value of this habitat to the monarch butterfly, large marble

butterfly, and Crotch's bumble bee. Therefore, with the payment of VHP fees and compliance with the VHP's conditions, Program Renewal impacts on these species from VHP-covered activities would be less than significant. No mitigation measures are necessary.

Activities Not Covered under the VHP

Impacts of the Program Renewal on individual large marble butterflies are less than significant under CEQA. With the implementation of Program Renewal BMPs, impacts of non-VHP-covered Program Renewal activities on individual monarch butterflies and Crotch's bumble bees would be effectively avoided and minimized, and these impacts are also less than significant under CEQA. Because breeding and foraging habitats for the large marble butterfly and Crotch's bumble bee, as well as foraging habitats for the monarch butterfly, are extensively available in the Program Renewal Area vicinity, and implementation of the Program Renewal is not expected to remove or degrade large areas of habitat such that regional populations of these species would be impacted, non-VHP-covered Program Renewal impacts on these habitats are considered less than significant under CEQA. With the implementation of BMPs to avoid patches of milkweeds in maintenance activity areas, Program Renewal impacts on breeding habitat for monarch butterflies would also be less than significant under CEQA. Thus, with the implementation of BMPs, no mitigation measures for Program Renewal impacts on the monarch butterfly, large marble butterfly, Crotch's bumblebee, and their habitats are necessary.

Herbicide application, which is not covered by the VHP, could affect monarch butterflies, large marble butterflies, and Crotch's bumble bees in the Program Renewal Area. However, such herbicide use would only be performed with approval by a qualified biologist. In addition, BMPs will ensure that herbicide application avoids milkweeds and nests of Crotch's bumble bees in the Program Renewal Area. Thus, with the implementation of BMPs, impacts of herbicide application on monarch butterflies, large marble butterflies, and Crotch's bumble bees would be less than significant under CEQA, and no mitigation measures are necessary.

SUMMARY AND CONCLUSION

Impacts of Program Renewal activities on the large marble butterfly and its habitats are less than significant under CEQA, and no mitigation measures are necessary.

Program Renewal activities could result in impacts on monarch butterflies and Crotch's bumble bees due to the loss of individuals. Because breeding and foraging habitats for the large marble butterfly and Crotch's bumble bee, as well as foraging habitats for the monarch butterfly, are extensively available in the Program Renewal Area, and implementation of the Program Renewal is not expected to remove or degrade large areas of habitat such that regional populations of these species would be impacted, Program Renewal impacts on these habitats are less than significant under CEQA. No mitigation measures are necessary.

For VHP-covered activities, no VHP conditions protect the monarch butterfly, large marble butterfly, or Crotch's bumble bee, as none of these species are covered under the VHP. Nevertheless, with the implementation of Program Renewal BMPs, compliance with applicable VHP conditions (should VHP conditions apply to these species in the future), and payment of VHP impact fees, impacts of VHP-covered Program Renewal impacts on the monarch butterfly, large marble butterfly, and Crotch's bumble bee are less than significant

under CEQA, and no mitigation measures are necessary. In addition, the payment of VHP land cover fees by Valley Water will benefit these species by contributing to the VHP's conservation Program Renewal.

For non-VHP-covered activities, with the implementation of Program Renewal BMPs, impacts on the monarch butterfly, large marble butterfly, and Crotch's bumble bee are less than significant under CEQA, and no mitigation measures are necessary.

Impact BIO-1D: Impacts on Steelhead (Less than Significant with Mitigation)

IMPACT ASSESSMENT

The federally listed CCC and SCCC steelhead rely on adequate instream flows, water temperatures, water depths, and velocities; appropriate spawning and rearing substrates (e.g., spawning gravels); and availability of instream cover and food for survival in the creeks of the Program Renewal Area (see Table 3.4-4). CCC and SCCC steelhead use riverine habitat for spawning, rearing, and migration and they may use estuarine habitats for migration. Within the Program Renewal Area, CCC steelhead are known to occur in, and suitable spawning habitat is present in, San Francisquito Creek, Los Trancos Creek, Stevens Creek, the Guadalupe River, Los Gatos Creek, Guadalupe Creek, Alamitos Creek, Calero Creek, Coyote Creek, Upper Penitencia Creek, and Arroyo Aguague (Leidy et al. 2005, NMFS 2005, Stanford University 2009, NMFS 2024) (Figure 3.4-15). SCCC steelhead are known to occur within the Program Renewal Area in the Pajaro River, Pescadero Creek, Tar Creek, Uvas/Carnadero Creek, Bodfish Creek, Little Arthur Creek, Llagas Creek, Pacheco Creek, Cedar Creek, and South Fork Pacheco Creek (Casagrande 2010, Smith 2007) (Figure 3.4-15). While Figure 3.4-15 indicates the geographic areas where maintenance activities are most likely to occur in steelhead habitat, activities could occur along steelhead streams throughout the Program Renewal Area.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities could result in a variety of impacts on special-status fish such as steelhead, including direct and indirect impacts on individuals and temporary and permanent impacts on suitable habitat. Because CCC and SCCC steelhead could spawn, rear, and migrate within Program Renewal Area streams, Program Renewal activities could affect the survival, reproduction, and/or growth of these species where they occur in the Program Renewal Area, depending on their use of the affected reach. For example, along reaches used solely for migration between spawning/rearing locations and San Francisco Bay or the Pacific Ocean, Program Renewal activities would be unlikely to have a substantial impact regardless of the maintenance activity. Conversely, maintenance activities that occur within spawning or rearing habitat, or upstream from such habitats, may have substantial effects on steelhead and their habitats. If maintenance activities are located near spawning or rearing habitats, steelhead fry and juveniles may be present in work areas when maintenance activities occur. As discussed under "Impacts on Common and Special-Status Fish and Wildlife" above, fish within the work area would be subject to injury and mortality and would be considered significant under CEQA. Furthermore, individuals present during in-water work activities may be subject to changes in stream temperature, water quality, and stranding related to channel dewatering causing an increased risk of mortality. Therefore, due to the potential for direct injury or mortality of federally listed steelhead within the Program Renewal Area during in-water maintenance activities such that a

substantial (i.e., population-level) impact would occur, Program Renewal impacts on the CCC and SCCC steelhead would be considered significant under CEQA.

The total estimated acreages of Program Renewal impacts along streams where steelhead potentially occur are provided in Table 3.4-7. Of these, impacts to vegetated wetlands along streams (120.7 acres of CCC steelhead habitat and 38.9 acres of SCCC steelhead habitat) and aquatic (riverine) habitat (20.6 acres of CCC steelhead habitat and 9.6 acres of SCCC steelhead habitat) would occur within steelhead habitat; impacts to herbaceous streambank vegetation (258.0 acres along CCC steelhead streams and 63.7 acres along SCCC steelhead streams) and woody riparian vegetation (24.8 acres along CCC steelhead streams and 7.8 acres along SCCC steelhead streams) would occur on stream banks within or directly upslope of steelhead habitat; and impacts to other (non-developed upland) habitat (237.1 acres along CCC steelhead streams and 54.9 acres along SCCCC streams) would occur outside of the stream channel. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

Within the lower Guadalupe River in the Santa Clara Basin, 1,660 linear feet of the projected sediment removal work is located within specific sediment deposition reaches that are designed to capture sediment when flows exceed capacity of the main channel. These reaches run outside of, but parallel to, the main channel, and allow sediment removal activities to occur without impacting CCC steelhead that may be present within the Guadalupe River. The estimated impacts of sediment removal on habitat for CCC steelhead provided in Table 3.4-7 have been adjusted to account for these sediment deposition reaches.

Table 3.4-7. Estimated 2027-2036 Total[1] Program Renewal Impacts on Steelhead Habitat[5]

Community and Land Cover	Sediment Removal[2,3] (acres) – Temporary	Aquatic Herbicide Application[2] (acres) – Temporary	Vegetation Management (<6" dbh)[2] (acres) – Temporary	Tree Removal (>6" dbh) (acres) – Permanent	Mechanical Mowing (acres) – Temporary	Hand Weed Abatement (acres) – Temporary	Total (acres)

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided. As discussed under "Impact Assessment" above, although the biological resources subject to maintenance activities are often of lower quality in areas where recent maintenance has previously occurred, the discussion of the impacts that could result from Program Renewal activities is applied to biological resources in all impact areas, regardless of whether or not maintenance has recently occurred along a particular reach (i.e., the most conservative approach is assumed). Thus, the total impact areas for 2027-2036 are ten times the annual impact areas, regardless of whether impacts may occur within the same area multiple times.

[2] All impacts of sediment removal, vegetation management (<6" dbh), and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] The estimated impacts of sediment removal on habitat for CCC steelhead have been adjusted to account for the presence of sediment deposition reaches along the lower Guadalupe River.

[4] Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

[5] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

The primary impact to steelhead habitat resulting from sediment removal would be the removal of spawning gravel. Because 2027–2036 sediment removal activities would include impacts within some higher-elevation reaches where steelhead would be likely to spawn, such as in the Guadalupe River watershed, adverse effect of sediment removal on steelhead breeding habitat may occur because of the removal of gravel. Gravel removal would reduce the extent and availability of potential spawning habitat, and possibly rearing habitat, in the short term by removing existing spawning habitat and in the long term by reducing gravel supply within a creek. Due to the limited extent of available spawning gravel habitat for federally listed steelhead within the Program Renewal Area, this impact would be considered significant under CEQA.

Temporary impacts of sediment removal, aquatic herbicide application, vegetation management, and other maintenance activities within aquatic and vegetated wetland habitats used by steelhead in lower portions of watersheds (i.e., areas used for migration and rearing, but not for spawning) would also occur. Maintenance activities would reduce vegetative cover and available foraging resources for steelhead within these areas. Although the majority of steelhead habitat in these areas would be restored to existing conditions following the completion of the maintenance work, maintenance activities would result in the temporary loss of instream rearing and foraging habitat and instream complexity. Due to importance of instream rearing habitat and instream complexity for federally listed steelhead within the Program Renewal Area, this impact would be significant under CEQA.

If a work site is wetted and the area must be dry to perform the maintenance activity, Valley Water will relocate steelhead from the work area and install barriers to exclude fish from the area during in-water maintenance work. Before and during site dewatering, qualified biologists will capture fish and relocate them away from the work area to avoid direct mortality from maintenance activities.

Woody riparian vegetation that shades steelhead streams and would be altered by maintenance activities serves a number of important roles for steelhead, as discussed previously. Studies have found that primary production in seasonally warm, unshaded streams is often higher than primary production in shaded, cool streams (Casagrande 2010). Greater primary production can lead to greater instream food availability for foraging fish, thus increasing growth rates (Rossi et al. 2022, Casagrande 2010). However, per-project limits of no more than 20 percent overstory canopy removal in any reach are unlikely to cause substantial increases in stream temperatures. Rearing salmonids may migrate out of areas where vegetation management occurs to seek increased cover temporarily; however, such effects would be negligible.

Downed trees and large woody debris provide benefits to all life stages of CCC and SCCC steelhead by providing refugia, foraging habitat, and instream habitat complexity. A reduction in instream complexity resulting from large woody debris removal from downed tree management and other maintenance activities would reduce the amount of escape cover and refugia habitat for adult and juvenile CCC and SCCC steelhead. In contrast, benefits of downed tree management include removing large woody debris to facilitate fish passage or maintain the function of existing fish ladders, as well as improved instream habitat when large woody debris is retained. However, due to the sensitivity of these species, the net impacts due to the removal of large woody debris and associated instream complexity are expected to adversely affect CCC and SCCC steelhead, and be significant under CEQA.

Mitigation activities such as gravel augmentation (Mitigation Measure BIO-3) and installation of instream complexity (Mitigation Measure BIO-4) could also result in direct and indirect impacts to steelhead during installation; however, the net effect of these measures on these species would be beneficial.

The application of the herbicides and surfactants proposed for use in the Program Renewal (i.e., glyphosate, imazapyr, imazamox, triclopyr-choline, ethyl olate, and paraffinic oil) has the potential to result in direct impacts on steelhead survival, reproduction, and growth, as well as the indirect reduction of prey, as well as the temporary modification of in-stream vegetated wetlands and/or woody riparian habitat that shades steelhead streams. Due to the sensitivity of these species, impacts on individual steelhead and their habitat due to the application of herbicides and surfactants would be significant under CEQA. The Program Renewal Area contains designated critical habitat for both the CCC and SCCC steelhead (Figure 3.4-15). Stream maintenance activities would result in both negligible and adverse impacts on designated critical habitat, as described above for steelhead habitat in general. Specifically, Program Renewal activities could impact the physical and biological features (PBFs) of critical habitat involving freshwater spawning, rearing, and migration habitat for both populations, as well as estuarine habitats of the CCC steelhead. Impacts of the Program Renewal on designated critical habitat for CCC and SCCC steelhead due to the temporary or permanent loss of aquatic, riparian and/or wetland habitat supporting PBFs would be considered significant under CEQA in the absence of BMPs, VHP conditions, and VHP fees.

APPLICABLE BMPS AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on the CCC and SCCC steelhead and their habitats in the Program Renewal Area:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities in salmonid streams to ensure that those activities avoid and minimize times of year when salmonids are most likely to be present.
- **BMP GEN-2: Instream Herbicide Application** ensures that in-stream herbicide application is limited to the period from June 15 to October 15, or until significant rainfall is forecasted or observed, when salmonids are less likely to be present. In addition, herbicides will not be applied directly to water; and herbicide application will comply with the 2014 Salmonid Injunction.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-18: Salvage Native Aquatic Vertebrates from Dewatered Channels** requires implementation of a fish and native aquatic vertebrate relocation plan to ensure that fish and native aquatic vertebrates are not stranded during localized

dewatering. Streams that support steelhead will require a relocation effort and/or initial on-site monitoring by a qualified biologist, depending on seasonal conditions.

- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of salmonids.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-41: Dewatering in Tidal Work Areas** provides procedures for diverting water around work areas in tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be

managed to ensure that it does not cause water quality degradation in a live stream.

- **BMP SED-3: Restore Channel Features** states that low-flow channels within non-tidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.
- **BMP BANK-2: Concrete Use near Waterways** provides measures to ensure that fresh concrete is isolated until it no longer poses a threat to water quality.

If maintenance activities are located near spawning or rearing habitats, steelhead fry and juveniles that may be present in work areas when maintenance activities occur can be subject to capture and relocation as specified in BMP GEN-18. As discussed under "Impacts on Common and Special-Status Fish and Wildlife" above, relocated fish would be subject to harassment, pursuit, capture, and the related stresses associated with netting, electrofishing, temporary captivity, and release into the relocation site. They may also be subject to injury and mortality, albeit rarely, when best practices are followed. Valley Water fish relocation activities for the SMP from 2002–2013 resulted in a steelhead mortality rate of only <1 percent, and SMP relocations from 2014-2023 resulted in no observed steelhead injury or mortality (Valley Water 2002–2004, 2006–2009, 2010-2013, Valley Water unpublished data). In addition, although some potential would exist for changes in temperature or water chemistry or predator densities between capture and release sites to result in stress, injury, or mortality of steelhead as well, the relocation sites would be carefully selected by experienced Valley Water fisheries biologists based on criteria to minimize these effects. Thus, with Valley Water's careful approach, the benefits of steelhead relocation (i.e., the avoidance of loss of up to all the individuals present in the work area) would far outweigh any limited adverse effects, and impacts of steelhead relocations performed in support of the Program Renewal would be less than significant under CEQA.

Per BMP GEN-2, instream herbicide application will take place between June 15 and October 15 (or until significant rainfall is forecasted or observed), when salmonids are less likely to be present. Valley Water will also use only herbicide formulations approved for aquatic environments and adhering to state and federal regulations concerning herbicide use. The use of these pesticides and surfactants according to existing label directions and the California Department of Pesticide Regulation PRESCRIBE database, which provides information consistent with USEPA's Interim Measures Bulletins for Protection of Endangered Species for user-selected sites and pesticides, would minimize direct adverse effects on steelhead. With the implementation of these measures, herbicides would not be applied using methods that could result in direct or indirect impacts on these species.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions explicitly focus on protection of the CCC and SCCC steelhead

within the Program Renewal Area, as these species are not covered under the VHP. These species are not expected to be covered under the VHP in the future. However, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on the CCC and SCCC steelhead and their habitats by protecting water quality, preventing erosion, and minimizing habitat impacts. Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on aquatic habitats, and thereby on steelhead:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on state and federally listed species, including the CCC and SCCC steelhead.
- **Condition 3. Maintain Hydrologic Conditions and Protect Water** Quality includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats for CCC and SCCC steelhead in the Program Renewal Area, including specialty fees per acre of impacts to riparian forest and scrub and coastal and valley freshwater marsh habitats as well as per linear foot of impacts to streams; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. No Program Renewal impacts on steelhead are covered under the VHP, and steelhead are not anticipated to be added as VHP-covered species in the future. Thus, compliance with VHP conditions will not include measures specifically designed to avoid and minimize impacts on steelhead as a result of the Program Renewal. However, for VHP-covered activities, compliance with habitat plan conditions and payment of land cover fees will reduce impacts on steelhead and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts), and mitigate for impacts to their habitats (i.e., by paying land cover fees). VHP impact fees paid by Valley Water for VHP-covered impacts on riparian, wetland, and stream habitats would contribute to the VHP's conservation Program Renewal, which includes riparian and wetland habitat restoration to offset impacts of VHP-covered activities. Thus, implementation of Valley Water BMPs and compliance with applicable VHP conditions would reduce impacts on riparian and wetland habitats within the VHP permit area. In addition, VHP-covered activities will comply with requirements of Conditions 3, 4, and 5 to further protect water quality and avoid and minimize impacts to streams.

With the implementation of BMPs, adherence to VHP conditions, and payment of VHP land cover fees and specialty fees, adverse impacts of VHP-covered Program Renewal activities on individual steelhead as well as on wetland and riparian habitats that support these species would be less than significant under CEQA, and no mitigation measures are necessary. However, residual adverse impacts would remain significant due to the removal of spawning gravels and/or instream habitat complexity features important to listed steelhead habitat. These impacts would be significant under CEQA, in the absence of mitigation measures, due to the sensitivity of these species and the high value these habitat components provide. Mitigation Measures BIO-3 and BIO-4 below would reduce these impacts to less than significant levels by augmenting high-quality spawning gravel, augmenting instream habitat complexity, or implementing other projects that provide substantial habitat benefit for salmonids. These may include fish passage projects or projects that provide refugia for salmonids. These measures would be implemented when spawning gravel and/or instream habitat complexity features important to listed steelhead habitat is removed by Program Renewal Activities, and as part of the large-scale salmonid habitat restoration projects discussed in Section 10.6.6 of the SMP Manual. These are projects that maximize benefit to steelhead based on the specific needs of fish populations and which therefore may or may not include a direct replacement of habitat features. Because different regulatory agencies have different mandates, specific details of how these restoration projects would provide mitigation for Program Renewal activities would be coordinated with individual agencies, particularly NMFS.

Mitigation Measure BIO-3: Augmentation of Spawning Gravel

Valley Water will implement gravel augmentation as mitigation for Program Renewal impacts to spawning habitat for CCC steelhead, SCCC steelhead, and Pacific lamprey. If more than 100 square feet of sediment removal is proposed along streams supporting these species, a Valley Water fisheries biologist will assess the sediment removal site for spawning and rearing habitat quality prior to the initiation of work. The biologist will determine the extent of sediment that is proposed for removal and that is considered to be “high-quality” spawning gravel, based on the following criteria:

- Less than 25-30 percent fines less than 6.35 mm (Kondolf 2000, Kondolf and Wolman 1993)
- Less than 12-14 percent fines less than 0.85 mm (Kondolf 2000)
- D50 (median particle size) of 12.5 to 22.0 mm, based on D50 of rainbow trout and steelhead from 30 to 65 centimeters (cm) length (Kondolf and Wolman 1993), corresponding to a range of 275 to 640 cm of steelhead adults recovered in streams of the San Francisco estuary (Leidy et al. 2005)
- Minimum patch size greater than 1.1 m2 (Trush 1991)

The habitat needs to be accessible under typical flows for when the appropriate life stages are present. Suitable depths and velocities must be available during flows typical of spawning season. Factors related to accessibility include depth and velocity criteria, which for spawning, are:

- Depth: 10–150 cm (Moyle 2002)
- Velocity: 20–155 cm/s (Moyle 2002)

If more than 100 square feet of high-quality gravel will be removed along streams supporting steelhead, and Pacific lamprey, Valley Water will provide compensatory mitigation via the installation of suitable spawning gravel along the affected creek at a 1:1 (mitigation:impact) ratio on a square footage or acreage basis or through other fisheries habitat projects as approved by appropriate resource agencies. Locations where sediment removal is performed at fish ladders will not require gravel augmentation, as these areas do not provide spawning habitat.

Mitigation Measure BIO-4: Augmentation of Instream Complexity

Valley Water will provide mitigation for the loss of instream complexity via the in-kind installation of structures that provide such complexity. Prior to sediment removal, bank stabilization, or large woody debris management, the affected area will be surveyed by a Valley Water fisheries biologist to identify any features that provide high-quality instream habitat complexity for salmonids. The biologist will determine that such features are of "high quality" based on a combination of the presence of one or more of the following criteria:

- Large woody debris providing cover and refugia from high flow velocities
- Deep pools providing rearing habitat and refugia from high flow velocities
- Cobble/boulder features providing cover, refugia from high flow velocities, and velocities suitable for good invertebrate drift

If such high-quality features must be removed from streams supporting salmonids during Program Renewal activities, Valley Water will provide compensatory mitigation by the installation of instream complexity features on a 1:1 (impact:mitigation) basis, on the basis of either the number of complexity features or the area that is affected hydrologically by the features that are removed; the fisheries biologist will determine which of these two metrics is appropriate based on the values to fish provided by the impacted features. Thus, one instream complexity feature will be installed for every one that is removed, or an instream complexity feature hydraulically affecting roughly the same area of the feature(s) removed will be installed. Impacts to instream complexity features may also be mitigated through other projects that benefit salmonids, such as passage improvement projects, when approved of by appropriate resource agencies.

As examples, enhancing instream complexity may involve:

- enlarging an existing large woody debris feature;
- anchoring a large woody debris feature;
- geomorphically shaping an instream bar or bed feature for improved habitat;

- enhancing a pool feature threatened by sedimentation; or
- enhancing streambed conditions to increase the range of flow velocity and habitat conditions.

Priority for these mitigation activities will be given to maintenance sites where instream features cannot be retained during construction because of conflicting objectives. For example, if a channel pool configuration cannot be retained during a bank protection job and the area is devoid of other complex pool features, then this area will be evaluated for the addition of an instream complexity feature.

In addition to enhancing existing features, new instream features may be developed to achieve several habitat objectives, including increasing pool habitat in homogenized stream reaches, providing escape cover for rearing and spawning fish, deepening feeding areas in riffle habitat, creating a variety of stream flow velocities for cover, sorting gravel, and providing resting areas for upstream migration. Additionally, improving instream function can benefit other aquatic flora and fauna by improving the overall stream complexity for which these species depend on for survival. If effective, such new instream complexity features (particularly in highly modified, urban streams) can augment or replace existing structural features required for successful reproduction and rearing of native fish and amphibians in the freshwater environment.

Newly developed instream habitat improvements may use log structures, boulder structures, or a combination of both log and boulder structures to achieve more complex habitats. Possible configurations of boulders or logs include weirs, clusters, single and opposing wing deflectors, spider logs, and digger logs. The construction materials selected for each instream complexity feature will depend on the target objective and site conditions.

The fisheries biologist, retained by Valley Water, will prepare specifications for the mitigation, including size, type, and configuration of the feature. The mitigation will be implemented prior to or within 1 year following the impact. The fisheries biologist will then inspect the completed complexity feature to assure that it meets the criteria for “high quality” instream complexity listed above.

Activities Not Covered under the VHP

With the implementation of BMPs, impacts of the Program Renewal on individual steelhead would be less than significant under CEQA, and no mitigation measures are necessary. However, residual adverse impacts would remain significant due to the loss of riparian and wetland habitats that support these species, as well as to the removal of spawning gravels and/or instream habitat complexity features important to their habitat. These impacts would be significant under CEQA, in the absence of mitigation measures, due to the sensitivity of these species and the high value these habitat components provide.

If salmonid habitat is removed due to maintenance activities, Valley Water will implement Mitigation Measure BIO-5 below to reduce residual impacts due to the loss of salmonid habitats to a less than significant level by replacing lost habitat functions and values through restoration, preservation, or enhancement of riparian and wetland habitats. Mitigation Measures BIO-3 and BIO-4 above would reduce more specific impacts due to the loss of

spawning gravel and instream complexity within those habitats to less than significant levels. Mitigation Measure BIO-3 will ensure that that any high-quality spawning gravel that is removed during sediment removal activities is augmented, and Mitigation Measure BIO-4 will ensure that any high-quality instream habitat complexity features that are removed are augmented following the work. All of these measures (BIO-3, BIO-4, and BIO-5) would be implemented by Valley Water as part of the large-scale salmonid habitat restoration projects discussed in Section 10.6.6 of the SMP Manual. Because different regulatory agencies have different mandates, specific details of how these restoration projects would provide mitigation for Program Renewal activities would be coordinated with individual agencies, particularly NMFS.

Herbicide application, which is not covered by the VHP, could affect CCC and SCCC steelhead in the Program Renewal Area. However, such herbicide use would only be performed with approval by a qualified biologist. In addition, with the implementation of BMP GEN-2, compliance with state and federal regulations regarding herbicide use, and adherence to label directions, impacts of herbicide application on CCC and SCCC steelhead would be less than significant under CEQA, and no mitigation measures are necessary.

Mitigation Measure BIO-5: Salmonid Habitat Restoration Projects

Valley Water will construct large-scale salmonid habitat restoration projects, involving either passage improvement; habitat feature development, such as large woody debris, gravel, and instream complexity; or other methods to improve stream function for salmonid habitat. These projects would be implemented to reduce residual impacts of non-VHP-covered activities due to the loss of salmonid habitat features to a less than significant level by replacing lost habitat functions and values through restoration, preservation, or enhancement. The Coyote 10B and Stevens Creek Evelyn Avenue Fish Passage mitigation projects are among the potential projects to be implemented to restore salmonid habitat, as follows:

- Coyote 10B is an abandoned gravel pond that could be enhanced to provide seasonal wetland and riparian habitat. The Coyote 10B site is located upstream of the Hwy 101/State Route 85 interchange on the east side of Valley Water's Coyote Dam. In 2005, the pond was measured at an average depth of approximately 8-10 feet and a maximum depth of 13 feet. The Coyote 10B site has the potential to provide approximately 7 acres of seasonal wetland, riparian habitat, and high-water refugia for fish as Program Renewal mitigation.
- The Stevens Creek Evelyn Avenue Fish Passage Project (Evelyn Project) was initially constructed in 2015. Valley Water is developing new designs for chutes, pools, and roughened channels, as well as design improvements to the channel profile, cross-section geometry, and engineered streambed material, for a reconstructed Evelyn Project. The goal of the new design approach is to provide a longer-term sustainable flow solution that supports fish migration in a creek zone that is highly dynamic and subject to geomorphic change during large flow events. An operations and maintenance guidance document for this project will be

prepared as part of the final design and planning process.

Because different regulatory agencies have different mandates, specific details of how salmonid habitat restoration projects would provide mitigation for Program Renewal activities would be coordinated with individual agencies, particularly NMFS.

Valley Water will conduct monitoring to document that the mitigation is operational and successfully providing the functions and values needed to offset Program Renewal impacts to fish, as described in detail under "Mitigation Feasibility Assessment, Monitoring, Reporting, and Success Criteria" above and in Appendix F.

SUMMARY AND CONCLUSION

Program Renewal activities can result in significant impacts on CCC and SCCC steelhead and their habitat within portions of the Program Renewal Area where these species occur (Figure 3.4-15). Valley Water will implement applicable Program Renewal BMPs to avoid and minimize impacts on individual steelhead and their habitat. With the implementation of these measures, Program Renewal impacts (regardless of VHP coverage) on individual steelhead are less than significant under CEQA, and no mitigation measures are necessary. Residual significant impacts would remain due to the loss of riparian and wetland habitats that support these species, as well as to the removal of spawning gravels and/or instream habitat complexity features important to their habitat.

For VHP-covered activities, compliance with habitat plan conditions and payment of land cover fees will reduce impacts on steelhead and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts), and mitigate for impacts to their habitats (i.e., by paying land cover fees). In addition, VHP-covered activities will comply with requirements of Conditions 3, 4, and 5 to further protect water quality and avoid and minimize impacts to streams. With the payment of VHP fees, Program Renewal impacts on riparian and wetland habitats would be less than significant under CEQA. Mitigation Measures BIO-3 and BIO-4 would reduce impacts related to the removal of spawning gravel and instream habitat complexity to less than significant levels by augmenting any high-quality spawning gravel that is removed during sediment removal activities and augmenting instream habitat complexity where high-quality features are removed. Thus, with payment of VHP fees and implementation of Mitigation Measures BIO-2 and BIO-3, impacts of VHP-covered impacts on steelhead are less than significant under CEQA.

For non-VHP-covered activities, Mitigation Measure BIO-5 would be implemented to reduce residual impacts due to the loss of riparian and wetland habitats to a less than significant level by replacing lost habitat functions and values through restoration, preservation, or enhancement. Mitigation Measures BIO-3 and BIO-4 would reduce impacts due to the loss of spawning gravel and instream complexity to less than significant levels by augmenting any high-quality spawning gravel that is removed during sediment removal activities and augmenting instream habitat complexity where high-quality features are removed.

Impact BIO-1E: Impacts on the Pacific Lamprey (Less than Significant with Mitigation)

IMPACT ASSESSMENT

The Pacific lamprey is a California species of special concern that occurs in a number of Valley Water-maintained creeks. The distribution of this species in the Program Renewal Area is not as well-known as that of steelhead, discussed above, but it is currently known to occur in the Guadalupe River, San Francisquito Creek, Coyote Creek, Upper Penitencia Creek, Lower Silver Creek, Guadalupe Creek, Alamitos Creek, Los Gatos Creek, Stevens Creek, and Uvas Creek (Table 3.4-4).

Impacts of the Program Renewal on individual Pacific lamprey are similar to those described for CCC and SCCC steelhead under Impact BIO-1D and are as described under "Impacts on Common and Special-Status Fish and Wildlife", above. In addition, electrofishing for fish relocation, stranding, herbicide and surfactant use, and increased turbidity may result in the direct injury or mortality of individual lamprey, particularly the larval stage of this species that burrows into fine sediment and filter feeds for several years. Due to the potential for direct injury or mortality, Program Renewal impacts that result in the loss of individuals of this species such that a substantial (i.e., population-level) impact occurs would be considered significant under CEQA.

The total estimated acreages of Program Renewal impacts along streams where Pacific lamprey potentially occur are provided in Table 3.4-8. Of these, impacts to vegetated wetlands (101.8 acres) and aquatic (riverine) habitat (20.6 acres) would occur directly within Pacific lamprey habitat, impacts to herbaceous streambank vegetation (258.5 acres) and woody riparian vegetation (20.8 acres) would occur on stream banks within or directly upslope of steelhead habitat, and impacts to other (non-developed upland) habitat (246.6 acres) would occur outside of the stream channel. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

Within the lower Guadalupe River in the Santa Clara Basin, 1,660 linear feet of the projected sediment removal work is located within specific sediment deposition reaches that are designed to capture sediment when flows exceed capacity of the main channel. These reaches run outside of, but parallel to, the main channel, and allow sediment removal activities to occur without impacting Pacific lamprey that may be present within the Guadalupe River. The estimated impacts of sediment removal on habitat for Pacific lamprey provided in Table 3.4-8 have been adjusted to account for these sediment deposition reaches.

Table 3.4-8. Estimated 2027-2036 Total[1] Program Renewal Impacts on Pacific Lamprey Habitat[5]

Community and Land Cover	Sediment Removal[2,3] (acres) – Temporary	Aquatic Herbicide Application[2] (acres) – Temporary	Vegetation Management (<6" dbh)[2] (acres) – Temporary	Tree Removal (>6" dbh) (acres) – Permanent	Mechanical Mowing (acres) – Temporary	Hand Weed Abatement (acres) – Temporary	Total (acres)
Pacific Lamprey							
Vegetated Wetlands (Coastal and Valley Freshwater Marsh, Tidal Salt Marsh, and Tidal Brackish Marsh)	5.2	79.9	16.8	0.0	0.0	0.0	101.8
Aquatic Habitat (Riverine, Tidal, and Intertidal)	20.6	0.0	0.0	0.0	0.0	0.0	20.6
Herbaceous Streambank (California Annual Grassland)	0.0	44.6	0.9	0.0	159.0	54.0	258.5
Woody Riparian (Riparian Forest and Scrub)	0.0	6.8	13.1	0.9	0.0	0.0	20.8
Other (Non-Developed Uplands) [4]	0.0	0.0	1.2	0.2	193.3	51.9	246.6
Total	**25.8**	**131.2**	**32.0**	**1.2**	**352.3**	**105.9**	**648.4**

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided. As discussed under "Impact Assessment" above, although the biological resources subject to maintenance activities are often of lower quality in areas where recent maintenance has previously occurred, the discussion of the impacts that could result from Program Renewal activities is applied to biological resources in all impact areas, regardless of whether or not maintenance has recently occurred along a particular reach (i.e., the most conservative approach is assumed). Thus, the total impact areas for 2027-2036 are ten times the annual impact areas, regardless of whether impacts may occur within the same area multiple times.

[2] All impacts of sediment removal, vegetation management (<6" dbh), and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] The estimated impacts of sediment removal on habitat for Pacific lamprey have been adjusted to account for the presence of sediment deposition reaches along the lower Guadalupe River.

[4] Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

[5] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

As described for CCC and SCCC steelhead under Impact BIO-1D above, the primary impact to Pacific lamprey and their habitat would result from sediment removal. Similar to CCC and SCCC steelhead, Pacific lamprey require spawning gravel for spawning and finer substrates for larval rearing to complete their life cycle. Because 2027–2036 sediment removal activities include some higher-elevation reaches where Pacific lamprey would be likely to spawn, adverse effects of sediment removal on Pacific lamprey spawning and rearing habitat may occur because of sediment removal. Gravel removal would reduce the extent and availability of potential spawning habitat, and possibly rearing habitat, in the short term by removing existing spawning habitat and in the long term by reducing gravel supply within a creek. Due to the importance of spawning substrates within the Program Renewal Area, this impact would be considered significant under CEQA.

As described under "Impacts on Common and Special-Status Fish and Wildlife" and Impact BIO-1D above, maintenance activities may result in temporary and permanent adverse impacts to habitat used by Pacific lamprey through dewatering, increased turbidity/suspended sediment, changes in habitat structure, vegetation management, and other impact pathways. Although the majority of Pacific lamprey habitat in these areas would restore to existing conditions following the completion of the maintenance work, maintenance activities would result in the temporary or permanent loss of instream rearing and foraging habitat and instream complexity and are considered significant under CEQA. In contrast, downed tree management activities would benefit fish by contributing to instream complexity and/or ensuring that existing habitat is maintained when large woody debris is retained or modified.

Woody riparian vegetation that shades Program Renewal Area streams and would be altered by aquatic herbicide application, vegetation management, downed tree management, and other maintenance activities serves a number of important roles for Pacific lamprey, as discussed previously for CCC and SCCC steelhead. Additionally, instream woody debris provides important sources of cover for spawning and holding adult lamprey. Similar to the impacts to steelhead, per-project limits of no more than 20 percent overstory canopy removal in any reach are unlikely to cause substantial increases in stream temperatures; however, a reduction in instream wood would reduce the amount of instream cover for Pacific lamprey. Some benefits of downed tree management activities include removing large woody debris to facilitate fish passage or maintain the function of existing fish ladders and benefits to instream habitat when large woody debris is retained. However, the loss of instream habitat complexity if large woody debris is removed would have adverse effects on Pacific lamprey. As such, the net impacts of the Program Renewal on individuals of this species are expected to be adverse and significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on the Pacific lamprey:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities in salmonid streams to avoid and minimize times of year when adult special-status fish, including Pacific lamprey, are less likely to be present.
- **BMP GEN-2: Instream Herbicide Application** ensures that in-stream herbicide application is limited to the period from June 15 to October 15, or until significant

rainfall is forecasted or observed, when adult special-status fish, including Pacific lamprey, are less likely to be present, and provides additional measures to ensure that effects of instream herbicide application on special-status fish are minimized.

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-18: Salvage Native Aquatic Vertebrates from Dewatered Channels** requires implementation of a fish and native aquatic vertebrate relocation plan to ensure that fish and native aquatic vertebrates are not stranded during localized dewatering. Streams that support a Pacific lamprey will require a relocation effort and/or initial on-site monitoring by a qualified biologist, depending on seasonal conditions.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of Pacific lamprey.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.

- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMPs GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-41: Dewatering in Tidal Work Areas** provides procedures for diverting water around work areas in tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within non-tidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.
- **BMP BANK-2: Concrete Use near Waterways** provides measures to ensure that fresh concrete is isolated until it no longer poses a threat to water quality.

If maintenance activities are located near spawning or rearing habitats, Pacific lamprey that may be present in work areas when maintenance activities occur can be subject to capture and relocation as specified in BMP GEN-18. As discussed under "Impacts on Common and Special-Status Fish and Wildlife" above, relocated fish would be subject to harassment, pursuit, capture, and the related stresses associated with netting, electrofishing, temporary captivity, and release into the relocation site. They may also be subject to injury and mortality, albeit rarely, when best practices are followed. As described for BIO-1D, Valley Water fish relocation activities for the SMP from 2002–2013 and from 2014-2023 resulted in little to no injury or mortality of steelhead, and similar injury and mortality rates would be expected to Pacific lamprey (Valley Water 2002–2004, 2006–2009, 2010-2013, Valley Water unpublished data). In addition, although some potential would exist for changes in temperature or water chemistry or predator densities between capture and release sites to result in stress, injury, or mortality of Pacific lamprey as well, the relocation sites would be carefully selected by experienced Valley Water fisheries biologists based on criteria to minimize these effects. Thus, with Valley Water's careful approach, the benefits of Pacific

lamprey relocation (i.e., the avoidance of loss of up to all the individuals present in the work area) would far outweigh any limited adverse effects, and impacts of Pacific lamprey relocations performed in support of the Program Renewal would be less than significant under CEQA.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on the protection of the Pacific lamprey within the Program Renewal Area, as this species is not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). This species is not expected to be covered under the VHP in the future. However, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on the Pacific lamprey and its habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on aquatic habitats:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats for the Pacific lamprey in the Program Renewal Area, including specialty fees per acre of impacts to riparian forest and scrub and coastal and valley freshwater marsh habitats as well as per linear foot of impacts to streams; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. No Program Renewal impacts on Pacific lamprey are covered under the VHP, and this species is not anticipated to be added as VHP-covered species in the future. Thus, compliance with VHP conditions will not include measures specifically designed to avoid and minimize impacts on Pacific lamprey as a result of the Program Renewal. However, for VHP-covered activities, compliance with habitat plan conditions and payment of land cover fees will reduce impacts on Pacific lamprey and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts), and mitigate for impacts to their habitats (i.e., by paying land cover fees). VHP impact fees paid by Valley Water for VHP-covered impacts on riparian, wetland, and stream habitats would contribute to the VHP's conservation Program Renewal, which includes riparian and wetland habitat restoration to offset impacts of VHP-covered activities. Thus, implementation of Valley Water BMPs and compliance with applicable VHP conditions

would reduce impacts on riparian and wetland habitats within the VHP permit area to less than significant levels under CEQA. In addition, VHP-covered activities will comply with requirements of Conditions 3, 4, and 5 to further protect water quality and avoid and minimize impacts to streams.

With the implementation of BMPs, adherence to VHP conditions, and payment of VHP land cover fees and specialty fees, adverse impacts of the Program Renewal on individual Pacific lamprey as well as on wetland and riparian habitats that support this species would be less than significant under CEQA, and no mitigation measures are necessary. However, residual adverse impacts would remain significant due to the removal of spawning gravels and/or instream habitat complexity features important to this species' habitat. These impacts would be significant under CEQA, in the absence of mitigation measures, due to the sensitivity of this species and the high value these habitat components provide. Mitigation Measures BIO-3 and BIO-4 above would reduce these impacts to less than significant levels by augmenting high-quality spawning gravel that is removed during sediment removal activities and augmenting instream habitat complexity where high-quality features are removed. These measures would be implemented for impacts in the streams described in Tables 9-1 and 9-2 and as part of the large-scale salmonid habitat restoration projects discussed in Section 10.6.6 of the SMP Manual. Mitigation measures described for salmonids in the SMP Manual will be adequate compensatory mitigation for potential residual impacts to Pacific lamprey. Because different regulatory agencies have different mandates, specific details of how these restoration projects would provide mitigation for Program Renewal activities would be coordinated with individual agencies, particularly NMFS.

Activities Not Covered under the VHP

With the implementation of BMPs, impacts of the Program Renewal on individual Pacific lamprey would be less than significant under CEQA, and no mitigation measures are necessary. However, residual adverse impacts would remain significant due to the loss of riparian and wetland habitats that support this species, as well as to the removal of spawning gravels and/or instream habitat complexity features important to their habitat. These impacts would be significant under CEQA, in the absence of mitigation measures, due to the sensitivity of this species and the high value these habitat components provide.

If habitat for salmonids (which also provides habitat for Pacific lamprey) is removed due to maintenance activities, Valley Water will implement Mitigation Measure BIO-5 above to reduce residual impacts due to the loss of salmonid/lamprey habitats to a less than significant level by replacing lost habitat functions and values through restoration, preservation, or enhancement of riparian and wetland habitats. Mitigation Measures BIO-3 and BIO-4 above would reduce more specific impacts due to the loss of spawning gravel and instream complexity within those habitats to less than significant levels. Mitigation Measure BIO-3 will ensure that any high-quality spawning gravel that is removed during sediment removal activities is augmented, and Mitigation Measure BIO-4 will ensure that any high-quality instream habitat complexity features that are removed are augmented following the work. All of these measures (BIO-3, BIO-4, and BIO-5) would be implemented by Valley Water for impacts in streams in Tables 9-1 and 9-2 and as part of the large-scale salmonid habitat restoration projects discussed in Section 10.6.6 of the SMP Manual. Mitigation measures described for salmonids in the SMP Manual will be adequate compensatory mitigation for potential residual impacts to Pacific lamprey. Because different regulatory agencies have different mandates, specific details of how these restoration projects would

provide mitigation for Program Renewal activities would be coordinated with individual agencies, particularly NMFS.

Herbicide application, which is not covered by the VHP, could affect Pacific lamprey in the Program Renewal Area. However, as discussed for CCC and SCCC steelhead above, Valley Water will implement BMPs, including BMP GEN-2; use only herbicide formulations approved for aquatic environments; and adhere to state and federal regulations concerning herbicide use to minimize the effects of herbicides on aquatic species and their habitats. With the implementation of these measures, herbicides would not be applied using methods that could result in direct or indirect impacts on Pacific lamprey. Thus, with the implementation of BMPs, impacts of herbicide application on Pacific lamprey would be less than significant under CEQA, and no mitigation measures are necessary.

SUMMARY AND CONCLUSION

Program Renewal activities can result in significant impacts on Pacific lamprey and their habitat within portions of the Program Renewal Area where these species occur. Valley Water will implement applicable Program Renewal BMPs to avoid and minimize impacts on individual Pacific lamprey and their habitat. With the implementation of these measures, Program Renewal impacts (regardless of VHP coverage) on individual Pacific lamprey are less than significant under CEQA, and no mitigation measures are necessary. Residual significant impacts would remain due to the loss of riparian and wetland habitats that support this species, as well as to the removal of spawning gravels and/or instream habitat complexity features important to their habitat.

For VHP-covered activities, compliance with habitat plan conditions and payment of land cover fees will reduce impacts on Pacific lamprey and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts), and mitigate for impacts to their habitats (i.e., by paying land cover fees). In addition, VHP-covered activities will comply with requirements of Conditions 3, 4, and 5 to further protect water quality and avoid and minimize impacts to streams. With the payment of VHP fees, Program Renewal impacts on riparian and wetland habitats would be less than significant under CEQA. Mitigation Measures BIO-3 and BIO-4 would reduce impacts related to the removal of spawning gravel and instream habitat complexity to less than significant levels by augmenting any high-quality spawning gravel that is removed during sediment removal activities and augmenting instream habitat complexity where high-quality features are removed. Thus, with payment of VHP fees and implementation of Mitigation Measures BIO-3 and BIO-4, impacts of VHP-covered impacts on Pacific lamprey are less than significant under CEQA.

For non-VHP-covered activities, Mitigation Measure BIO-5 would be implemented to reduce residual impacts due to the loss of riparian and wetland habitats to a less than significant level by replacing lost habitat functions and values through restoration, preservation, or enhancement. Mitigation Measures BIO-3 and BIO-4 would reduce impacts due to the loss of spawning gravel and instream complexity to less than significant levels by augmenting any high-quality spawning gravel that is removed during sediment removal activities and augmenting instream habitat complexity where high-quality features are removed. Thus, with implementation of Mitigation Measures BIO-3, BIO-4, and BIO-5, impacts of non-VHP-covered impacts on Pacific lamprey are less than significant under CEQA.

Impact BIO-1F: Impacts on the Riffle Sculpin (Less than Significant)

IMPACT ASSESSMENT

The riffle sculpin is a California species of special concern that occurs in a number of Valley Water maintained creeks. It is currently known to occur in the Program Renewal Area in the Guadalupe and Pajaro River and San Francisquito, Upper Penitencia, Lower Silver, Guadalupe, Los Gatos, Alamitos, and Uvas Creeks (Table 3.4-4).

Impacts of the Program Renewal on individual riffle sculpin are similar to those described for CCC and SCCC steelhead under Impact BIO-1D, and as described under "Impacts on Common and Special-Status Fish and Wildlife" above. However, riffle sculpin only occur in the headwaters of a few watersheds in the Program Renewal Area, and the likelihood of maintenance activities overlapping riffle sculpin habitat is low. Therefore, impacts of the Program Renewal on individuals of this species are expected to be extremely limited, and would be less than significant under CEQA.

The total estimated acreages of Program Renewal impacts along watersheds where riffle sculpin potentially occur are provided in Table 3.4-9. Of these, impacts to vegetated wetlands (48.7 acres) and aquatic (riverine) habitat (8.9 acres) would occur directly within riffle sculpin habitat, impacts to herbaceous streambank vegetation (117.9 acres) and woody riparian vegetation (10.0 acres) would occur on stream banks within or directly upslope of riffle sculpin habitat, and impacts to other (non-developed upland) habitat (110.4 acres) would occur outside of the stream channel. However, as described above, riffle sculpin are generally confined to the upper headwaters of a few Program Renewal Area streams, and the majority of the total estimated acreages of Program Renewal impacts are outside of areas where riffle sculpin occur. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

Table 3.4-9. Estimated 2027-2036 Total[1] Program Renewal Impacts on Riffle Sculpin Habitat[4]

Community and Land Cover	Sediment Removal[2] (acres) – Temporary	Aquatic Herbicide Application[2] (acres) – Temporary	Vegetation Management (<6" dbh)[2] (acres) – Temporary	Tree Removal (>6" dbh) (acres) – Permanent	Mechanical Mowing (acres) – Temporary	Hand Weed Abatement (acres) – Temporary	Total (acres)
Riffle Sculpin							
Vegetated Wetlands (Coastal and Valley Freshwater Marsh)	2.2	38.4	8.1	0.0	0.0	0.0	48.7
Aquatic Habitat (Riverine)	8.9	0.0	0.0	0.0	0.0	0.0	8.9
Herbaceous Streambank (California Annual Grassland)	0.0	21.4	0.4	0.0	68.4	27.6	117.9
Woody Riparian (Riparian Forest and Scrub)	0.0	3.3	6.3	0.4	0.0	0.0	10.0
Other (Non-Developed Uplands)[3]	0.0	0.0	0.6	0.1	83.2	26.6	110.4
Total	**11.1**	**63.1**	**15.4**	**0.6**	**151.6**	**54.2**	**295.8**

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided. As discussed under "Impact Assessment" above, although the biological resources subject to maintenance activities are often of lower quality in areas where recent maintenance has previously occurred, the discussion of the impacts that could result from Program Renewal activities is applied to biological resources in all impact areas, regardless of whether or not maintenance has recently occurred along a particular reach (i.e., the most conservative approach is assumed). Thus, the total impact areas for 2027-2036 are ten times the annual impact areas, regardless of whether impacts may occur within the same area multiple times.

[2] All impacts of sediment removal, vegetation management (<6" dbh), and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

[4] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities, including sediment removal, herbicide application, and vegetation management, may result in temporary and permanent adverse effects on habitat used by riffle sculpin through dewatering, increased turbidity, changes in habitat structure, and other impact pathways. Although the majority of riffle sculpin habitat in these areas would restore to existing conditions following the completion of the maintenance work, maintenance activities would result in the temporary or permanent loss of instream rearing and foraging habitat and instream complexity. Permanent impacts on this species' habitats are expected to be very limited. Because riffle sculpin only occur in a few Program Renewal Area streams within the upper watersheds, and the likelihood of maintenance activities overlapping riffle sculpin habitat is low, impacts of the Program Renewal on habitat for this species are expected to be extremely limited, and would be less than significant under CEQA. In addition, downed tree management activities would benefit fish by contributing to instream complexity and/or ensuring that existing habitat is maintained when large woody debris is retained or modified.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on the riffle sculpin:

- **BMP GEN-2: Instream Herbicide Application** ensures that in-stream herbicide application is limited to the period from June 15 to October 15, or until significant rainfall is forecasted or observed, when special-status fish, including riffle sculpin, are less likely to be present, and provides additional measures to ensure that effects of instream herbicide application on special-status fish are minimized
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-18: Salvage Native Aquatic Vertebrates from Dewatered Channels** requires implementation of a fish and native aquatic vertebrate relocation plan to ensure that fish and native aquatic vertebrates are not stranded during localized dewatering.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of riffle sculpin.

- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within non-tidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of the riffle sculpin within the Program Renewal Area, as this species is not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). This species is also not expected to be covered under the VHP in the future. However, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on the riffle sculpin and its habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on aquatic habitats:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats for the riffle sculpin in the Program Renewal Area, including specialty fees per acre of impacts to riparian forest and scrub and coastal and valley freshwater marsh habitats as well as per linear foot of impacts to streams. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

Due to the limited distribution of riffle sculpin in the Program Renewal Area, the likelihood that maintenance activities will affect this species is relatively low. As a result, VHP-covered Program Renewal impacts on this species would be less than significant under CEQA. VHP-Covered Program Renewal activities may also result in temporary or permanent impacts on suitable habitat for riffle sculpin in the Program Renewal Area. However, due to the limited distribution of this species in the Program Renewal Area, such impacts would be very limited, and also less than significant under CEQA. The implementation of Program Renewal BMPs would further reduce VHP-covered Program Renewal impacts on individual riffle sculpin and their habitat. No mitigation measures are necessary.

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. No Program Renewal impacts on riffle sculpin are covered under the VHP, and this species is not anticipated to be added as VHP-covered species in the future. Thus, compliance with VHP conditions will not include measures specifically designed to avoid and minimize impacts on riffle sculpin as a result of the Program Renewal. However, for VHP-covered activities, compliance with habitat plan conditions and payment of land cover fees will reduce impacts on riffle sculpin and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts), and mitigate for impacts to

their habitats (i.e., by paying land cover fees). VHP impact fees paid by Valley Water for VHP-covered impacts on riparian, wetland, and stream habitats would contribute to the VHP's conservation Program Renewal, which includes riparian and wetland habitat restoration to offset impacts of VHP-covered activities. Thus, implementation of Valley Water BMPs and compliance with applicable VHP conditions would further reduce impacts on riparian and wetland habitats within the VHP permit area. No mitigation measures are necessary.

Activities Not Covered under the VHP

Due to the limited distribution of riffle sculpin in the Program Renewal Area, the likelihood that maintenance activities will affect this species is relatively low. As a result, non-VHP-covered Program Renewal impacts on this species would be less than significant under CEQA. Non-VHP-Covered Program Renewal activities may also result in temporary or permanent impacts on suitable habitat for riffle sculpin in the Program Renewal Area. However, due to the limited distribution of this species in the Program Renewal Area, such impacts would be very limited, and also less than significant under CEQA. The implementation of Program Renewal BMPs would further reduce non-VHP-covered Program Renewal impacts on individual riffle sculpin and their habitat. No mitigation measures are necessary.

Herbicide application, which is not covered by the VHP, could affect riffle sculpin in the Program Renewal Area. However, as discussed for CCC and SCCC steelhead above, Valley Water will implement BMPs, including BMP GEN-2, to minimize the effects of herbicides on aquatic species and their habitats. With the implementation of these measures, herbicides would not be applied using methods that could result in direct or indirect impacts on riffle sculpin. Thus, with the implementation of BMPs, impacts of herbicide application on Pacific lamprey would be effectively minimized, and these impacts are less than significant under CEQA. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

Riffle sculpin only occur in a few watersheds, so the likelihood of maintenance activities overlapping riffle sculpin habitat is low. Thus, Program Renewal impacts to riffle sculpin would be less than significant under CEQA, regardless of VHP coverage. Implementation of BMPs and compliance with VHP conditions would effectively minimize Program Renewal impacts on individual riffle sculpin and their habitats, and no mitigation measures are necessary. A mitigation measure that would further reduce impacts on this species and its habitat include Mitigation Measure BIO-5.

Impact BIO-1G: Impacts on Native, Special-Status Minnows (Hitch and Roaches) (Less than Significant)

The Sacramento hitch, Monterey hitch, and southern coastal roach are discussed together because they are all California species of special concern, their abundance in the Program Renewal Area is similar, BMPs to protect these species are similar, and no mitigation is required to reduce impacts of the Program Renewal on these species to less-than-significant levels under CEQA.

IMPACT ASSESSMENT

The Sacramento hitch, Monterey hitch, and southern coastal roach are abundant in several streams throughout the Program Renewal Area, as follows:

- Sacramento hitch occur in Coyote Creek, Coyote Reservoir, the Guadalupe River, Los Gatos Creek, Saratoga Creek, Anderson Reservoir, and San Francisquito Creek.
- Monterey hitch occur in the Pajaro River, Uvas Creek, Llagas Creek, and Pacheco Creek.
- Southern coastal roach occur in Coyote Creek, Upper Penitencia Creek, Uvas Creek, Llagas Creek, North Fork Pacheco Creek, and Arroyo Dos Picachos.

Maintenance activities could occur along these streams in the Program Renewal Area.

Impacts of the Program Renewal on individual Sacramento hitch, Monterey hitch, and southern coastal roach are similar to those described for CCC and SCCC steelhead under Impact BIO-1D, and as described under "Impacts on Common and Special-Status Fish and Wildlife", above. However, given the high abundance of these minnow species throughout the Program Renewal Area, impacts of maintenance activities on individuals and their habitats would not result in substantial impacts on their populations, and this impact would be less than significant under CEQA.

The total estimated acreages of Program Renewal impacts along streams where Sacramento hitch, Monterey hitch, and southern coastal roach potentially occur are provided in Table 3.4-10. Of these, impacts to vegetated wetlands (96.3 acres for Sacramento hitch, 24.9 acres for Monterey hitch, and 64.0 acres for southern coastal roach) and aquatic (riverine) habitat (13.2 acres for Sacramento hitch, 5.9 acres for Monterey hitch, and 10.4 acres for southern coastal roach) would occur directly within habitat for these species, impacts to herbaceous streambank vegetation (224.5 acres for Sacramento hitch, 55.2 acres for Monterey hitch, and 179.4 acres for southern coastal roach) and woody riparian vegetation (20.0 acres for Sacramento hitch, 5.0 acres for Monterey hitch, and 13.2 acres for southern coastal roach) would occur on stream banks within or directly upslope of suitable habitat, and impacts to other (non-developed upland) habitat (210.2 acres for Sacramento hitch, 52.0 acres for Monterey roach, and 175.4 acres for southern coastal roach) would occur outside of the stream channel. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided. As discussed under "Impact Assessment" above, although the biological resources subject to maintenance activities are often of lower quality in areas where recent maintenance has previously occurred, the discussion of the impacts that could result from Program Renewal activities is applied to biological resources in all impact areas, regardless of whether or not maintenance has recently occurred along a particular reach (i.e., the most conservative approach is assumed). Thus, the total impact areas for 2027-2036 are ten times the annual impact areas, regardless of whether impacts may occur within the same area multiple times.

[2] All impacts of sediment removal, vegetation management (<6" dbh), and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

[4] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in temporary and permanent adverse effects to habitat used by native, special-status minnows through dewatering, increased turbidity, changes in habitat structure, and other impact pathways. Although the majority of habitat in these areas would restore to existing conditions following the completion of the maintenance work, maintenance activities would result in the temporary or permanent loss of instream rearing and foraging habitat and instream complexity. Permanent impacts to this species' habitats are expected to be very limited. Because Sacramento hitch, Monterey hitch, and southern coastal roach are abundant along streams where they occur in the Program Renewal Area and tolerate a wide range of instream habitat conditions, impacts of the Program Renewal on habitat for this species would not result in substantial effects on their populations, and would be less than significant under CEQA. In addition, downed tree management activities would benefit fish by contributing to instream complexity and/or ensuring that existing habitat is maintained when large woody debris is retained or modified.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on the riffle sculpin:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities to avoid and minimize times of year when special-status fish, including native, special-status minnows, are most likely to be present.
- **BMP GEN-2: Instream Herbicide Application** ensures that in-stream herbicide application is limited to the period from June 15 to October 15, or until significant rainfall is forecasted or observed, when native, special-status minnows are less likely to be present.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-18: Salvage Native Aquatic Vertebrates from Dewatered Channels** requires implementation of a fish and native aquatic vertebrate relocation plan to ensure that fish and native aquatic vertebrates are not stranded during localized dewatering.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and

habitat requirements of Sacramento hitch, Monterey hitch, and southern coastal roach.

- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within non-tidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.

- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of native, special-status minnows within the Program Renewal Area, as these species are not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). These species are also not expected to be covered under the VHP in the future. However, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on special-status minnows and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on aquatic habitats:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats for native special-status minnows in the Program Renewal Area, including specialty fees per acre of impacts to riparian forest and scrub and coastal and valley freshwater marsh habitats as well as per linear foot of impacts to streams. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats. VHP impact fees paid by Valley Water for VHP-covered impacts on riparian and wetland habitats would contribute to the VHP's conservation Program Renewal, which includes riparian and wetland habitat restoration to offset impacts of VHP-covered activities.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

Impacts of VHP-covered Program Renewal activities on the Sacramento hitch, Monterey hitch, and southern coastal roach and their habitat are considered less than significant under CEQA due to the abundance of these species throughout the Program Renewal Area. With the implementation of Program Renewal BMPs, potential Program Renewal impacts on these species and their habitats are effectively minimized. No mitigation measures are necessary.

VHP-covered Program Renewal activities may result in temporary or permanent impacts on suitable habitat for Sacramento hitch, Monterey hitch, and southern coastal roach in the Program Renewal Area. The majority of these impacts are also expected to be temporary, as disturbed areas will typically restore to their existing conditions following maintenance activities. However, some permanent impacts will occur where activities such as bank stabilization result in modifications to natural areas. Due to the abundance of these species

in the Program Renewal Area, such impacts would not result in substantial effects on their populations and would be less than significant under CEQA. No mitigation measures are necessary.

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. No Program Renewal impacts on Sacramento hitch, Monterey hitch, or southern coastal roach are covered under the VHP, and this species is not anticipated to be added as VHP-covered species in the future. Thus, compliance with VHP conditions will not include measures specifically designed to avoid and minimize impacts on these species as a result of the Program Renewal. However, for VHP-covered activities, compliance with habitat plan conditions and payment of land cover fees will reduce impacts on riffle sculpin and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts), and mitigate for impacts to their habitats (i.e., by paying land cover fees). VHP impact fees paid by Valley Water for VHP-covered impacts on riparian, wetland, and stream habitats would contribute to the VHP's conservation Program Renewal, which includes riparian and wetland habitat restoration to offset impacts of VHP-covered activities. Thus, implementation of Valley Water BMPs and compliance with applicable VHP conditions would further reduce impacts on riparian and wetland habitats within the VHP permit area. No mitigation measures are necessary.

Activities Not Covered under the VHP

Impacts of non-VHP-covered Program Renewal activities on the Sacramento hitch, Monterey hitch, and southern coastal roach and their habitat are considered less than significant under CEQA due to the abundance of these species throughout the Program Renewal Area. With the implementation of Program Renewal BMPs, potential Program Renewal impacts on these species and their habitats are effectively minimized. No mitigation measures are necessary.

Non-VHP-covered Program Renewal activities may result in temporary or permanent impacts on suitable habitat for Sacramento hitch, Monterey hitch, and southern coastal roach in the Program Renewal Area. The majority of these impacts are also expected to be temporary, as disturbed areas will typically restore to their existing conditions following maintenance activities. However, some permanent impacts will occur where activities such as bank stabilization result in modifications to natural areas. Due to the abundance of these species in the Program Renewal Area, such impacts would not result in substantial effects on their populations and would be less than significant under CEQA. No mitigation measures are necessary.

Herbicide application, which is not covered by the VHP, could affect native special-status minnows in the Program Renewal Area. However, as discussed for CCC and SCCC steelhead above, Valley Water will implement BMPs, including BMP GEN-2, to minimize the effects of herbicides on aquatic species and their habitats. With the implementation of these measures, herbicides would not be applied using methods that could result in direct or indirect impacts on native special-status minnows. Thus, with the implementation of BMPs, impacts of herbicide application on these species would be effectively minimized, and no mitigation measures are necessary.

SUMMARY AND CONCLUSION

Due to the abundance of Sacramento hitch, Monterey hitch, and southern coastal roach in the Program Renewal Area, relative to the lower magnitude of impacts, impacts on these species would be less than significant under CEQA, and no mitigation measures are necessary. Implementation of BMPs and compliance with VHP conditions would further avoid and minimize adverse impacts on native, special-status minnows and their habitats. A mitigation measure that would further reduce impacts on these species and their habitat include Mitigation Measure BIO-5. Where Mitigation Measure BIO-4 (Augmentation of Instream Complexity) is performed along reaches supporting these species, it would also provide a benefit.

Impact BIO-1H: Impacts on Estuarine, Special-Status Fish (Longfin Smelt and Sturgeons) (Less than Significant)

The longfin smelt, white sturgeon, and green sturgeon are discussed together because they occur in similar locations in the Program Renewal Area (i.e., estuarine habitats), BMPs to protect these species are similar, and no mitigation is required to reduce impacts of the Program Renewal on these species to less-than-significant levels under CEQA.

IMPACT ASSESSMENT

San Francisco Bay-Delta longfin smelt (state listed as threatened and federally listed as endangered) and white sturgeon (a candidate for listing under CESA) are known to occur, and southern green sturgeon (federally listed as threatened and a California species of special concern) could occur, in the tidal reaches of South Bay sloughs, as shown on Figure 3.4-15 and described as follows:

- Green sturgeon and white sturgeon can occur in outer Faber Marsh and along lower San Francisquito Creek, lower Permanente Creek/Mountain View Slough, lower Stevens Creek/Williamson Slough, Guadalupe Slough, Moffett Channel, Lower Calabazas Creek, lower San Tomas Aquino Creek, Alviso Slough, and Coyote Slough (including the Coyote Creek main stem and bypass).
- San Francisco Bay-Delta longfin smelt can occur in outer Faber Marsh and along lower Guadalupe Slough, and lower Coyote Slough (including the Coyote Creek main stem but not the Coyote Creek bypass).

While Figure 3.4-15 indicates the geographic areas where maintenance activities are most likely to occur in habitat for these species, activities could occur throughout these tidal reaches in the Program Renewal Area.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities could result in a variety of impacts on special-status fish, including direct and indirect impacts on individuals and temporary and permanent impacts on suitable habitat. Longfin smelt utilize tidal habitats in the Program Renewal Area for spawning, rearing, and foraging, while the green and white sturgeon would occur only as nonbreeding foragers. Thus, Program Renewal activities could affect the survival of all of these species, as well as the reproduction and/or growth of longfin smelt where they occur in the Program Renewal Area. Because the extent of Program Renewal impacts within tidal habitats for these species would be very limited, and because these species occur infrequently and in low numbers, if at all, within the tidal reaches of Program Renewal Area

streams where Program Renewal impacts are expected to occur, Program Renewal impacts on individuals of these species would be considered less than significant under CEQA.

No relocation of tidal aquatic vertebrates is proposed under the Program Renewal.

The total estimated acreages of Program Renewal impacts along streams where longfin smelt, white sturgeon, and green sturgeon potentially occur are provided in Table 3.4-11. Of these, impacts to vegetated wetlands (0.7 acre for longfin smelt and 10.8 acres for white sturgeon and green sturgeon) and aquatic (riverine) habitat (0.0 acres for longfin smelt and 3.7 acres for white sturgeon and green sturgeon) would occur directly within habitat for these species, impacts to herbaceous streambank vegetation (0.7 acre for longfin smelt and 12.5 acres for white sturgeon and green sturgeon) and woody riparian vegetation (0.2 acre for longfin smelt and 9.7 acres for white sturgeon and green sturgeon) would occur on stream banks within or directly upslope of suitable habitat, and impacts to other (non-developed upland) habitat (0.0 acres for longfin smelt and 0.1 acre for white sturgeon and green sturgeon) would occur outside of the stream channel. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided. As discussed under "Impact Assessment" above, although the biological resources subject to maintenance activities are often of lower quality in areas where recent maintenance has previously occurred, the discussion of the impacts that could result from Program Renewal activities is applied to biological resources in all impact areas, regardless of whether or not maintenance has recently occurred along a particular reach (i.e., the most conservative approach

is assumed). Thus, the total impact areas for 2027-2036 are ten times the annual impact areas, regardless of whether impacts may occur within the same area multiple times.

[2] All impacts of sediment removal, vegetation management (<6" dbh), and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] Grasslands, oak woodlands, and non-developed irrigated agriculture.

[4] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in temporary and permanent adverse effects to habitat used by longfin smelt, green sturgeon, and white sturgeon through dewatering, fish relocations, changes in habitat structure, and other impact pathways. If these species were to occur in reaches near maintenance activities, the health of individuals could be impaired by decreased water quality (e.g., increased turbidity resulting from sediment removal in lower reaches of creeks or spills of fuels or chemicals). However, these estuarine species are adapted to waters with high turbidity, and there is evidence that longfin smelt prefer some turbidity to provide cover from predators (Rosenfield 2010). Thus, fewer adverse effects due to increases in turbidity are expected for these tidal estuarine fish compared to freshwater fish in the Program Renewal Area. These species occur infrequently and in low numbers, if at all, in the immediate Program Renewal Area, and they are not expected to spawn in the Program Renewal Area with the exception of longfin smelt, which are known to spawn in Coyote and Alviso Sloughs (Otolith Geochemistry & Fish Ecology Laboratory 2023). Because of the infrequency of these species' occurrence in the Program Renewal Area, the very limited extent of maintenance activities in tidal habitats, and the fact that instream activities that could result in adverse water quality effects would not extend far downstream in tidal sloughs (i.e., to areas where these species were more likely to occur), a low probability would exist that maintenance activities would result in substantial adverse impacts on these species' habitats; therefore, these impacts are less than significant under CEQA.

Vegetation management activities would occur more widely adjacent to tidal waters; such activities would occur along San Francisquito Creek, the Sunnyvale West Channel, Moffett Channel, Guadalupe Slough, Coyote Slough, Alviso Slough, San Tomas Aquino Creek, and Permanente Creek. These species' habitat would be largely unaffected by stream maintenance activities, but removal of vegetation along sloughs could result in temporary, minor adverse effects to these species by reducing foraging habitat. However, organic matter from vegetation that would be modified by Program Renewal activities is likely not limiting food availability in tidal sloughs in the Program Renewal Area, and thus removal of vegetation by the Program Renewal would have no appreciable effect on food availability for longfin smelt, green sturgeon, or white sturgeon. Some potential would exist for water-quality impacts caused by drift of herbicides into tidal sloughs containing longfin smelt, green or white sturgeon. Degradation of water quality may be particularly detrimental to young fish of species that use Program Renewal Area sloughs as nursery habitat; however, such effects will be minimized by using herbicide formulations that are approved for aquatic environments and by adhering to state and federal regulations concerning herbicide use. Therefore, these impacts are less than significant under CEQA.

The Program Renewal Area contains designated critical habitat for green sturgeon (Figure 3.4-15). Stream maintenance activities would result in both negligible and adverse effects on designated critical habitat, as described above for green sturgeon habitat in general. Specifically, Program Renewal activities could impact the PBFs of critical habitat including water quality, migratory corridors, and sediment quality. As discussed above, due to the low likelihood that green sturgeon would be present within the Program Renewal impact areas when maintenance activities occur (if at all), as well as the limited extent of maintenance activities in tidal habitats, impacts of the Program Renewal on designated critical habitat for green sturgeon due to the temporary or permanent loss of suitable aquatic habitat supporting PBFs would be considered less than significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on estuarine, special-status fish:

- **BMP GEN-2: Instream Herbicide Application** includes general measures to minimize effects of herbicides on aquatic communities.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of the longfin smelt, white sturgeon, and green sturgeon.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.

- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-41: Dewatering in Tidal Work Areas** provides procedures for diverting water around work areas and excluding fish from work areas in tidal locations to avoid and minimize impacts to water quality and special-status fish.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within non-tidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of estuarine, special-status fish within the Program Renewal Area, as these species are not covered under the VHP and the VHP permit area does not (and will not in the future) extend into tidal areas where these species occur. Because the VHP permit area does not extend into these species' habitats, compliance with habitat plan conditions and the payment of VHP land cover fees and specialty fees are not expected to reduce impacts of the Program Renewal on these species and their habitats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

No VHP-covered activities will affect the longfin smelt, white sturgeon, and/or green sturgeon or their habitats, as the VHP permit area does not (and will not in the future) extend into tidal habitats.

Activities Not Covered under the VHP

Impacts of non-VHP-covered Program Renewal activities on the longfin smelt, white sturgeon, and green sturgeon and their habitat are considered less than significant under CEQA due to the small number of individuals and limited areas of suitable habitat that would be adversely affected by Program Renewal activities, coupled with the implementation of

Program Renewal BMPs. As a result, potential Program Renewal impacts on these species and their habitats are effectively minimized. No mitigation measures are necessary.

Herbicide application could affect estuarine, special-status fish in the Program Renewal Area. However, as discussed for CCC and SCCC steelhead above, Valley Water will implement BMPs, including BMP GEN-2, to minimize the effects of herbicides on aquatic species and their habitats. With the implementation of these measures, herbicides would not be applied using methods that could result in direct or indirect impacts on native special-status fish. Thus, with the implementation of BMPs, impacts of herbicide application on these species would be effectively minimized, and no mitigation measures are necessary.

SUMMARY AND CONCLUSION

Due to the small number of individual longfin smelt, white sturgeon, and green sturgeon and limited areas of suitable habitat for these species that would be adversely affected by Program Renewal activities, coupled with implementation of BMPs, impacts on these species would be less than significant under CEQA, and no mitigation measures are necessary. Mitigation Measures that would further reduce impacts on these species and their habitat include Mitigation Measures BIO-8 and BIO-13.

Impact BIO-1I: Impacts on Essential Fish Habitat and Species Subject to Fisheries Management Plans (Less than Significant)

IMPACT ASSESSMENT

The Central Valley fall-run Chinook salmon is a California species of special concern, and as noted in Section 3.4.2, "Regulatory Setting," it is the only fish species subject to a fisheries management plan that occurs in the nontidal portions of the Program Renewal Area. This species is regulated by the Pacific Fishery Management Council's *Salmon Fishery Management Plan* (Pacific Fishery Management Council 2024a). Although the Chinook salmon currently occurring in the Program Renewal Area have been recognized as strays from hatchery releases (NMFS 1999, Garcia-Rossi and Hedgecock 2002, Valley Water 2018), NMFS still considers habitat used by Chinook salmon in the South Bay as EFH. Chinook salmon occur in the Program Renewal Area in outer Faber Marsh, Guadalupe Slough, Alviso Slough, the Guadalupe River, Los Gatos Creek, Guadalupe Creek, Alamitos Creek, Coyote Slough, and Coyote Creek (Table 3.4-4). This species uses the lower reaches of streams in the Program Renewal Area as migration corridors between estuarine habitats and upstream spawning and rearing habitats. However, conditions for successful spawning in the Program Renewal Area are marginal because of low water levels in the creeks in the fall, when this species typically spawns.

Several fish species regulated by the *Pacific Groundfish Fisheries Management Plan* (Pacific Fishery Management Council 2023), such as the leopard shark, English sole, starry flounder, and big skate, occur in tidal habitats of South San Francisco Bay and could occur in the tidal reaches of tributaries to the South Bay within the Program Renewal Area. The leopard shark, English sole, starry flounder, and big skate have been documented in Alviso Slough, Coyote Slough, and Guadalupe Slough during surveys conducted by UC Davis (Otolith Geochemistry & Fish Ecology Laboratory 2023). Fish regulated by the *Coastal Pelagics Fisheries Management Plan* (Pacific Fishery Management Council 2024b), such as the northern anchovy, Pacific sardine, and jack mackerel also occur in the South Bay but are less likely to

occur in the uppermost tidal reaches of sloughs where Program Renewal maintenance activities would take place (Otolith Geochemistry & Fish Ecology Laboratory 2023). Because of the presence of at least some species managed by one of these plans, tidal waters in the Program Renewal Area are considered EFH. All EFH supporting fish species regulated by these plans overlaps with EFH supporting Chinook salmon in the Program Renewal Area.

The total estimated acreages of Program Renewal impacts within EFH are provided in Table 3.4-12. Of these, impacts to vegetated wetlands (88.2 acres) and aquatic (riverine) habitat (10.2 acres) would occur directly within habitat for these species, impacts to herbaceous streambank vegetation (223.3 acres) and woody riparian vegetation (18.4 acres) would occur on stream banks within or directly upslope of suitable habitat, and impacts to other (non-developed upland) habitat (212.3 acres) would occur outside of the stream channel. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

Within the lower Guadalupe River in the Santa Clara Basin, 1,660 linear feet of the projected sediment removal work is located within specific sediment deposition reaches that are designed to capture sediment when flows exceed capacity of the main channel. These reaches run outside of, but parallel to, the main channel, and allow sediment removal activities to occur without impacting EFH and any Chinook salmon that may be present within the Guadalupe River. The estimated impacts of sediment removal on EFH provided in Table 3.4-12 have been adjusted to account for these sediment deposition reaches.

Table 3.4-12. Estimated 2027-2036 Total[1] Program Renewal Impacts on Essential Fish Habitat[5]

Community and Land Cover	Sediment Removal[2,3] (acres) – Temporary	Aquatic Herbicide Application[2] (acres) – Temporary	Vegetation Management (<6" dbh)[2] (acres) – Temporary	Tree Removal (>6" dbh) (acres) – Permanent	Mechanical Mowing (acres) – Temporary	Hand Weed Abatement (acres) – Temporary	Total (acres)
Essential Fish Habitat							
Vegetated Wetlands (Coastal and Valley Freshwater Marsh, Tidal Salt Marsh, and Tidal Brackish Marsh)	2.5	70.7	14.9	0.0	0.0	0.0	88.2
Aquatic Habitat (Riverine, Tidal, and Intertidal)	10.2	0.0	0.0	0.0	0.0	0.0	10.2
Herbaceous Streambank (California Annual Grassland)	0.0	39.5	0.8	0.0	138.1	44.9	223.3
Woody Riparian (Riparian Forest and Scrub)	0.0	6.0	11.6	0.8	0.0	0.0	18.4
Other (Non-Developed Uplands)[4]	0.0	0.0	1.0	0.2	167.9	43.1	212.3
Total	**12.7**	**116.2**	**28.3**	**1.0**	**306.0**	**88.0**	**552.3**

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided. As discussed under "Impact Assessment" above, although the biological resources subject to maintenance activities are often of lower quality in areas where recent maintenance has previously occurred, the discussion of the impacts that could result from Program Renewal activities is applied to biological resources in all impact areas, regardless of whether or not maintenance has recently occurred along a particular reach (i.e., the most conservative approach is assumed). Thus, the total impact areas for 2027-2036 are ten times the annual impact areas, regardless of whether impacts may occur within the same area multiple times.

[2] All impacts of sediment removal, vegetation management (<6" dbh), and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] The estimated impacts of sediment removal on EFH have been adjusted to account for the presence of sediment deposition reaches along the lower Guadalupe River.

[4] Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

[5] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

As described for CCC steelhead habitat under Impact BIO-1D, the primary impact to Chinook salmon EFH resulting from sediment removal would be the removal of spawning gravel. Because 2027–2036 sediment removal activities include reaches where Chinook salmon would be likely to spawn, such as in the Guadalupe River watershed, adverse impacts of sediment removal on Chinook salmon EFH may occur because of the removal of spawning gravel. Gravel removal would reduce the extent and availability of potential spawning habitat in the short term by removing existing spawning habitat and in the long term by reducing gravel supply within a creek. However, conditions for successful spawning in the Program Renewal Area are marginal because these fish spawn during fall when streamflow is generally at its lowest in these systems. Furthermore, despite occasional occurrences and successful spawning within Program Renewal Area streams, there is no evidence to suggest that Chinook salmon have become naturalized in the Program Renewal Area and as such, the run size of Chinook salmon is small and dependent on hatchery releases directly to San Francisco Bay. Therefore, impacts from sediment removal on Chinook salmon EFH within the Program Renewal Area, although adverse, would be considered less than significant under CEQA.

Temporary and permanent impacts of aquatic herbicide application, vegetation management, downed tree management, and other maintenance activities within aquatic and vegetated wetland habitats used by Chinook salmon in lower portions of watersheds (i.e., areas used for migration and rearing, but not for spawning), and within tidal areas used by other fish species regulated by fisheries management plans, would also occur. Effects to upstream habitats utilized by Chinook salmon resulting from vegetation management and downed tree management would be similar to those discussed under Impact BIO-1D; however, juvenile Chinook salmon within Program Renewal Area streams typically out-migrate February through June, spending substantially less time rearing in Program Renewal Area streams than CCC and SCCC steelhead. Therefore, effects due to vegetation management and downed tree management would be less than those expected for CCC and SCCC steelhead and less than significant under CEQA on Chinook salmon EFH. In addition, downed tree management activities would benefit fish by contributing to instream complexity and/or ensuring that existing habitat is maintained when large woody debris is retained or modified.

As discussed under Impact BIO-1H above, species' habitat within tidal portions of the Program Renewal Area would largely be unaffected by stream maintenance activities, but removal of vegetation along sloughs could result in temporary, minor adverse impacts to these species by reducing foraging habitat. Some potential would exist for water-quality impacts caused by drift of herbicides into tidal sloughs. Program Renewal activities would have limited effects on habitats and species located in tidal waters; however, degradation of water quality may be particularly detrimental to young fish of species that use South Bay sloughs as nursery habitat. Nevertheless, no substantial loss or degradation of EFH is expected to occur as a result of Program Renewal activities, and impacts on tidal EFH are less than significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on EFH and fish species regulated by the fisheries management plans:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities to avoid and minimize times of year when salmonids are most likely to be present.
- **BMP GEN-2: Instream Herbicide Application** ensures that in-stream herbicide application is limited to the period from June 15 to October 15, or until significant rainfall is forecasted or observed, when salmonids are less likely to be present. In addition, herbicides will not be applied directly to water, and herbicide application will comply with the 2014 Salmonid Injunction.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work. As feasible, staging areas and access routes will be located within existing disturbed areas and along existing access roads.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-18: Salvage Native Aquatic Vertebrates from Dewatered Channels** requires implementation of a fish and native aquatic vertebrate relocation plan to ensure that fish and native aquatic vertebrates are not stranded during localized dewatering. Streams that support steelhead or Pacific lamprey will require a relocation effort and/or initial on-site monitoring by a qualified biologist, depending on seasonal conditions.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of Chinook salmon.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.

- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality and special-status fish.
- **BMP GEN-41: Dewatering in Tidal Work Areas** provides procedures for diverting water around work areas in tidal locations to avoid and minimize impacts to water quality and aquatic species.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within non-tidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of fish species regulated by the *Pacific Groundfish Fisheries Management Plan* or *Coastal Pelagics Fisheries Management Plan*, as these species are not covered under the VHP and the VHP permit area does not (and will not in the future) extend into tidal areas where these species occur. Because the VHP permit area does not extend into these species' habitats, compliance with habitat plan conditions and the payment of VHP land cover fees and specialty fees are not expected to reduce impacts of the Program Renewal on these species and their habitats.

Within the VHP permit area, no VHP conditions protect the Chinook salmon, as this species is not covered under the VHP or expected to be covered under the VHP in the future. However, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on the Chinook salmon and its habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on aquatic habitats:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on nontidal habitats for Chinook salmon in the Program Renewal Area, including specialty fees per acre of impacts to riparian forest and scrub and coastal and valley freshwater marsh habitats as well as per linear foot of impacts to streams; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

No VHP-covered activities will affect fish species regulated by the *Pacific Groundfish Fisheries Management Plan* or *Coastal Pelagics Fisheries Management Plan* or their habitats, as the VHP permit area does not (and will not in the future) extend into tidal habitats.

The majority of Program Renewal activities within nontidal habitats will be covered under the VHP once the amendment is approved. No Program Renewal impacts on Chinook salmon or other EFH-associated fish species are covered under the VHP, and these species are not anticipated to be added as VHP-covered species in the future. Thus, compliance with VHP conditions will not include measures specifically designed to avoid and minimize impacts on Chinook salmon or other EFH-associated fish as a result of the Program Renewal. However, for VHP-covered activities, compliance with habitat plan conditions and payment of land cover fees will reduce impacts on Chinook salmon and other EFH-associated fish species and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts), and mitigate for impacts to their habitats (i.e., by paying land cover fees). VHP impact fees paid by Valley Water for VHP-covered impacts on riparian, wetland, and stream habitats would contribute to the VHP's conservation Program Renewal, which includes riparian and wetland habitat restoration to offset impacts of VHP-covered activities. Thus, implementation of Valley Water BMPs and compliance with applicable VHP conditions would reduce impacts on riparian and wetland habitats within the VHP permit

area. In addition, VHP-covered activities will comply with requirements of Conditions 3, 4, and 5 to further protect water quality and avoid and minimize impacts to streams.

With the implementation of Program Renewal BMPs, adverse impacts of VHP-covered Program Renewal activities on individual Chinook salmon as well as on wetland and riparian habitats that support these species would be less than significant under CEQA, and no mitigation measures are necessary. Residual adverse impacts would remain due to temporary and permanent impacts to riparian and wetland habitats, as well as due to the removal of spawning gravels and/or instream habitat complexity features (e.g., due to downed tree management) important to Chinook salmon habitat and EFH. However, the majority of these impacts are expected to be temporary, as disturbed areas will typically restore to their existing conditions following maintenance activities. Some permanent impacts will occur where activities such as bank stabilization result in modifications to natural areas. Nevertheless, due to the small run size of Chinook salmon within Program Renewal Area streams, such impacts are unlikely to limit the current number of spawning adults within the Program Renewal Area. As a result, these impacts are less than significant under CEQA, and no mitigation measures are necessary.

Compliance with applicable VHP conditions and payment of VHP land cover fees would reduce impacts on riparian and wetland habitats within the VHP permit area. In addition, VHP-covered activities will comply with requirements of Conditions 3, 4, and 5 to further protect water quality and avoid and minimize impacts to streams. Mitigation Measures BIO-3, BIO-4, and BIO-5 would further benefit Chinook salmon and EFH in the Program Renewal Area by augmenting any high-quality spawning gravel that is removed during sediment removal activities, augmenting instream habitat complexity where high-quality features are removed, and replacing lost riparian and wetland habitat functions and values through restoration, preservation, or enhancement.

Activities Not Covered under the VHP

With the implementation of Program Renewal BMPs, adverse impacts of non-VHP-covered Program Renewal activities on individual Chinook salmon as well as on wetland and riparian habitats that support these species would be less than significant under CEQA, and no mitigation measures are necessary. Residual adverse impacts would remain due to temporary and permanent impacts to riparian and wetland habitats, as well as due to the removal of spawning gravels and/or instream habitat complexity features important to Chinook salmon habitat and EFH. However, the majority of these impacts are expected to be temporary, as disturbed areas will typically restore to their existing conditions following maintenance activities. Some permanent impacts will occur where activities such as bank stabilization result in modifications to natural areas. Nevertheless, due to the small run size of Chinook salmon within Program Renewal Area streams, such impacts are unlikely to limit the current number of spawning adults within the Program Renewal Area. As a result, these impacts are less than significant under CEQA, and no mitigation measures are necessary.

Mitigation Measures BIO-3, BIO-4, and BIO-5 would further benefit Chinook salmon and EFH in the Program Renewal Area by augmenting any high-quality spawning gravel that is removed during sediment removal activities, augmenting instream habitat complexity where high-quality features are removed, and replacing lost riparian and wetland habitat functions and values through restoration, preservation, or enhancement.

Herbicide application, which is not covered under the VHP, could affect EFH and fish species regulated by fisheries management plans in the Program Renewal Area. However, as discussed for CCC and SCCC steelhead above, Valley Water will implement BMPs, including BMP GEN-2, to minimize the effects of herbicides on aquatic species and their habitats. With the implementation of these measures, herbicides would not be applied using methods that could result in direct or indirect impacts on native special-status fish. Thus, with the implementation of BMPs, impacts of herbicide application on these species would be effectively minimized, and no mitigation measures are necessary.

SUMMARY AND CONCLUSION

Maintenance activities could result in direct and indirect effects on EFH and fish species regulated by the Coastal Pelagics and Pacific Groundfish Fisheries Management Plans. However, these impacts are considered less than significant under CEQA due to the small number of individuals and limited areas of suitable habitat that would be adversely affected by Program Renewal activities. With the implementation of Program Renewal BMPs, adverse impacts of non-VHP-covered Program Renewal activities on individual Chinook salmon as well as on wetland and riparian habitats that support these species would be less than significant under CEQA, and no mitigation measures are necessary.

For VHP-covered activities, compliance with applicable VHP conditions and payment of VHP land cover fees would further reduce impacts on riparian, stream, and wetland habitats within the VHP permit area. In addition, VHP-covered activities will comply with requirements of Conditions 3, 4, and 5 to further protect water quality and avoid and minimize impacts to streams.

Regardless of VHP coverage, Mitigation Measures BIO-3, BIO-4, and BIO-5 would further benefit Chinook salmon and EFH in the Program Renewal Area by augmenting any high-quality spawning gravel that is removed during sediment removal activities, augmenting instream habitat complexity where high-quality features are removed, and replacing lost riparian and wetland habitat functions and values through restoration, preservation, or enhancement.

Impact BIO-1J: Impacts on the California Tiger Salamander, California Red-Legged Frog, and Foothill Yellow-Legged Frog (Less than Significant with Mitigation)

The California tiger salamander, California red-legged frog, and foothill yellow-legged frog are discussed together because they occur in similar locations in the Program Renewal Area (i.e., primarily areas outside of the Valley floor), Program Renewal impacts on the species are similar, targeted BMPs will be implemented to protect each species, and mitigation measures to reduce impacts of the Program Renewal to less-than-significant levels under CEQA are also similar.

IMPACT ASSESSMENT

Figures 3.4-3, 3.4-4, and 3.4-5 depict the current mapped distributions of the California tiger salamander, California red-legged frog, and foothill yellow-legged frog in the Program Renewal Area, respectively. This mapping is based on known occurrences of these species (from CNDDB and Valley Water records) as well as the extent of urban and agricultural land uses on the Valley floor, which preclude the presence of viable breeding populations. Suitable habitat for foothill yellow-legged frogs is more restricted in the Program Renewal

Area compared to habitat for California tiger salamanders and California red-legged frogs because the foothill yellow-legged frog does not typically occur below major reservoirs in Santa Clara County.

The California tiger salamander, a state and federally threatened species, has been largely extirpated from the Santa Clara Valley floor, and extant populations in the Program Renewal Area are now limited primarily to areas with seasonal pools and stock ponds around its periphery (Figure 3.4-3). Within these areas, the species is most likely to be found in less heavily developed areas that have not been heavily cultivated. No suitable breeding habitat for California tiger salamanders is present along Program Renewal Area streams, which do not support seasonal ponds or pools lacking nonnative predators, and California tiger salamanders have not been detected breeding along these streams during SMP-1 and SMP-2 maintenance activities or associated pre-activity surveys conducted by Valley Water. Further, although individuals have been recorded along or adjacent to some of the creeks in the Program Renewal Area (e.g., San Francisquito Creek, Matadero Creek, Permanente Creek, Guadalupe Creek, Calero Creek, Thompson Creek, Upper Silver Creek, Coyote Creek, and Uvas Carnadero Creek) (Figure 3.4-3), no known occurrences are located within the immediate maintenance activity impact areas. Tiger salamanders are only expected to occur within Program Renewal work areas during seasonal movements to and from breeding ponds, or possibly while using upland refugia along these streams. Due to the species' limited distribution in the Program Renewal Area, as well as the low probability of occurrence within maintenance activity areas, potential impacts of maintenance activities on the California tiger salamander and its habitat are relatively limited. However, where work areas are located within potential dispersal distance (1.3 miles) of breeding ponds, with no intervening dispersal barriers, individuals may travel through work locations during seasonal (wet-season) movements and may also use upland burrows and crevices within work sites as refugia year-round.

The California red-legged frog is federally listed as threatened and a California species of special concern. As discussed for the California tiger salamander above, this species has been largely extirpated from areas of the Santa Clara Valley floor that have been impacted by urban development and agricultural activities. Suitable breeding habitat for the California red-legged frog is potentially present along Program Renewal Area streams, as populations of this species are present along Matadero Creek and along Permanente Creek. In addition, single adult California red-legged frogs have been detected by Valley Water within maintenance work areas along Berryessa Creek at Piedmont Road in San Jose in 2017 and along Uvas Carnadero Creek south of State Route 25 in 2017, and there was an unconfirmed report from Llagas Creek at Rucker Avenue in Gilroy in 2016. These records indicate that the species can occasionally occur in valley floor locations even when breeding populations are absent. Additional individuals have been recorded along other creeks in the Program Renewal Area, including Adobe Creek, Calero Creek, and Coyote Creek, among others (Figure 3.4-4) (CNDDB 2024). California red-legged frogs are expected to occur within Program Renewal work areas primarily during seasonal movements to and from breeding areas, or possibly while using upland refugia along these streams, although breeding individuals can also potentially occur. Due to the species' limited distribution in the Program Renewal Area, as well as the low probability of occurrence within maintenance activity areas, potential impacts of maintenance activities on the California red-legged frog and its habitat are relatively limited. However, where work areas occur within potential breeding locations (e.g., along sections Matadero Creek and Permanente Creek where the species occurs), or are located within potential dispersal distance (1.0 mile) of breeding ponds with no

intervening dispersal barriers, individuals may be present; may travel through work locations during seasonal (wet-season) movements; and/or may also use upland burrows, crevices, woody debris, and vegetation within work sites as refugia year-round.

The foothill yellow-legged frog is state and federally listed as threatened. This species' distribution in the Program Renewal Area is primarily limited to streams above major reservoirs (Figure 3.4-5). Nevertheless, individuals have been recorded along or adjacent to several creeks where maintenance activities are projected to occur (e.g., Los Gatos Creek, Alamitos Creek, and Guadalupe Creek) (Figure 3.4-5). Although its distribution in the Program Renewal Area is more limited compared to the California tiger salamander and California red-legged frog, this species' primary habitat consists of stream channels where maintenance activities are focused, and thus Program Renewal activities occurring within the mapped distribution of this species are more likely to impact foothill yellow-legged frogs compared to California tiger salamanders and California red-legged frogs, and may also impact breeding habitat for this species. However, due to limited distribution of the foothill yellow-legged frog in the Program Renewal Area, potential impacts of maintenance activities on this species and its habitat are very limited. Nevertheless, where work areas are located within portions of the Program Renewal Area where this species potentially occurs, maintenance activities could affect breeding and nonbreeding individuals of this species, as well as suitable habitat.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on amphibians such as the California tiger salamander, California red-legged frog, and foothill yellow-legged frog, foraging or dispersal habitat for all of these species, and breeding habitat for the foothill yellow-legged frog. However, the vast majority of projected sediment removal, in-stream vegetation management, and aquatic herbicide application activities would be located in areas where these species do not currently occur (Figures 3.4-3, 3.4-4, and 3.4-5). Because most projected activities would occur in Valley-floor areas where these species are absent, impacts within areas that could support these species will be very limited.

Because California tiger salamanders are not expected to breed in Program Renewal Area channels, and individuals spend limited time above ground in upland habitats, Program Renewal activities likely would have limited effects on the survival, reproduction, and/or growth of this species. In addition, any tiger salamanders present within areas affected by maintenance activities would be likely to be underground during daylight hours and dry periods, when such activities would occur, thus reducing the potential for impacts of many maintenance activities that do not result in earthwork or soil compaction. The potential for effects on tiger salamanders resulting from Program Renewal activities would rather pertain primarily to the physical presence of people and equipment during maintenance activities. Some potential would exist for tiger salamanders to be exposed to direct and indirect disturbance from people and equipment, and maintenance activities would also reduce vegetative cover for individuals while these animals are moving aboveground.

In contrast, foothill yellow-legged frogs and at least some California red-legged frogs could breed, forage, and disperse along Program Renewal Area streams. Thus, as described under "Impacts on Common and Special-Status Fish and Wildlife" above, Program Renewal activities could affect the survival, reproduction, and/or growth of foothill yellow-legged frogs and California red-legged frogs where they occur in the Program Renewal Area. In addition, the physical presence of people and equipment during maintenance activities can

result in adverse effects on individuals due to direct and indirect disturbance, as described for California tiger salamanders above. Maintenance activities would also reduce vegetative cover for yellow-legged frogs and California red-legged frogs along streams in the Program Renewal Area.

Because California red-legged frogs and foothill yellow-legged frogs spend most of their time in moist or aquatic habitats, maintenance activities that would occur in upland areas (e.g., on levee tops and upper banks outside of the stream channel) have a lower potential to result in direct effects on these species compared to in-stream activities. In contrast, because California tiger salamanders spend most of their time in upland habitats (e.g., in burrows), in-stream maintenance activities have a lower potential to result in direct effects on this species compared to activities in upland areas.

Mitigation activities such as gravel augmentation (Mitigation Measure BIO-3) and installation of instream complexity (Mitigation Measure BIO-4) could also result in direct and indirect impacts to California red-legged frogs and foothill yellow-legged frogs during installation; however, the habitat enhancements provided by these measures would be beneficial to both of these species.

Vegetation management activities would include the application of herbicides, as discussed under "Impacts on Common and Special-Status Fish and Wildlife" above. Herbicides could result in adverse effects on California tiger salamanders, California red-legged frogs[2], and foothill yellow-legged frogs, including direct effects on the survival, reproduction, and growth of individuals, as well as indirect effects including reductions in available prey and habitat modification.

Because the California tiger salamander, California red-legged frog, and foothill yellow-legged frog are so scarce that impacts to any individuals could affect populations of these species, any take of individuals of these species that would result in a substantial (i.e., population-level) effect, and would be considered significant under CEQA.

Program Renewal activities will result in temporary and permanent impacts on breeding habitat for the foothill yellow-legged frog and California red-legged frog, and on foraging and dispersal habitat for the California tiger salamander, California red-legged frog, and foothill yellow-legged frog in portions of the Program Renewal Area where these species occur. The majority of these impacts are expected to be temporary, as disturbed upland areas will typically be revegetated following maintenance activities. However, some permanent impacts are expected to occur where activities such as bank stabilization and animal conflict

[2] Although the USEPA has determined that the pesticides proposed for use under the Program Renewal are likely to affect adversely the California red-legged frog, formal consultation between the USEPA and USFWS has not been completed. Therefore, the USEPA has not yet concluded whether each of these pesticides' registration, label, or use instructions needs to be altered so that use of a pesticide will not take or jeopardize the continued existence of the California red-legged frog. Valley Water would continue to use herbicides in compliance with existing applicable state and federal laws and in accordance with the voluntary guidelines established in the PRESCRIBE database managed by the California Department of Pesticide Regulation, which restricts the use of triclopyr in habitat occupied by the California red-legged frog. If new laws or guidelines related to herbicide use are established during the course of the Program Renewal, Valley Water will comply with those regulations as well.

management focused on burrowing mammals result in modifications to natural areas, or removal of suitable refugia.

The total estimated acreages of Program Renewal impacts within suitable habitat for the California tiger salamander, California red-legged frog, and foothill yellow-legged frog are provided in Table 3.4-13. Of these, impacts to vegetated wetlands (6.7 acres for the California red-legged frog, 16.2 acres for the California tiger salamander, and 1.2 acres for the foothill yellow-legged frog) and aquatic (riverine) habitat (1.7 acres for the California red-legged frog, 1.2 acres for the California tiger salamander, and 0.3 acre for the foothill yellow-legged frog) would affect breeding, foraging, and/or dispersal habitat for these species. Impacts within herbaceous streambank habitat (6.0 acres for the California red-legged frog, 9.9 acres for the California tiger salamander, and 0.5 acre for the foothill yellow-legged frog) and woody riparian habitat (1.3 acres for the California red-legged frog, 3.4 acres for the California tiger salamander, and 0.2 acre for the foothill yellow-legged frog) would affect foraging, dispersal, and refugial habitat for these species, as well as aestivation habitat for the California tiger salamander where burrows are present. Impacts within other (non-developed uplands) (3.0 acres for the California red-legged frog, 2.7 acres for the California tiger salamander, and 0.0 acres for the foothill yellow-legged frog) would affect dispersal habitat for the California tiger salamander and California red-legged frog, as well as aestivation habitat for the California tiger salamander where burrows are present. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided.

[2] All impacts of sediment removal, aquatic herbicide application, and vegetation management (<6" dbh) are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

[4] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

Designated critical habitat for the California tiger salamander and California red-legged frog occurs within the Program Renewal Area (Figures 3.4-3 and 3.4-4). Program Renewal activities could affect designated critical habitat for these species as described in this section and under "Impacts on Common and Special-Status Fish and Wildlife." Specifically, Program Renewal activities could affect the PBFs of California tiger salamander critical habitat involving upland habitats with subterranean refugia and upland dispersal habitat, as described generally above. Program Renewal activities could also affect the PBFs of critical habitat involving upland and dispersal habitat for the California red-legged frog. However, based on work that has occurred during SMP-1 and SMP-2, maintenance work in critical habitat for California tiger salamander and California red-legged frog is anticipated to be rare.

Impacts that result in the removal of suitable breeding, foraging, and/or dispersal habitat for the California tiger salamander, California red-legged frog, and/or foothill yellow-legged frog within the mapped distributions of these species in the Program Renewal Area (regardless of whether critical habitat is present) would be considered significant under CEQA due to the restricted habitat range remaining to these species in the Program Renewal Area.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize impacts on the California tiger salamander, California red-legged frog, and foothill yellow-legged frog and their habitats:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities to avoid and minimize times of year when special-status amphibians are most likely to be present.
- **BMP GEN-2: Instream Herbicide Application** ensures that in-stream herbicide application is limited to the period from June 15 to October 15, or until significant rainfall is forecasted or observed, when special-status amphibians are less likely to be present. In addition, this BMP provides measures to ensure that effects of instream herbicide application on aquatic wildlife are minimized.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-12: Protection of California Red-Legged Frogs and California Tiger Salamanders** requires pre-activity surveys in locations where these species are likely to be encountered, and appropriate protective measures if individuals are found. Individuals may be captured and relocated from the work area by a qualified biologist. As stated in the BMP, these pre-activity surveys and protective measures are not required for VHP-covered activities but may be implemented by Valley Water on a voluntary basis.

- **BMP GEN-13: Protection of Foothill Yellow-Legged Frogs** requires pre-activity surveys in locations where this species is likely to be encountered, and appropriate protective measures if individuals are found. Individuals may be captured and relocated from the work area by a qualified biologist. As stated in the BMP, these pre-activity surveys and protective measures are not required for VHP-covered activities but may be implemented by Valley Water on a voluntary basis.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of the California tiger salamander, California red-legged frog, and foothill yellow-legged frog.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be

managed to ensure that it does not cause water quality degradation in a live stream.

- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.
- **BMP BANK-2: Concrete Use near Waterways** provides measures to ensure that fresh concrete is isolated until it no longer poses a threat to water quality.
- **BMP ANI-4: Animal Control in Sensitive Amphibian Habitat** will ensure that no harmful fumigants will be used, that fumigants will not be used within special-status amphibian habitat, and that any live traps will have openings to allow special-status amphibians to safely exit.

In addition, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on the VHP-covered California tiger salamander, California red-legged frog, and foothill yellow-legged frog and their habitats in the Program Renewal Area, once the SMP is added to the VHP as a covered activity:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on state and federally listed species, including the California tiger salamander, California red-legged frog, and foothill yellow-legged frog.
- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

For VHP-covered activities, no species-specific protection measures are provided for the California tiger salamander, California red-legged frog, or foothill yellow-legged frog. However, as stated in BMPs GEN-12 and GEN-13, Valley Water may implement the species protection measures outlined in those BMPs for VHP-covered activities to protect these species on a voluntary basis.

Valley Water would also pay VHP land cover fees and wetland specialty fees to reduce impacts on suitable habitats; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management

targeted at creeks, wetlands, and grasslands that support the California tiger salamander, California red-legged frog, and foothill yellow-legged frog.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With implementation of BMPs, compliance with VHP conditions, and payment of VHP fees, impacts of VHP-covered Program Renewal activities on the VHP-covered California tiger salamander, California red-legged frog, foothill yellow-legged frog, and their habitats are less than significant under CEQA, and no mitigation measures are necessary.

For VHP-covered activities, no species-specific protection measures are provided for the California tiger salamander, California red-legged frog, or foothill yellow-legged frog. Valley Water may implement the species protection measures outlined in BMPs GEN-12 and GEN-13 for VHP-covered activities to protect these species on a voluntary basis.

Activities Not Covered under the VHP

Herbicide application, which is not covered under the VHP, is restricted within the areas shown on Figure 3.4-1 (which includes designated critical habitat for California red-legged frogs and additional habitat areas), and BMP GEN-2 provides a list of restrictions on herbicide use within streams in the Program Renewal Area. Herbicide use would also be subject to Program Renewal requirements, including application only during appropriate wind conditions to minimize the spread of these chemicals to untargeted areas. With the implementation of BMPs, impacts of herbicide application on the California tiger salamander, California red-legged frog, and foothill yellow-legged frog would be less than significant under CEQA.

No maintenance activities within tidal portions of the Program Renewal Area will result in adverse effects on the California tiger salamander, California red-legged frog, foothill yellow-legged frog, or their habitat, as these species do not occur within or near tidal reaches of the Program Renewal Area. For other non-VHP-covered maintenance activities, with the implementation of BMPs, effects of the Program Renewal on the California tiger salamander, California red-legged frog, foothill yellow-legged frog, and their habitat would be minimized. Residual effects of non-VHP-covered Program Renewal activities on these species and their habitat include limited temporary and permanent impacts on suitable breeding, dispersal, and foraging habitat (for all three species), and refugial habitat (for the California tiger salamander), as well as physiological stress, a potential greater risk of predation, and/or increased competition of individuals that are relocated from work areas. Due to the rarity of these species in the region and the limited availability of suitable habitat, these impacts result in substantial (i.e., population-level) effects, and would be significant under CEQA. Mitigation Measures BIO-6 and BIO-7 below would be implemented to reduce this impact to a less-than-significant level unless and until all Program Renewal activities impacting the California tiger salamander, California red-legged frog, and foothill yellow-legged frog become VHP-covered activities (at which time Valley Water will comply with all VHP conditions rather than implementing Mitigation Measures BIO-6 and BIO-7). Mitigation

provided under Mitigation Measures BIO-12 and BIO-13 would further benefit these species, if the mitigation occurs within the range of these species.

Mitigation Measure BIO-6: Avoid Impacts on California Tiger Salamander, California Red-Legged Frog, and Foothill Yellow-Legged Frog Habitat

To the maximum extent feasible, Valley Water will avoid conducting non-VHP-covered maintenance activities that do not provide an ecological benefit within portions of the Program Renewal Area that may be occupied by the California tiger salamander (as shown on Figure 3.4-3), California red-legged frog (as shown on Figure 3.4-4), or foothill yellow-legged frog (as shown on Figure 3.4-5). As discussed under *Mitigation Approach* above, ecologically beneficial activities and activities located within existing PMAs (for the activity being performed) do not require compensatory mitigation. Whether an activity is ecologically beneficial will be determined by a qualified Valley Water biologist. If all non-ecologically beneficial impacts within areas occupied by the California tiger salamander, California red-legged frog, or foothill yellow-legged frog and located outside of existing PMAs (for the activity being performed) are avoided, no compensatory mitigation (i.e., Mitigation Measure BIO-7) is required. To determine whether Program Renewal impacts would occur within the potential range of these species, Valley Water will rely on the mapping in Figures 3.4-3, 3.4-4, and 3.4-5. This mapping may be modified as appropriate over the course of the period 2027–2036 based on new information.

In addition, a Valley Water biologist will determine whether the impact areas support suitable habitat for one or more of these species. Developed and intensively managed agricultural lands without mammal burrows are considered unsuitable; all other land cover types are considered potential California tiger salamander and California red-legged frog habitat. Suitable foothill yellow-legged frog habitat consists of stream habitat and adjacent undeveloped areas.

Mitigation Measure BIO-7: Compensatory Mitigation for Impacts on Habitat for the California Tiger Salamander, California Red-Legged Frog, Foothill Yellow-Legged Frog, and Northwestern Pond Turtle

If the assessment described under Mitigation Measure BIO-6 above determines that work activities would occur within areas potentially supporting California tiger salamanders, California red-legged frogs, and/or foothill yellow-legged frogs, the impact is not in an existing PMA (for the activity being performed), and the impact is not avoided either through avoiding the work activity or through planning work in a way that results in an overall neutral or positive effect on the site's habitat function for the species, Valley Water will provide mitigation to compensate for impacts on these species and their habitat. At the end of each year's maintenance period, Valley Water will determine the extent of impacts to lands that are both within the potential range of these species and within potentially suitable habitat for the species.

If work activities will impact wetland, aquatic, and/or riparian habitats that support northwestern pond turtles, Valley Water will provide mitigation to compensate for impacts on this species and its habitat. At the end of each year's maintenance period, Valley Water will determine the extent of impacts to lands supporting this species.

Compensation for these effects may be provided by Valley Water via the payment of VHP impact fees through the Habitat Agency's Voluntary Fee Payments Policy. The VHP will require the payment of fees in accordance with the types and acreage of all land cover types impacted by the activity (including areas within and outside of waters of the U.S./state, and when no impacts on individual California tiger salamanders, California red-legged frogs, foothill yellow-legged frogs, and/or northwestern pond turtles have occurred).

Alternatively, if Valley Water staff, in consultation with resource agencies, determines that impacts on these species' habitats occur within riparian and wetland habitats, mitigation may be provided by Valley Water via the implementation of Mitigation Measures BIO-12 and/or BIO-13, as applicable. The mitigation provided will be required to be located in areas where habitat creation, restoration, and preservation will benefit the affected species, and such that mitigation according to these measures occurs at a ratio of no less than 1:1 (on an acreage basis). Valley Water will determine whether impacted habitat is suitable for this species on the basis of surveys or comparison of habitat conditions to those in known occupied areas.

SUMMARY AND CONCLUSION

Maintenance activities could affect the California tiger salamander, California red-legged frog, foothill yellow-legged frog, and their habitat within portions of the Program Renewal Area where these species occur (Figures 3.4-3, 3.4-4, and 3.4-5). Valley Water will implement applicable Program Renewal BMPs to avoid and minimize impacts on these species. In addition, VHP-covered Program Renewal activities will adhere to applicable VHP conditions to avoid and minimize impacts on these species and their habitat (i.e., Conditions 1, 3, 5, and 12), and pay VHP fees based on impacts to land cover types. With the implementation of these measures, VHP-covered Program Renewal impacts on the California tiger salamander, California red-legged frog, foothill yellow-legged frog, and their habitats are less than significant under CEQA. However, impacts of non-VHP-covered Program Renewal activities on individual California tiger salamanders, California red-legged frogs, foothill yellow-legged frogs, and their habitat are significant under CEQA due to the rarity of these species in the region. The implementation of Mitigation Measures BIO-6 and BIO-7 would reduce these impacts to a less-than-significant level.

Impact BIO-1K: Impacts on the Northwestern Pond Turtle (Less than Significant with Mitigation)

IMPACT ASSESSMENT

In the Program Renewal Area, all perennial creeks, many intermittent creeks, and most ponds have some potential to support the northwestern pond turtle, which is proposed for listing under FESA. Suitable basking, foraging, and dispersal habitat is present in aquatic habitats throughout the Program Renewal Area, and suitable nesting habitat for pond turtles is present in adjacent upland areas. Figure 3.4-6 shows records of this species from the Program Renewal Area.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on reptiles such as the

northwestern pond turtle, as well as on breeding, basking, foraging, and dispersal habitat for this species. However, the vast majority of Program Renewal activities including projected sediment removal, in-stream vegetation management, and aquatic herbicide application activities would be located on the Valley floor. Pond turtles occur in low densities in much of developed areas on the Valley floor, and they are more commonly found in more natural areas or within the foothills on either side of the Santa Clara Valley. Thus, maintenance activity impacts on this species will be limited because the majority of these activities will occur in portions of the Program Renewal Area where the species is relatively scarce. Vegetation removal activities such as aquatic herbicide application are more likely to affect habitat for this species along perennial streams in these Valley floor areas, especially since young pond turtles will use aquatic vegetation for cover.

Program Renewal activities could affect the survival, reproduction, and/or growth of northwestern pond turtles where they occur in the Program Renewal Area. In addition, the physical presence of people and equipment during maintenance activities can result in adverse effects on individuals due to direct and indirect disturbance. Vegetation management would reduce vegetative cover for pond turtles along streams in the Program Renewal Area. Pond turtle nests present within maintenance activity areas can be crushed by personnel and equipment. Because northwestern pond turtles are so rare that any occurrence of the species in the Program Renewal Area would be significant to its population, any take of individuals that results in a substantial (i.e., population-level) impact would be considered significant under CEQA.

Program Renewal activities will also result in temporary and permanent impacts on breeding, basking, foraging, and dispersal habitat for the northwestern pond turtle in portions of the Program Renewal Area where this species occurs. Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within wetlands, riparian, and upland habitats throughout the Program Renewal Area. Impacts to aquatic (riverine) habitat (114 acres) and vegetated wetlands (444 acres) would directly affect basking, foraging, and dispersal habitat for pond turtles; while impacts within riparian habitats (4,979 acres) and adjacent uplands (5,318 acres), the majority of which would occur to herbaceous riparian vegetation due to mechanical mowing and hand weed abatement, would affect nesting and dispersal habitat. The majority of these impacts are expected to be temporary, as disturbed areas will typically be revegetated following maintenance activities. However, some permanent impacts will occur where activities such as bank stabilization result in modifications to natural areas. Due to the broad scope of the Program Renewal, the extent of habitat impacts would be relatively high compared to regional habitat availability for this species. Thus, impacts of the Program Renewal over the 10-year period could substantially affect regional populations of this species due to temporary and permanent habitat loss. Due to the limited remaining occupied suitable habitat in the region, these impacts would be considered significant under CEQA.

Mitigation activities such as gravel augmentation (Mitigation Measure BIO-3) and installation of instream complexity (Mitigation Measure BIO-4) could also result in impacts to northwestern pond turtle individuals during installation; however, the net effect of these measures on turtles would be beneficial.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize impacts on the northwestern pond turtle and its habitat:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities to avoid and minimize times of year when northwestern pond turtles are less likely to be present.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-14: Protection of Northwestern Pond Turtles** requires pre-activity surveys in locations where this species is likely to be encountered, and appropriate protective measures if individuals are found. Individuals may be captured and relocated from the work area by a qualified biologist. As stated in the BMP, these pre-activity surveys and protective measures are not required for VHP-covered activities but may be implemented by Valley Water on a voluntary basis.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of the northwestern pond turtle.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.

- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMPs GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.
- **BMP BANK-2: Concrete Use near Waterways** provides measures to ensure that fresh concrete is isolated until it no longer poses a threat to water quality.

In addition, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on the VHP-covered northwestern pond turtle and its habitat in the Program Renewal Area:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on state and federally listed species, including the northwestern pond turtle.
- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

For VHP-covered activities, no species-specific protection measures are provided for the northwestern pond turtle. However, as stated in BMP GEN-14, Valley Water may implement

the species protection measures outlined in this BMP for VHP-covered activities to protect the species on a voluntary basis.

Valley Water would also pay VHP land cover fees and wetland specialty fees to reduce impacts on suitable habitats; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at creeks, wetlands, and surrounding habitats that support the northwestern pond turtle.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With implementation of BMPs, compliance with VHP conditions, and payment of VHP fees, impacts of VHP-covered Program Renewal activities on the northwestern pond turtle and its habitats are less than significant under CEQA, and no mitigation measures are necessary.

For VHP-covered activities, no species-specific protection measures are provided for the northwestern pond turtle. Valley Water may implement the species protection measures outlined in BMP GEN-14 for VHP-covered activities to protect this species on a voluntary basis.

Activities Not Covered under the VHP

Program Renewal activities within tidal portions of the Program Renewal Area have little potential to result in adverse effects on the northwestern pond turtle or its habitat, as this species occurs sparingly within tidal reaches of the Program Renewal Area. For other non-VHP-covered maintenance activities, with the implementation of BMPs, effects of the Program Renewal on the northwestern pond turtle and its habitat would be minimized. However, residual impacts would remain because it would not be feasible to avoid all individuals (particularly nests with eggs) and habitat loss. Although northwestern pond turtles are widespread in the Program Renewal Area, the species is not particularly abundant there. Because individuals of this species can be long-lived, the widespread nature of the species may belie a population that likely would decline substantially in the future because of poor reproduction, as young turtles are seen in relatively few parts of the Program Renewal Area. Therefore, the loss of individuals or of important aquatic or upland habitat could reduce the viability of a population to the extent that it would be extirpated. This impact would be considered significant under CEQA.

Because the northwestern pond turtle is widespread in the Program Renewal Area, implementation of Mitigation Measure BIO-6, which specifies avoidance of impacts of non-VHP-covered Program Renewal activities within areas where a species occurs, is not feasible for the Program Renewal. Therefore, for non-VHP-covered Program Renewal activities, Mitigation Measure BIO-7 (described under Impact BIO-1J above) will be implemented to provide compensatory mitigation for impacts to wetland, aquatic, and riparian habitats. This mitigation may take a variety of forms, but all mitigation for impacts to those habitats could benefit northwestern pond turtle upland or aquatic habitat, directly or indirectly by providing wetland, aquatic, and riparian habitat restoration, enhancement, and protection. These measures would help to maintain water quality, cover, and instream habitat

complexity while protecting upland refugia and nesting habitat. With the implementation of Mitigation Measure BIO-7, non-VHP-covered Program Renewal impacts on northwestern pond turtles are reduced to less than significant levels under CEQA.

SUMMARY AND CONCLUSION

Maintenance activities could affect the northwestern pond turtle and its habitat throughout the Program Renewal Area. Valley Water will implement applicable Program Renewal BMPs to avoid and minimize impacts on this species. In addition, VHP-covered Program Renewal activities will adhere to applicable VHP conditions to avoid and minimize impacts on this species and its habitat (i.e., Conditions 1, 3, 5, and 12), and pay VHP fees based on impacts to land cover types. With the implementation of these measures, VHP-covered Program Renewal impacts on the northwestern pond turtle and its habitat are less than significant under CEQA. However, impacts of non-VHP-covered Program Renewal activities on individuals and habitat for northwestern pond turtles are significant under CEQA due to the rarity of this species in the region. The implementation of Mitigation Measure BIO-7 would reduce these impacts to a less-than-significant level.

Impact BIO-1L: Impacts on the California Horned Lizard, Santa Cruz Black Salamander, and California Giant Salamander (Less than Significant)

The California horned lizard, Santa Cruz black salamander, and California giant salamander, all California species of special concern, are assessed together because these species are uncommon in the Program Renewal Area, especially where maintenance activities will occur; many Program Renewal impacts on these species and their habitats are expected to be similar; and impacts on these species and their habitats are less-than-significant under CEQA without implementation of BMPs, VHP conditions, or mitigation measures.

IMPACT ASSESSMENT

Suitable habitat for the California horned lizard is scarce in the Program Renewal Area, and the species has been recorded in very few locations near projected work areas (Figure 3.4-11). The California horned lizard occurs more commonly east of the Program Renewal Area in the interior of the Diablo Range, and only very sparingly on the fringes of the Program Renewal Area itself. As a result, this species likely would be present only in very low numbers within Program Renewal work areas, if at all. Nevertheless, where suitable habitat is present, small numbers of individuals can breed, forage, and disperse within maintenance activity areas, and may be affected by maintenance activities.

The Santa Cruz black salamander and California giant salamander are known to occur in the Santa Cruz Mountains and foothills within the Program Renewal Area, where limited maintenance activities are projected to occur (Figure 3.4-11). Within these areas, these species are found in moist areas, often under rocks and woody debris or along streams. Program Renewal work areas within this portion of the County provide suitable breeding, foraging, and dispersal habitat for these species.

The vast majority of Program Renewal activities, including projected sediment removal, in-stream vegetation management, and aquatic herbicide application, would be located in areas where California horned lizards, Santa Cruz black salamanders, and California giant salamanders do not occur. As a result, Program Renewal impacts within areas that could support these species would be limited. Table 3.4-5 provides estimates of temporary and

permanent impacts of Program Renewal activities within riparian and upland habitats throughout the Program Renewal Area; however, impacts within suitable habitat for the California horned lizard, Santa Cruz black salamander, and California giant salamander will occur within only a small portion of these areas. Based on estimates for other species that occur more extensively in the Program Renewal Area, it is estimated that less than 5 percent of the impacts identified in Table 3.4-5 could affect habitat for any of these species.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on amphibians and reptiles, as well as breeding, foraging, and dispersal habitat for these species. Program Renewal activities can also affect the survival, reproduction, and/or growth of California horned lizards, Santa Cruz black salamanders, and California giant salamanders where they occur in the Program Renewal Area. In addition, the physical presence of people and equipment during maintenance activities can result in adverse effects on individuals due to direct and indirect disturbance. Mitigation activities such as gravel augmentation (Mitigation Measure BIO-3) and installation of instream complexity (Mitigation Measure BIO-4) could result in adverse effects on amphibian species during installation; however, the addition of instream complexity would result in a net benefit for amphibians that use aquatic habitats.

Vegetation management activities would include the application of herbicides and surfactants. As discussed under "Impacts on Common and Special-Status Fish and Wildlife" above, herbicides and surfactants could result in adverse effects on amphibians such as the Santa Cruz black salamander and California giant salamander, including direct effects on the survival, reproduction, and growth of individuals, as well as indirect effects such as reductions in available prey and habitat modification.

The introduction of nonnative Argentine ants (*Linepithema humile*), the modification of habitats to favor these ants instead of native harvester ants (*Pogonomyrmex californicus*), and the introduction of nonnative or invasive plants that would degrade habitat quality may affect the California horned lizard. However, the likelihood of such impacts would be extremely low because suitable habitat for this species primarily occurs in uplands outside of stream maintenance work sites. Much more limited habitat for this species is present in clearings within riparian areas potentially located within stream maintenance work sites.

Due to the limited number of individual California horned lizards, Santa Cruz black salamanders, and California giant salamanders that would be affected by the Program Renewal, as well as the limited extent of Program Renewal-related habitat impacts that would occur relative to available habitats for these species in the region, Program Renewal activities would not result in any substantial (i.e., population-level) impacts on these species or their habitats. Therefore, Program Renewal impacts on these species and their habitats would be less than significant under CEQA.

Applicable Best Management Practices and VHP Conditions

Valley Water will implement the following BMPs to avoid and minimize impacts on the California horned lizard, Santa Cruz black salamander, and California giant salamander and their habitat in the Program Renewal Area:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities to avoid and minimize times of year when special-status amphibians are most likely to be present.
- **BMP GEN-2: Instream Herbicide Application** ensures that in-stream herbicide application is limited to the period from June 15 to October 15, or until significant rainfall is forecasted or observed, when special-status amphibians are less likely to be present and provides measures to ensure that effects of instream herbicide application on aquatic wildlife are minimized.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-18: Salvage Native Aquatic Vertebrates from Dewatered Channels** requires implementation of a fish and native aquatic vertebrate relocation plan to ensure that fish and native aquatic vertebrates are not stranded during localized dewatering.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of the California horned lizard, Santa Cruz black salamander, and California giant salamander.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.

- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.
- **BMP BANK-2: Concrete Use near Waterways** provides measures to ensure that fresh concrete is isolated until it no longer poses a threat to water quality.
- **BMP ANI-4: Animal Control in Sensitive Amphibian Habitat** will ensure that no harmful fumigants will be used, that fumigants will not be used within special-status amphibian habitat, and that any live traps will have openings to allow special-status amphibians to safely exit.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on the protection of the California horned lizard, Santa Cruz black salamander, and California giant salamander within the Program Renewal Area, as these species are not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). These species are also not expected to be covered under the VHP in the future. However, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on the California horned lizard, Santa Cruz black salamander, and California giant salamander and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on aquatic habitats:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.

- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats for the California horned lizard, Santa Cruz black salamander, and California giant salamander in the Program Renewal Area, including specialty fees for impacts to riparian, stream, and wetland habitats. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved, although the California horned lizard, Santa Cruz black salamander, and California giant salamander are not VHP-covered species and are not proposed for addition to the VHP. Due to the limited distribution of the California horned lizard, Santa Cruz black salamander, and California giant salamander in the Program Renewal Area, the likelihood that maintenance activities will affect individuals of these species or their habitats is relatively low, and any such effects would be extremely limited. As a result, potential VHP-covered Program Renewal impacts on these species and their habitats would be less than significant under CEQA. Implementation of Valley Water BMPs and adherence to VHP conditions would further reduce impacts on the California horned lizard, Santa Cruz black salamander, and/or California giant salamander as well as their habitats within the VHP permit area. No mitigation measures are necessary.

The California horned lizard, Santa Cruz black salamander, and California giant salamander may not be adequately conserved via VHP compliance because populations are not known to occur in VHP preserves. Therefore, it cannot be assumed that compliance with the VHP would necessarily result in conservation of these species that is sufficient to offset any impacts of the Program Renewal. Nevertheless, VHP-covered Program Renewal impacts on these species remain less than significant under CEQA with the implementation of BMPs, as discussed above. No mitigation measures are necessary.

Activities Not Covered under the VHP

Herbicide application, which is not covered by the VHP, could affect Santa Cruz black salamanders and California giant salamanders in the Program Renewal Area. Herbicide use is restricted within the areas shown on Figure 3.4-1 (which includes designated critical habitat for California red-legged frogs and additional habitat areas), and BMP GEN-2 provides a list of restrictions on herbicide use within these areas as well as measures to minimize effects of herbicides on aquatic species and their habitats. Herbicide use would also be subject to Program Renewal requirements, including application only during appropriate wind conditions to minimize the spread of these chemicals to untargeted areas. Thus, with the implementation of BMPs, impacts of herbicide application on Santa Cruz

black salamanders and California giant salamanders would be effectively minimized, and these impacts are less than significant under CEQA. No mitigation measures are necessary.

No maintenance activities within tidal portions of the Program Renewal Area will result in adverse effects on the California horned lizard, Santa Cruz black salamander, or California giant salamander, as these species do not occur within or near tidal reaches of the Program Renewal Area. For other non-VHP-covered maintenance activities, due to the limited distribution of the California horned lizard, Santa Cruz black salamander, and California giant salamander in the Program Renewal Area, the likelihood that maintenance activities will affect individuals of these species or their habitats is relatively low, and any such effects would be extremely limited. As a result, potential non-VHP-covered Program Renewal impacts on these species and their habitats would be less than significant under CEQA. Implementation of Valley Water BMPs would further reduce impacts on the California horned lizard, Santa Cruz black salamander, and/or California giant salamander as well as their habitats within the VHP permit area. Riparian habitat mitigation provided under Mitigation Measure BIO-12 would benefit the Santa Cruz black salamander and California giant salamander, should it occur within the range of these species.

SUMMARY AND CONCLUSION

Maintenance activities could affect the California horned lizard, Santa Cruz black salamander, California giant salamander, and their habitat within portions of the Program Renewal Area where these species occur (Figure 3.4-11). Due to the limited number of individual California horned lizards, Santa Cruz black salamanders, and California giant salamanders that would be affected by the Program Renewal, as well as the limited extent of Program Renewal-related habitat impacts that would occur relative to available habitats for these species in the region, Program Renewal activities would not result in any substantial (i.e., population-level) impacts on these species or their habitats. Therefore, VHP-covered and non-VHP-covered Program Renewal impacts on these species and their habitats would be less than significant under CEQA. Implementation of BMPs and compliance with VHP conditions would effectively minimize Program Renewal impacts on individual California horned lizards, Santa Cruz black salamanders, and California giant salamanders and their habitats. No mitigation measures are necessary.

Impact BIO-1M: Impacts on Nonbreeding Special-Status Birds (Less than Significant)

The Program Renewal will include activities in or near habitats that could be used by the following nonbreeding special-status birds: the state and federally endangered California condor and California least tern; the state threatened bank swallow; and the redhead, black skimmer, least bittern, short-eared owl, and purple martin, which are California species of special concern. These species are assessed together because they are uncommon in the Program Renewal Area, especially where maintenance activities will occur; Program Renewal impacts on these species and their habitats are expected to be similar; and impacts of the Program Renewal on these species are less than significant under CEQA without implementation of BMPs, VHP conditions, or mitigation measures.

IMPACT ASSESSMENT

The California condor does not nest in Santa Clara County. Since 2011, condors have occasionally ventured into Santa Clara County, typically being seen flying high over the Diablo Range (and occasionally other areas). However, to date, condors have not been

recorded on the ground below the 1,000-foot contour (Ventana Wildlife Society 2015). If condors occur in the Program Renewal Area at all, now or in the future, they would occur as foragers in extensive grasslands or agricultural areas where carrion is available, and likely would occur at higher elevations than where Program Renewal activities would occur. Due to the species' limited distribution and extremely low probability of occurrence in the Program Renewal Area, potential impacts of maintenance activities on the California condor are not expected to occur.

The California least tern does not nest in the Program Renewal Area. This species uses managed pond habitats along the edge of the San Francisco Bay, and the Bay itself, as post-breeding foraging and staging areas. However, no Program Renewal activities that would adversely affect the use of these habitats by post-breeding least terns would occur; any such activities would occur at the margins of ponds, and thus would not impact habitat used by these species or preclude the use of ponds for foraging or interior islands/levees for roosting. Due to the species' limited distribution in the Program Renewal Area and the limited potential for Program Renewal activities to affect roosting or foraging individuals, the potential for maintenance activities to impact the California least tern is very low.

The bank swallow forages aerially over habitats throughout the Program Renewal Area rarely, occurring only as a scarce transient during migration. Individuals are most likely to forage over aquatic habitats where high numbers of aerial insects are present. Due to the species' limited and infrequent occurrence in maintenance activity areas, as well as its limited use of the Program Renewal Area only for foraging during migration, maintenance activity impacts on bank swallows would be very low.

The redhead has been recorded nesting in the Program Renewal Area on only a few occasions in managed ponds and wetlands such as the Palo Alto Flood Control Basin and Pond A16 at the Don Edwards National Wildlife Refuge. Redheads are not expected to nest in baylands habitats in or very close to Program Renewal work areas and thus would not be impacted by Program Renewal activities.

The short-eared owl is a migrant and winter visitor that has historically bred only very locally and sporadically in the South Bay. It is unlikely that this species currently breeds in the Program Renewal Area. If it still breeds in the area, the Palo Alto Flood Control Basin is the only likely nesting area for the species. Any maintenance activities in the vicinity of the Flood Control Basin most often would occur along its periphery, whereas short-eared owls would nest toward the interior of the Flood Control Basin. Thus, Program Renewal activities are unlikely to affect an active nest of this species. Maintenance activities are unlikely to disturb roosting or foraging short-eared owls, as individuals are not likely to occur close enough to maintenance activity areas during the daytime such that disturbance of individuals would occur.

The least bittern has historically been a rare nonbreeding visitor to the Program Renewal Area, but a pair was documented nesting at Calero Reservoir in 2022. No suitable nesting habitat for this species is present within or adjacent to maintenance activity areas, and the species will occur in these areas only as an occasional migrant, foraging in freshwater and brackish marshes. Due to the species' limited and infrequent occurrence in maintenance activity areas, as well as its limited use of the Program Renewal Area only for foraging, maintenance activity impacts on least bitterns would be very low.

The black skimmer occurs in small numbers within saline-managed pond habitats in the northernmost portion of the Program Renewal Area. This species nests on small islands within managed ponds; this nesting habitat is ephemeral, and thus is not mapped. However, no suitable nesting habitat is present within or adjacent to Program Renewal activity areas, which occur only along the margins of ponds used by this species. Individual black skimmers can occasionally roost or forage in small numbers along tidal portions of Program Renewal Area streams that are adjacent to managed ponds, but they are not expected to make regular use of these areas. Due to the species' limited use of maintenance activity areas for roosting and foraging, Program Renewal impacts on least bitterns would be limited and unlikely.

The purple martin nests outside of the Program Renewal Area above 1,000 feet in elevation in the Santa Cruz Mountains. Although nesting is possible at lower elevations within the Program Renewal Area, the species is not expected to nest within or adjacent to maintenance activity work areas. Individuals typically occur in the Program Renewal Area as scarce migrants, but pairs that nest at higher elevations in Santa Clara County are often observed foraging within the Program Renewal Area, such as at Calero Reservoir, during the nesting season. Due to the species' limited use of the Program Renewal Area for foraging, maintenance activity impacts on purple martins would be limited and unlikely.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on nonbreeding birds in the Program Renewal Area, as well as suitable roosting and foraging habitat. However, because California condors, California least terns, bank swallows, redheads, least bitterns, short-eared owls, black skimmers, and purple martins do not nest within or close enough to maintenance activity areas to be affected by those activities, and individuals spend limited time within and/or adjacent to these areas, Program Renewal activities would have no effects on the survival, reproduction, and/or growth of these species in the Program Renewal Area. Rather, the potential for effects on these species resulting from Program Renewal activities would pertain primarily to the physical presence of people and equipment during maintenance activities, which may result in the indirect disturbance of roosting or foraging individuals.

In addition, maintenance activities would result in the temporary and permanent loss and/or modification of a very limited area of roosting and foraging habitat for these species. Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within habitats throughout the Program Renewal Area that potentially support these species. However, because the California condor, California least tern, bank swallow, redhead, least bittern, short-eared owl, black skimmer, and purple martin make only very limited use of these habitats in the Program Renewal Area, only a fraction of Program Renewal impacts estimated in Table 3.4-5 would affect these species. Mercury mobilization and resulting bioconcentration of mercury in fish consumed by California least terns, redheads, least bitterns, and black skimmers could also have a risk of impacting the health of these species. However, Program Renewal activities would increase mercury levels only incrementally in prey that are consumed by these species.

Due to the limited number of individual California condors, California least terns, bank swallows, redheads, least bitterns, short-eared owls, black skimmers, and purple martins that occur in the vicinity of Program Renewal activities, as well as the limited extent of Program Renewal-related habitat impacts that would occur relative to available habitats for

these species in the region, Program Renewal impacts on these species and their habitats would be less than significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to reduce impacts on the California condor, California least tern, bank swallow, redhead, least bittern, short-eared owl, black skimmer, and purple martin and their habitat in the Program Renewal Area:

- **BMP GEN-3: Avoid Exposing Soils with High Mercury Levels** will minimize the exposure of soils containing mercury in portions of the Guadalupe River watershed affected by historic mercury mining.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions protect the California least tern, bank swallow, redhead, least bittern, short-eared owl, black skimmer, and purple martin within the Program Renewal Area, as these species are not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). These species are also not expected to be covered under the VHP in the future. Nevertheless, VHP-covered Program Renewal activities will comply with the following condition to avoid and minimize impacts on the California condor:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on fully protected species, including the California condor.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. Payment of land cover fees is expected to provide some limited benefit (due to the species' limited use of habitats in the Program Renewal Area in general) to the California condor, bank swallow, and purple martin, for which existing Habitat Agency reserves provide some suitable foraging habitat. As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP, the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly

"covered species" under the VHP. This conclusion is supported based on the potential suitability of reserve habitat for foraging California condors, bank swallows, and purple martins. Because these reserves do not include tidal habitats or extensive marshes, the payment of VHP fees would not benefit the California least tern, black skimmer, or least bittern.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved, although the California condor, California least tern, bank swallow, redhead, least bittern, short-eared owl, black skimmer, and purple martin are not VHP-covered species and are not proposed for addition to the VHP. Due to the limited occurrence of the California condor, California least tern, bank swallow, redhead, least bittern, short-eared owl, black skimmer, and purple martin in the Program Renewal Area, the likelihood that maintenance activities will affect individuals of these species is extremely low. As a result, potential VHP-covered Program Renewal impacts on these species would be less than significant under CEQA, and no mitigation measures are necessary.

Limited temporary and permanent impacts of the Program Renewal on suitable roosting and foraging habitat for the California condor, California least tern, bank swallow, redhead, least bittern, short-eared owl, black skimmer, and purple martin, and the indirect disturbance of roosting and foraging nonbreeding individuals by maintenance personnel and equipment, would also potentially occur. Due to the very limited anticipated effects of VHP-covered Program Renewal activities on habitat and individuals of these species, these impacts would be less than significant under CEQA, and no mitigation measures are necessary.

With the implementation of Program Renewal BMPs, impacts of VHP-covered Program Renewal activities on habitat for California condors, California least terns, bank swallows, redheads, least bitterns, short-eared owls, black skimmers, and purple martins would be effectively avoided and minimized. Payment of VHP fees would further reduce impacts on habitat for the California condor, bank swallow, and purple martin. No mitigation measures are necessary.

Activities Not Covered under the VHP

Due to the limited occurrence of the California condor, California least tern, bank swallow, least bittern, black skimmer, purple martin, in the Program Renewal Area, the likelihood that maintenance activities will affect individuals of these species is extremely low. As a result, potential non-VHP-covered Program Renewal impacts on these species would be less than significant under CEQA, and no mitigation measures are necessary.

Limited temporary and permanent impacts of the Program Renewal on suitable roosting and foraging habitat for the California condor, California least tern, bank swallow, least bittern, black skimmer, purple martin, and the indirect disturbance of roosting and foraging nonbreeding individuals by maintenance personnel and equipment, would also potentially occur. Due to the limited anticipated effects of non-VHP-covered Program Renewal activities on habitat for these species, these impacts would be less than significant under CEQA, and no mitigation measures are necessary.

With the implementation of Program Renewal BMPs, impacts of non-VHP-covered Program Renewal activities on individual the California condor, California least tern, bank swallow, least bittern, black skimmer, purple martin, and their habitats would be effectively avoided and minimized. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

Due to the very limited potential for Program Renewal activities to affect California condors, California least terns, bank swallows, least bitterns, black skimmers, and purple martins that would be affected by the Program Renewal, as well as the limited extent of Program Renewal-related habitat impacts that would occur relative to available habitats for these species in the region, Program Renewal activities would not result in any substantial (i.e., population-level) impacts on these species or their habitats. Therefore, VHP-covered and non-VHP-covered Program Renewal impacts on these species and their habitats would be less than significant under CEQA. Implementation of BMPs would effectively minimize VHP-covered and Program Renewal non-VHP-covered impacts on habitats for these species, and payment of VHP fees would further reduce VHP-covered impacts on habitat for the California condor, bank swallow, least bittern, and purple martin. No mitigation measures are necessary.

Impact BIO-1N: Impacts on Certain Nesting Special-Status Birds (Less than Significant)

The Program Renewal could result in impacts on several special-status birds that nest in the Program Renewal Area, including the Bryant's savannah sparrow, a California species of special concern year-round; the northern harrier, Vaux's swift, olive-sided flycatcher, and grasshopper sparrow, which are California species of special concern when nesting; and the white-tailed kite, a state fully protected species. These special-status bird species are assessed together because Program Renewal impacts on these species will be similar, and these impacts are less-than-significant under CEQA without implementation of BMPs, VHP conditions, or mitigation measures, as discussed in detail below.

IMPACT ASSESSMENT

The Bryant's savannah sparrow nests in the Program Renewal Area in tidal salt marsh, brackish marsh, diked salt marsh, and muted salt marsh habitats along the edges of the Bay; in ruderal grasslands adjacent to these habitats; and (in very limited numbers) farther inland in the Program Renewal Area in grasslands. Individuals will forage in grassland and marsh habitats throughout the Program Renewal Area year-round. However, because only limited Program Renewal activities are projected to occur within tidal and brackish marsh habitats, and the abundance of Bryant's savannah sparrows nesting on levees (as opposed to high-marsh areas) is fairly low, the number of nesting, roosting, or foraging savannah sparrows that could be impacted by maintenance activities would be low relative to regional populations.

In the Program Renewal Area, breeding grasshopper sparrows occur in grasslands in several areas in the foothills of the Santa Cruz Mountains, along the foothills of the Diablo Range from Calaveras Reservoir southeast to the hills above Pacheco Creek, and in the southeast portion of the Program Renewal Area where the hills drop down to the Pajaro River Valley (Heller 2007). They do not breed on the Valley floor, and little overlap (if any) exists between suitable grasshopper sparrow habitat and potential maintenance activities. As a result, very

few, if any, nesting, roosting, or foraging grasshopper sparrows would be adversely affected by Program Renewal activities, and only limited areas of suitable habitat may be affected.

In the northern portion of the Program Renewal Area, northern harriers nest in South Bay marshes, particularly in the interiors of larger tidal salt and brackish marshes. In the southern portion of the Program Renewal Area, northern harriers nest within and adjacent to large areas of open grassland, fallow agricultural fields, and impoundments at the South County Regional Wastewater Authority Plant. Maintenance activities are not proposed within marsh habitats and are unlikely to disturb an active northern harrier nest located in the interior of such habitats. Similarly, maintenance activities may occur along the margins of suitable nesting habitat in the southern portion of the Program Renewal Area (e.g., along lower Llagas Creek), and the potential for such activities to disturb a nest to the point of abandonment would be very low because harriers nest in the interiors of large expanses of open habitat, not very close to levees where Program Renewal activities would be concentrated. Because northern harriers forage widely in open areas near their preferred habitats, maintenance activities could disturb small numbers of roosting and foraging individuals that may be present within and adjacent to work areas.

The white-tailed kite nests primarily in open grassland, shrubland, and agricultural habitats that contain suitable bushes, shrubs, or trees for nesting, and active nests of this species may be present in natural lands, agricultural areas, riparian areas, and parks, as well as in urban areas located near open habitats that provide foraging opportunities. Maintenance activities can result in direct and indirect effects on active nests of this species; however, due to their low nesting density in the Program Renewal Area, only small numbers of nesting white-tailed kites would be affected. Roosting and foraging white-tailed kites, which occur more widely and may be present within and adjacent to work areas throughout the Program Renewal Area (especially near larger open habitats), may also be disturbed by maintenance activities.

Within the Program Renewal Area, the Vaux's swift nests in small numbers in residential chimneys in Los Gatos, Los Altos, Los Altos Hills, Cupertino, and Campbell, as well as in snags at higher elevations in the Santa Cruz Mountains. Where nests are located in residential areas on or near the Valley floor (where most maintenance activities will occur), they are expected to be far enough from maintenance activities such that Program Renewal impacts on an active nest are unlikely. Where nests are located in snags in the Santa Cruz Mountains, maintenance activity impacts on nesting pairs of this species are expected to be limited due to the small number of birds nesting in the Program Renewal Area as well as the limited extent of maintenance activities in these mountains. Thus, Program Renewal activities are unlikely to impact an active nest of this species. Program Renewal activities could affect small numbers of individuals that forage aerially over maintenance work areas during summer and migration.

Olive-sided flycatchers are associated with coniferous forest habitats. They breed widely in the Santa Cruz Mountains and more sparingly in the Diablo Range, but do not breed on the Santa Clara Valley floor, and relatively few pairs nest at sites below 1,000 feet in elevation. Olive-sided flycatchers are known to nest along Upper Penitencia Creek in Alum Rock Park, and occasionally around Calero Reservoir in the Program Renewal Area (Bousman 2007b). Suitable nesting habitat also is present in the Program Renewal Area along the uppermost reaches of Uvas Creek and Bodfish Creek. Because limited maintenance activities will occur in portions of the Program Renewal Area where this species is known to nest, Program

Renewal impacts on active olive-sided flycatcher nests are expected to be limited. Program Renewal activities can also affect small numbers of roosting and foraging individuals that may be present in work areas during summer and migration.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on birds in the Program Renewal Area due to direct and indirect disturbance and temporary or permanent impacts on suitable habitat. In addition, in the absence of BMPs, individuals of these species (especially eggs or young in nests) could be killed or injured during maintenance activities due to crushing by construction personnel or equipment. Activities causing a substantial increase in noise or visual disturbance near active nest locations may result in nest abandonment, and possibly the loss of eggs or young as a result. Such activities may also disturb roosting and foraging individuals, which would likely move out of the area. However, relatively limited numbers of Bryant's savannah sparrows, northern harriers, Vaux's swifts, olive-sided flycatchers, grasshopper sparrows, and white-tailed kites would be affected relative to their regional populations, and this impact would be less than significant under CEQA.

In addition, maintenance activities would result in the temporary and permanent loss and/or modification of a very limited area of nesting and foraging habitat for these species. Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within habitats throughout the Program Renewal Area that potentially support these species. However, because the Bryant's savannah sparrow, northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, and white-tailed kite make only very limited use of these habitats in the Program Renewal Area, only a fraction of Program Renewal impacts estimated in Table 3.4-5 would affect these species. Of the impacts listed in Table 3.4-5, impacts within vegetated wetlands could affect nesting and foraging habitat for the Bryant's savannah sparrow and redhead; impacts within herbaceous streambank habitats could affect nesting and foraging habitat for the Bryant's savannah sparrow and redhead; impacts within woody riparian habitats could affect nesting habitat for the white-tailed kite, Vaux's swift, and olive-sided flycatcher; and impacts within non-developed uplands could affect nesting and foraging habitat for the grasshopper sparrow, white-tailed kite, Vaux's swift, and olive-sided flycatcher, where these species occur in the Program Renewal Area.

The greatest potential for Program Renewal maintenance activities to affect Bryant's savannah sparrows is likely related to maintenance of ruderal vegetation along levees adjacent to tidal and brackish marshes, where Bryant's savannah sparrows could nest. In addition, Bryant's savannah sparrows use vegetation along the toe of the levee slope for cover, especially during very high winter tides that inundate the rest of the marsh plain. As a result, vegetation management along these levees would reduce cover for foraging and nonbreeding individuals during high winter tides. Thus, impacts of the Program Renewal on individual Bryant's savannah sparrow and their habitat would be limited. Further, vegetation management along levees may benefit Bryant's savannah sparrows by helping to maintain vegetation at an appropriate density to support suitable nesting habitat. If vegetation management were to cease, vegetation along the levees would increase in height and density to the point where it no longer would provide suitable nesting habitat. In addition, the management of invasive vegetation would benefit nesting savannah sparrows.

Herbicides used for vegetation management may deplete invertebrate prey for these species. Program Renewal activities, particularly vegetation management, may degrade habitat for these species, and may maintain habitat in a reduced-quality state so that it supports fewer individuals and/or nesting pairs over the long term. The introduction of nonnative vegetation would degrade suitable habitat for special-status bird species. Small mammal control may reduce the suitability of habitat for white-tailed kites, northern harriers, and by reducing available prey. Although maintenance activities will potentially benefit Bryant's savannah sparrows, as discussed above, these activities would reduce the quality of nesting and/or foraging habitat for other species due to the removal of trees and other vegetation, modification and disturbance of habitat. However, because of the relatively small amount of habitat for the northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, and white-tailed kite that would be affected by the Program Renewal relative to the extent of available habitat in the region, as well as anticipated benefits of maintenance activities to suitable habitat for the Bryant's savannah sparrow, impacts on habitat for these species would be very limited, and would be considered less than significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMP to reduce impacts on the Bryant's savannah sparrow, northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, and white-tailed kite:

- **BMP GEN-3: Avoid Exposing Soils with High Mercury Levels** will minimize the exposure of soils containing mercury in portions of the Guadalupe River watershed affected by historic mercury mining.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and appropriate protective measures for nesting birds.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions currently protect the Bryant's savannah sparrow, northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, or their habitat in the Program Renewal Area, as these species are not currently covered under the VHP or listed as fully protected such that VHP Condition 1 would apply. Nevertheless, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on the white-tailed kite:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on fully protected species, including the white-tailed kite.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. The Program Renewal's contribution to the Habitat Agency's reserve system via the payment of VHP land cover fees is expected to benefit the grasshopper sparrow, and white-tailed kite, which are widespread in the Program Renewal Area and expected to occur in existing Habitat Agency reserves. The payment of VHP land cover fees is expected to have no benefit to the Bryant's savannah sparrow, northern harrier, Vaux's swift, and olive-sided flycatcher, which are unlikely to make substantive use of Habitat Agency reserves. As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly "covered species" under the VHP. This conclusion is supported based on the relatively wide distribution of the grasshopper sparrow, and white-tailed kite in Santa Clara County.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. Due to the limited occurrence of the Bryant's savannah sparrow, northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, and white-tailed kite in the Program Renewal Area, the likelihood that maintenance activities will affect individuals of these species is relatively low. As a result, potential VHP-covered Program Renewal impacts on these species would be less than significant under CEQA, and no mitigation measures are necessary.

Limited temporary and permanent impacts of the Program Renewal on suitable nesting, roosting, and foraging habitat for the Bryant's savannah sparrow, northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, and white-tailed kite, and the indirect disturbance of nesting, roosting, and foraging nonbreeding individuals by maintenance personnel and equipment, would also potentially occur. Due to the limited anticipated effects of VHP-covered Program Renewal activities on individuals of and habitat for these species, these impacts would be less than significant under CEQA, and no mitigation measures are necessary.

With the implementation of Program Renewal BMPs, impacts of VHP-covered Program Renewal activities on nesting Bryant's savannah sparrows, northern harriers, Vaux's swifts, olive-sided flycatchers, grasshopper sparrows, and white-tailed kites and their habitats would be effectively avoided and minimized. In addition, payment of VHP fees would further reduce impacts on habitat for the grasshopper sparrow, and white-tailed kite. No mitigation measures are necessary.

Activities Not Covered under the VHP

Due to the limited occurrence of the Bryant's savannah sparrow, northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, and white-tailed kite, in the Program Renewal Area, the likelihood that maintenance activities will affect individuals of these species is relatively low. As a result, potential non-VHP-covered Program Renewal impacts on these species would be less than significant under CEQA.

Limited temporary and permanent impacts of the Program Renewal on suitable roosting and foraging habitat for the Bryant's savannah sparrow, northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, and white-tailed kite, and the indirect disturbance of roosting and foraging nonbreeding individuals by maintenance personnel and equipment, would also potentially occur. Due to the limited anticipated effects of non-VHP-covered Program Renewal activities on habitat for and individuals of these species, these impacts would be less than significant under CEQA. No mitigation measures are necessary.

With the implementation of Program Renewal BMPs, impacts of non-VHP-covered Program Renewal activities on habitat for the Bryant's savannah sparrow, northern harrier, Vaux's swift, olive-sided flycatcher, grasshopper sparrow, and white-tailed kite would be effectively avoided and minimized. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

Due to the limited number of individual Bryant's savannah sparrows, northern harriers, Vaux's swifts, olive-sided flycatchers, grasshopper sparrows, and white-tailed kites that would be affected by the Program Renewal, as well as the limited extent of Program Renewal-related habitat impacts that would occur relative to available habitats for these species in the region, Program Renewal activities would not result in any substantial (i.e., population-level) impacts on these species or their habitats. Therefore, VHP-covered and non-VHP-covered Program Renewal impacts on these species and their habitats would be less than significant under CEQA. Implementation of BMPs would effectively minimize VHP-covered and non-VHP-covered impacts on nesting individuals as well as habitats for these species, and payment of VHP fees would further reduce VHP-covered impacts on habitat for the grasshopper sparrow and white-tailed kite. No mitigation measures are necessary.

Impact BIO-1O: Impacts on the California Ridgway's Rail, California Black Rail, Salt Marsh Harvest Mouse, Salt Marsh Wandering Shrew, and Alameda Song Sparrow (Less than Significant with Mitigation)

The California Ridgway's rail and salt marsh harvest mouse, which are state and federally endangered and fully protected species; the California black rail, which is state threatened and a fully protected species; and the Alameda song sparrow and salt marsh wandering shrew, which are California species of special concern, are assessed together because they

occur in sensitive marsh habitats in the Program Renewal Area. The Program Renewal will avoid the loss of individuals of these species through the implementation of BMPs, and residual Program Renewal impacts on marsh habitats for these species are considered significant under CEQA and require mitigation.

IMPACT ASSESSMENT

Figure 3.4-7 depicts the locations of suitable California Ridgway's rail and California black rail nesting habitat, as well as suitable habitat for the salt marsh harvest mouse and salt marsh wandering shrew, in the Program Renewal Area within 1 mile of projected maintenance activities. Figure 3.4-13 depicts the upstream extent of suitable nesting habitat for the Alameda song sparrow along streams in the Program Renewal Area. This mapping is based on known occurrences of these species and characteristics (such as plant species composition and marsh width) of marsh habitats. Suitable nesting habitat for the Alameda song sparrow extends farther upstream compared to nesting habitat for Ridgway's rails and black rails because this species will nest in narrower strips of marsh vegetation along channels, whereas rails require much more extensive marsh habitat for breeding.

California Ridgway's rails and California black rails nest in South Bay marshes, particularly in the interiors of larger tidal and brackish marshes. While maintenance activities will occur along tidal channels in the Program Renewal Area within suitable nesting habitat for these species, these channels are located on the peripheries of marsh habitats in which these species nest. Thus, direct impacts on an active nest of California Ridgway's rails or California black rails are not expected to occur as a result of maintenance activities. However, Program Renewal activities could result in the indirect disturbance of nesting rails, as these species can be highly sensitive to disturbance. In addition, breeding and nonbreeding Ridgway's rails and black rails forage year-round within tidal habitats along the lowermost reaches of Program Renewal Area channels (Figure 3.4-7). Ridgway's rails also occasionally wander farther upstream along tidal sloughs from their typical salt marsh habitats into tidal brackish/freshwater marsh habitats, but they are expected to do so only very rarely. A single black rail has also been detected in freshwater marsh habitat at Rancho San Antonio. Thus, maintenance activities may also result in the indirect disturbance of foraging individuals of these species in areas where they occur.

Maintenance activities (aquatic herbicide application, in-stream vegetation management, and sediment removal) are projected close enough to nesting habitat for both Ridgway's rails and black rails to result in indirect effects on active nests of these species, and/or the indirect disturbance of roosting and foraging individuals, along the lower reaches of San Francisquito Creek, Permanente Creek, the Sunnyvale West Channel, and the Coyote Bypass (Figure 3.4-7). In addition, maintenance activities (aquatic herbicide application, in-stream vegetation management, sediment removal, and hand weed abatement) are projected close enough to nesting habitat for black rails and foraging habitat to Ridgway's rails to result in indirect effects on active nests of black rails and/or foraging and roosting individual Ridgway's rails and black rails along the lower reaches of Matadero Creek, Adobe Creek, Stevens Creek, the Guadalupe River, and Coyote Creek (Figure 3.4-7). Unprojected maintenance activities can also occur within and adjacent to suitable habitats for these species.

The salt marsh harvest mouse and salt marsh wandering shrew are similarly associated with tidal marsh habitat along the lower reaches of tidal channels in the northern portion of the

Program Renewal Area. Habitat for these species consists of pickleweed-dominated tidal marshes as well as diked and muted tidal marshes. Salt marsh harvest mice also have been found in dense vegetation within brackish marshes in the South Bay (H. T. Harvey & Associates 2007). Individuals may be present in low numbers throughout these habitats, including within maintenance activity areas. Maintenance activities (aquatic herbicide application, in-stream vegetation management, and sediment removal) are projected to occur within or immediately adjacent to suitable marsh habitat for these species along the lower reaches of San Francisquito Creek, Adobe Creek, Permanente Creek, Stevens Creek, the Sunnyvale West Channel, the Guadalupe River, and the Coyote Bypass (Figure 3.4-10).

The Alameda song sparrow nests in salt marsh habitats, as well as in taller vegetation along tidal sloughs in the South Bay. Because this species nests and forages in wetland and riparian habitats along tidal channels where maintenance activities will occur, maintenance activities could result in direct effects on active nests of this species, as well as the indirect disturbance of nesting birds. Nonbreeding individuals foraging along channels may also be disturbed by maintenance activities year-round. Maintenance activities (sediment removal, in-stream vegetation management, aquatic herbicide application, sediment deposition) are projected to occur along the lower reaches of all streams within the Program Renewal Area that enter the San Francisco Bay (Figure 3.4-13).

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on birds in the Program Renewal Area due to direct and indirect disturbance and temporary or permanent impacts on suitable habitat. In addition, individuals of these species (especially eggs or young in Alameda song sparrow nests) may be killed or injured during maintenance activities due to crushing by construction personnel or equipment. Activities causing a substantial increase in noise or visual disturbance near active Ridgway's rail, black rail, and/or Alameda song sparrow nest locations may result in nest abandonment, and possibly the loss of eggs or young as a result. Such activities may also disturb roosting and foraging individuals, which would likely move out of the area.

The mortality of Ridgway's rails and black rails is greatest during the winter, primarily due to predation of individuals during extreme winter high tides that force rails out of dense marsh vegetation into more open areas in transitional zones and high marsh areas located along the periphery of tidal marshes (Eddleman 1989, Albertson 1995). Human-related disturbance may increase rails' vulnerability to predators during these high tide events due to flushing, the attraction of predators, and/or the prevention of rails from seeking cover in suitable habitat areas (Evens and Page 1983, Evens and Page 1986). In addition, removal of vegetation from the sides of levees adjacent to Ridgway's rail and black rail habitat, particularly from lower portions of banks and benches, would reduce the amount of vegetative cover that may be used to conceal individuals from predators during high tides, especially during the winter. Thus, vegetation management activities that would temporarily remove this habitat (e.g., herbicide application and manual vegetation removal) would result in an adverse impact on these species.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in the injury or mortality of salt marsh harvest mice and salt marsh wandering shrews because of equipment use, vehicle traffic, and worker foot traffic. Individuals that vacate the area because of increased levels of noise and disturbance may be exposed to increased competition from conspecifics already occupying the area to

which they were displaced, and/or increased predation due to unfamiliarity with the new area or lack of sufficient cover. Removal of vegetation may also expose individual mice and shrews to predation.

Similar to habitat for Ridgway's rails and black rails discussed above, upland transitional habitat surrounding marshes provides upland refugia for salt marsh harvest mice and salt marsh wandering shrews during winter high tides that is of particular importance to these species. Thus, vegetation management activities that would temporarily remove this habitat (e.g., herbicide application and manual vegetation removal) would result in an adverse impact on these species.

Due to the sensitivity of the California Ridgway's rail, California black rail, salt marsh harvest mouse, and salt marsh wandering shrew and their limited population sizes in the Program Renewal Area, the loss of any individuals of these species due to maintenance activities such that a substantial (i.e., population-level) effect occurs would be considered significant under CEQA. Due to the potential for maintenance activities to result in the loss of relatively large numbers of Alameda song sparrows relative to their regional populations, impacts of maintenance activities on individuals of this species such that a substantial (i.e., population-level) effect would occur would also be considered significant under CEQA.

Maintenance activities also could remove or modify relatively narrow areas of suitable nesting and foraging habitat for Ridgway's rails and black rails; similarly narrow areas of suitable habitat for salt marsh harvest mice and wandering shrews; and high-tide refugial habitat for Ridgway's rails, black rails, salt marsh harvest mice, and salt marsh wandering shrews. In addition, these activities could remove or modify a substantial area of nesting and foraging habitat for Alameda song sparrows, which nest and forage along Program Renewal Area channels. Unlike common yellowthroats (discussed separately under Impact BIO-1P below), maintenance activities are not expected to enhance habitat for Alameda song sparrows, which nest primarily in marsh vegetation. Rather, maintenance activities could degrade or remove marsh habitat within the Program Renewal Area. The introduction of nonnative vegetation would also degrade suitable marsh habitat for special-status bird species, especially in sensitive tidal and brackish marsh habitats.

The total estimated acreages of Program Renewal impacts within suitable habitat for the California Ridgway's rail, California black rail, salt marsh harvest mouse, salt marsh wandering shrew, and Alameda song sparrow are provided in Table 3.4-14. Of these, impacts to vegetated wetlands (11.0 acres for the California Ridgway's rail and California black rail, 2.7 acres for the salt marsh harvest mouse and salt marsh wandering shrew, and 21.6 acres for the Alameda song sparrow), herbaceous streambank vegetation (5.4 acres for the California Ridgway's rail and California black rail, 2.2 acres for the salt marsh harvest mouse and salt marsh wandering shrew, and 61.9 acres for the Alameda song sparrow), and woody riparian vegetation (2.1 acres for the California Ridgway's rail and California black rail, 0.5 acre for the salt marsh harvest mouse and salt marsh wandering shrew, and 4.2 acres for the Alameda song sparrow) could affect habitat for the salt marsh harvest mouse and salt marsh wandering shrew; foraging habitat and high-tide refugial habitat for the California Ridgway's rail and California black rail; and nesting and foraging habitat for the Alameda song sparrow. Impacts within aquatic (riverine) habitats and non-developed uplands are not expected to substantially affect these species, which do not make substantial use of upland areas outside of stream channels. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these

habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

Table 3.4-14. Estimated 2027-2036 Total[1] Program Renewal Impacts to Habitats for California Ridgway's Rails, California Black Rails, Salt Marsh Harvest Mice, Salt Marsh Wandering Shrews, and Alameda Song Sparrows[4]

Community and Land Cover	Sediment Removal[2] (acres) – Temporary	Aquatic Herbicide Application[2] (acres) – Temporary	Vegetation Management (<6" dbh)[2] (acres) – Temporary	Tree Removal (>6" dbh) (acres) – Permanent	Mechanical Mowing (acres) – Temporary	Hand Weed Abatement (acres) – Temporary	Total (acres)

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided.

[2] All impacts of sediment removal and aquatic herbicide application are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] Grasslands, oak woodlands, and non-developed irrigated agriculture.

[4] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

Due to extensive loss of suitable marsh and refugial habitats to support the California Ridgway's rail, California black rail, salt marsh harvest mouse, and salt marsh wandering shrew that has occurred in the San Francisco Bay, populations of these species in the Program Renewal Area are very limited. Therefore, the effects of even temporary habitat loss, or the loss of narrow areas of habitat along Program Renewal Area channels, could substantially affect regional populations of these species because their populations and available habitat are extremely limited locally and regionally. Such impacts would be considered significant under CEQA. Because maintenance activities also could affect relatively large areas of suitable nesting habitat for Alameda song sparrows, these effects would also be considered significant under CEQA due to the potential for such impacts to affect regional populations.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to reduce impacts on the California Ridgway's rail, California black rail, Alameda song sparrow, salt marsh harvest mouse, and salt marsh wandering shrew:

- **BMP GEN-3: Avoid Exposing Soils with High Mercury Levels** will minimize the exposure of soils containing mercury in portions of the Guadalupe River watershed affected by historic mercury mining.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged.
- **BMP GEN-6.1: Protection of Alameda Song Sparrow and San Francisco Common Yellowthroat** provides additional measures to ensure the protection of active nests of these species, which can be inconspicuous.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-11: Avoidance and Protection of Salt Marsh Harvest Mouse, California Ridgway's Rail, and California Black Rail** provides survey methods and appropriate protections for active nests of Ridgway's rails and black rails, as well as additional surveys and protections for salt marsh harvest mice, for work occurring in habitat for these species.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and appropriate protective measures for the California Ridgway's rail, California black rail, salt marsh harvest mouse, and salt marsh wandering shrew.

- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP ANI-2: Prevent Harm to the Salt Marsh Harvest Mouse, California Ridgway's Rail, and California Black Rail** states that no harmful fumigants will be used under the Program Renewal, and no fumigants will be used within habitat for these species.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions protect the California Ridgway's rail, California black rail, salt marsh harvest mouse, or salt marsh wandering shrew within the Program Renewal Area, as these species are not covered under the VHP and the VHP permit area does not (and will not in the future) extend into tidal areas where these species occur. Because the VHP permit area does not extend into these species' habitats, compliance with habitat plan conditions and the payment of VHP land cover fees and specialty fees are not expected to reduce impacts of the Program Renewal on these species and their habitats.

However, VHP-covered Program Renewal activities will comply with the following condition to avoid and minimize impacts on the Alameda song sparrow, within portions of the VHP permit area where this species occurs:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would

contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. However, the payment of VHP land cover fees is expected to have no benefit to the Alameda song sparrow, which does not occur within Habitat Agency reserves.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. However, no VHP-covered activities will affect the California Ridgway's rail, California black rail, salt marsh harvest mouse, salt marsh wandering shrew, or their habitats, as the VHP permit area does not (and will not in the future) extend into tidal habitats.

VHP-covered Program Renewal activities have some potential to result in direct impacts on individual Alameda song sparrows and their habitat, as this species could occur within limited portions of the VHP permit area. With implementation of BMPs to avoid the loss or disturbance of active nests, impacts of VHP-covered Program Renewal activities on individual Alameda song sparrows would be less than significant under CEQA. Any limited residual indirect disturbance of foraging individuals by maintenance personnel following implementation of BMPs would be negligible and less than significant under CEQA. No mitigation measures are necessary.

Impacts of VHP-covered activities on suitable breeding and foraging habitat for the Alameda song sparrow would be considered significant under CEQA because these habitats are extremely limited locally and regionally. The implementation of Mitigation Measure BIO-8, which includes mitigation for impacts to tidal habitats, would reduce this impact to less than significant levels. This mitigation would compensate for all impacts of VHP-covered Program Renewal activities on the Alameda song sparrow by restoring extensive vegetated tidal marsh that would provide breeding and foraging habitat for this species, thereby ensuring that the Program Renewal does not substantially reduce the number or restrict the range of this species, have a substantial adverse effect on the species, or impede the use of their nursery sites.

Mitigation Measure BIO-8. Island Ponds Mitigation

Permanent impacts to tidal marsh habitat that is in the range of these species will be mitigated by Valley Water through application of Island Ponds mitigation credit. When this is done, the mitigation will be considered to function as mitigation in perpetuity for that location. Temporary impacts to tidal marsh and permanent impacts to habitats other than tidal marsh within the mapped range of these species will be mitigated using the mitigation options described in the SMP Manual and summarized under "Mitigation Approach" above (e.g., land acquisition and conservation, trash cleanup, seeding, native plant revegetation, encampment removal, bank rehabilitation, etc.). Temporary mitigation will not be considered mitigation in perpetuity and subsequent impacts in that location will require additional mitigation. Physical breaching of the Island Pond levees, and other physical work required for this tidal restoration has already occurred, and no further activities (other than continued monitoring of marsh development per the 2002–

2012 SMP monitoring requirements) are proposed by Valley Water. Maintenance activities that occur within these species' ranges, but which are anticipated to have a neutral or positive effect on the site's habitat function, will not require compensatory mitigation. Only maintenance activities that result in a negative impact to the species' habitat as determined by a qualified biologist will require compensatory mitigation to be provided by Valley Water. Projects which are modified to provide a net positive effect on the site's function as habitat for these species will not require mitigation. If all remaining mitigation credit in the Island Ponds is exhausted during the course of the Program Renewal, Valley Water can propose additional mitigation projects to offset impacts to tidal marsh species habitats.

Activities Not Covered under the VHP

With the implementation of BMPs, effects of non-VHP-covered Program Renewal activities on the California Ridgway's rail, California black rail, Alameda song sparrow, salt marsh harvest mouse, salt marsh wandering shrew, and their habitats would be minimized. BMPs would ensure that the direct and indirect disturbance of active nests of the California Ridgway's rail, California black rail, and Alameda song sparrow is avoided, and individual salt marsh harvest mice and salt marsh wandering shrews that may be present in work areas are also avoided. Any limited residual indirect disturbance of foraging individuals by maintenance personnel following implementation of BMPs would be negligible, and these effects are less than significant under CEQA. No mitigation measures are necessary.

Residual impacts on suitable breeding and foraging habitat for these species, would be considered significant under CEQA because these habitats are extremely limited locally and regionally. In addition, residual impacts due to the loss or modification of upland transitional habitats and high-tide refugial habitats for all species except the Alameda song sparrow would also be considered significant under CEQA because these habitats are extremely limited locally and regionally, and the loss of high-tide refugia may contribute to the future loss of individual Ridgway's rails, black rails, salt marsh harvest mice, and/or salt marsh wandering shrews, which would have a substantial effect on local and regional populations. The implementation of Mitigation Measure BIO-8, which includes mitigation for impacts to tidal habitats, would reduce this impact to less-than-significant levels under CEQA by restoring extensive vegetated tidal marsh that would provide breeding and foraging habitat for these species, thereby ensuring that the Program Renewal does not substantially reduce the number or restrict the range of these species, have a substantial adverse effect on these special-status species, or impede the use of their nursery sites.

SUMMARY AND CONCLUSION

Program Renewal activities can result in significant impacts on the California Ridgway's rail, California black rail, Alameda song sparrow, salt marsh harvest mouse, and/or salt marsh wandering shrew due to the loss of individuals as well as suitable habitats. However, no VHP-covered activities will affect the California Ridgway's rail, California black rail, salt marsh harvest mouse, salt marsh wandering shrew, or their habitats, as the VHP permit area does not (and will not in the future) extend into tidal habitats.

With the implementation of BMPs, effects of Program Renewal activities on the California Ridgway's rail, California black rail, Alameda song sparrow, salt marsh harvest mouse, salt

marsh wandering shrew, and their habitats would be reduced to less than significant levels under CEQA, regardless of VHP coverage. Residual impacts on suitable breeding and foraging habitat for these species, would be considered significant under CEQA because these habitats are extremely limited locally and regionally. In addition, residual impacts due to the loss or modification of upland transitional habitats and high-tide refugial habitats for all species except the Alameda song sparrow would also be considered significant under CEQA because these habitats are extremely limited locally and regionally, and the loss of high-tide refugia may contribute to the future loss of individual Ridgway's rails, black rails, salt marsh harvest mice, and/or salt marsh wandering shrews, which would have a substantial effect on local and regional populations. The implementation of Mitigation Measure BIO-8, which includes mitigation for impacts to tidal habitats, would reduce impacts of VHP-covered activities on habitats for the Alameda song sparrow and impacts of non-VHP-covered activities on habitats for the California Ridgway's rail, California black rail, Alameda song sparrow, salt marsh harvest mouse, and salt marsh wandering shrew to less-than-significant levels under CEQA by restoring extensive vegetated tidal marsh that would provide breeding and foraging habitat for these species, thereby ensuring that the Program Renewal does not substantially reduce the number or restrict the range of these species, have a substantial adverse effect on these special-status species, or impede the use of their nursery sites.

Impact BIO-1P: Impacts on the Western Snowy Plover, Swainson's Hawk, Tricolored Blackbird, Long-Eared Owl, Loggerhead Shrike, and San Francisco Common Yellowthroat (Less than Significant)

The western snowy plover, federally threatened and a California species of special concern; the Swainson's hawk and tricolored blackbird, state threatened species; and the long-eared owl, loggerhead shrike, and San Francisco common yellowthroat, which are California species of special concern, are assessed together because the Program Renewal will avoid impacts on active nests of these species through the implementation of BMPs and adherence to VHP conditions, and residual impacts due to indirect disturbance of individuals and the loss or modification of suitable habitat are considered less than significant under CEQA.

IMPACT ASSESSMENT

Figure 3.4-8 depicts the locations of suitable western snowy plover nesting habitat in the Program Renewal Area within 1 mile of projected maintenance activities, and Figure 3.4-13 depicts the upstream extent of suitable nesting habitat for the San Francisco common yellowthroat along streams in the Program Renewal Area. This mapping is based on known occurrences of these species and characteristics of suitable habitats. Suitable nesting habitat for the San Francisco common yellowthroat extends farther upstream compared to habitat for the Alameda song sparrow (discussed separately under Impact BIO-1O above), because this species will breed in freshwater marshes; however, the greatest proportion of nesting individuals are located in brackish and freshwater marshes near the edge of the Bay. Because the tricolored blackbird is an itinerant breeder and its nesting habitat is patchily distributed, suitable nesting habitat is not mapped for this species.

The western snowy plover is associated with non-tidal, saline-managed ponds and salt panne habitats in the northernmost portion of the Program Renewal Area. Although Figure 3.4-8 depicts the locations of potential western snowy plover nesting habitat based on recent known nesting locations, the extent and location of suitable habitat may change in

the future with changes to pond management and the implementation of restoration projects. No suitable nesting habitat for snowy plovers is present within maintenance activity areas; thus, direct impacts on an active nest of western snowy plovers and suitable nesting habitat for this species are not expected to occur. However, Program Renewal activities could result in the indirect disturbance of active snowy plover nests located in adjacent areas. In addition, breeding and nonbreeding western snowy plovers forage in small numbers year-round on open levees or mudflats in maintenance activity areas located adjacent to suitable ponds (as shown on Figure 3.4-8). Maintenance activities (sediment removal, in-stream vegetation management, aquatic herbicide application, and hand weed abatement) are projected close enough to nesting habitat for the western snowy plover to result in indirect effects on active nests of this species, and/or the indirect disturbance of roosting and foraging individuals, along the lower reaches of San Tomas Aquino Creek and the Guadalupe River.

Swainson's hawks are known to nest in small numbers (i.e., one or two pairs) in southern Santa Clara County, and a pair has nested in the recent past near Coyote Creek in northern Coyote Valley where maintenance activities are projected to occur. Additional nesting pairs may occur in the Program Renewal Area vicinity in future years as the species' population continues to increase. This, nesting pairs of this species could occur along Program Renewal Area streams in the future. However, due to the small number of pairs expected to nest in the county (now and in the future), and because Swainson's hawks in the Program Renewal Area do not necessarily nest preferentially along streams, few nesting, roosting, or foraging individuals are expected to be affected by Program Renewal activities.

The tricolored blackbird is a highly colonial nester that nests uncommonly in extensive stands of tall emergent herbaceous vegetation in freshwater marshes and ponds in the Program Renewal Area. Individuals occur as nonbreeding foragers throughout the Program Renewal Area year-round. The species is not known to have nested previously within or adjacent to areas where maintenance activities are projected to occur. Locations in the Program Renewal Area where tricolored blackbirds are most likely to potentially nest include the Almaden Valley, the Coyote Valley, and South County areas.

The long-eared owl is not known to nest in the Program Renewal Area, but it has been recorded nesting just outside the Program Renewal Area in Ed Levin County Park, west of Calaveras Reservoir (Noble 2007). Accordingly, it is possible that small numbers of this species (i.e., a few pairs, at most) may nest in riparian, oak woodland, and/or mixed evergreen forest in the Program Renewal Area, particularly in foothill areas. This species is not expected to nest on the Valley floor, where the majority of Program Renewal activities are projected to occur. Due to limited numbers of this species that nest and occur within the Program Renewal Area, as well as the fact that most projected Program Renewal activities will occur in portions of the Program Renewal Area where this species is not expected to be present, maintenance activities are unlikely to impact an active nest of this species or disturb roosting and foraging individuals.

The loggerhead shrike nests in the Program Renewal Area in open grassland, shrubland, and agricultural habitats that contain suitable brush, shrubs, or trees for nesting. This species' population in Santa Clara County has declined in recent years, and it is currently known to nest regularly in small numbers only in the Gilroy area, though some potential for nesting is present in open habitats along the San Francisco Bay, in Coyote Valley, and in Morgan Hill. Relatively few nesting, roosting, or foraging individuals are expected to be affected by

Program Renewal activities due to the limited extent of maintenance activities that would occur in suitable habitat.

The San Francisco common yellowthroat is a fairly common breeder in herbaceous vegetation in fresh and brackish marshes in the northern portion of the Program Renewal Area. It is known to nest in tidal salt and brackish marshes near the edge of the South Bay, as well as in herbaceous streambank habitat and ruderal floodplain habitat along streams entering the Bay such as lower Coyote Creek and the Guadalupe River (Bousman 2007d). Individuals will also forage in wetland and riparian habitats throughout the Program Renewal Area year-round. Because this species nests and forages in wetland and riparian habitats where many maintenance activities are focused, maintenance activities could affect a relatively large number of nesting pairs and/or foraging individuals of this species over the course of the Program Renewal.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on birds in the Program Renewal Area due to direct and indirect disturbance and temporary or permanent impacts on suitable habitat. In addition, individuals of these species (especially eggs or young in San Francisco common yellowthroat or tricolored blackbird nests) may be killed or injured during maintenance activities due to crushing by construction personnel or equipment. Activities causing a substantial increase in noise or visual disturbance near active nest locations may also result in the abandonment of active nests of these bird species, and possibly the loss of eggs or young as a result. Such activities may also disturb roosting and foraging individuals, which would likely move out of the area. If a colony of tricolored blackbirds were to establish in the Program Renewal Area, maintenance activities could affect breeding productivity of a large number of individuals if the colony was disturbed, or habitat removed.

Due to the sensitivity of the western snowy plover, tricolored blackbird, Swainson's hawk, loggerhead shrike, and long-eared owl and their limited population sizes in the Program Renewal Area, the loss of individuals or active nests of these species such that a substantial (i.e., population-level) impact occurs would result in a substantial impact on regional populations and would thus be significant under CEQA. Due to the potential for maintenance activities to result in the loss of relatively large numbers of San Francisco common yellowthroat nests relative to their regional populations, impacts of maintenance activities on individuals of this species would also be considered significant under CEQA. Any indirect disturbance of foraging individuals of any of these species would be considered less than significant, as these species are highly mobile and can easily move away from work activities.

Maintenance activities also could remove or modify suitable nesting and foraging habitat for the tricolored blackbird, Swainson's hawk, loggerhead shrike, long-eared owl, and San Francisco common yellowthroat in the Program Renewal Area. No direct impacts to habitat for western snowy plovers are expected to occur; however, Table 3.4-15 provides the estimated extent of Program Renewal impacts in areas within 300 feet of mapped snowy plover habitat (0.9 acre over the 10-year Program Renewal) to illustrate the limited extent of adjacent activities.

Maintenance activities would result in the temporary and permanent loss and/or modification of a very limited area of nesting and foraging habitat for the Swainson's hawk, loggerhead shrike, and long-eared owl in the Program Renewal Area. Table 3.4-5 provides

estimates of temporary and permanent impacts of Program Renewal activities within habitats throughout the Program Renewal Area that potentially support these species. However, because the Swainson's hawk, loggerhead shrike, and long-eared owl make only very limited use of these habitats in the Program Renewal Area, only a fraction of Program Renewal impacts estimated in Table 3.4-5 would affect these species. Of the impacts listed in Table 3.4-5, impacts within woody riparian habitats and non-developed uplands would potentially affect nesting and foraging habitat for these species where they occur in the Program Renewal Area. However, suitable nesting and foraging habitat used by these species is extensively available in the Program Renewal Area vicinity. Thus, implementation of the Program Renewal is expected to have extremely limited impacts on these species' habitats and would not remove or degrade habitat such that regional populations of these species would be impacted. Therefore, Program Renewal impacts due to the loss or degradation of habitat for these three species would be less than significant.

The total estimated acreages of Program Renewal impacts within suitable habitat for the San Francisco common yellowthroat are provided in Table 3.4-15. Of these, impacts to vegetated wetlands (153.0 acres), herbaceous streambank vegetation (307.6 acres), and woody riparian vegetation (30.1 acres) could affect nesting and foraging habitat for this species, while impacts to non-developed uplands (283.1 acres) could affect foraging habitat. Based on experience from SMP-1 and SMP-2, these acreages are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities).

Valley Water studies have found that wetland vegetation often quickly re-establishes following sediment removal activities; therefore, any impacts on nesting habitat for the San Francisco common yellowthroat would be of short duration (i.e., 2–3 years). In addition, while frequent, repetitive sediment removal or vegetation management in freshwater areas would result in a long-term reduction of habitat for San Francisco common yellowthroats; less frequent, though periodic, sediment removal and herbicide application prevent succession that would ultimately convert high-quality nesting habitat for this species (consisting of emergent vegetation) to less suitable tall woody riparian habitat. Therefore, many Program Renewal activities are expected help to maintain high-quality nesting and foraging habitat for San Francisco common yellowthroats in the Program Renewal Area over the long term, at the expense of 2–3 years of habitat loss immediately following sediment removal or vegetation management. Due to these combined factors, impacts of maintenance activities on suitable habitat for the San Francisco common yellowthroat are considered less than significant under CEQA.

Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within herbaceous and woody riparian habitats throughout the Program Renewal Area, as well as adjacent uplands that provide foraging habitat. However, the majority of these impacts will occur within existing PMAs (for sediment removal, aquatic herbicide application, and vegetation management) and areas where maintenance occurs annually (for mechanical mowing and hand weed abatement), and tricolored blackbirds are not known to nest in these areas. As a result, although the Program Renewal will impact relatively large areas of habitat over the 10-year period, the potential for maintenance activities to result in the loss of nesting habitat that could be occupied by tricolored

blackbirds is extremely low. Further, no high-quality habitat for the tricolored blackbird is present along Program Renewal Area channels where maintenance activities are projected to occur. In addition, tricolored blackbird nesting sites within the Program Renewal Area that have been used in recent decades have typically been used for only 1 to several years, in part because of the nomadic nature of this species' colonies and in part because of succession (e.g., conversion of a cattail marsh into dense willows). Due to these combined factors, impacts due to the temporary loss of suitable habitat for tricolored blackbirds would be considered less than significant under CEQA because: (1) habitat availability would not limit the occurrence of tricolored blackbirds in the Program Renewal Area, based on the availability of suitable nesting habitat in some areas that have not been occupied in years; (2) no high-quality habitat exists with regular tricolored blackbird use that is projected to be impacted by maintenance activities; and (3) the sites within the Program Renewal Area that have been used in recent decades have typically been used for only 1 to a few years, in part because of the nomadic nature of this species' colonies and in part because of succession (e.g., conversion of a cattail marsh into dense willows).

Table 3.4-15. Estimated 2027-2036 Total[1] Program Renewal Impacts to Habitats for San Francisco Common Yellowthroats and Adjacent to Habitats for Western Snowy Plovers[4]

Community and Land Cover	Sediment Removal[2] (acres) – Temporary	Aquatic Herbicide Application[2] (acres) – Temporary	Vegetation Management (<6" dbh)[2] (acres) – Temporary	Tree Removal (>6" dbh) (acres) – Permanent	Mechanical Mowing (acres) – Temporary	Hand Weed Abatement (acres) – Temporary	Total (acres)

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided.

[2] All impacts of sediment removal, aquatic herbicide application, and vegetation management (<6" dbh) are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

[4] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to reduce impacts on the western snowy plover, San Francisco common yellowthroat, and tricolored blackbird:

- **BMP GEN-3: Avoid Exposing Soils with High Mercury Levels** will minimize the exposure of soils containing mercury in portions of the Guadalupe River watershed affected by historic mercury mining.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged.
- **BMP GEN-6.1: Protection of Alameda Song Sparrow and San Francisco Common Yellowthroat** provides additional measures to ensure the protection of active nests of these species, which can be inconspicuous.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and appropriate protective measures.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of the western snowy plover or San Francisco common yellowthroat within the Program Renewal Area, as these species are not covered under the VHP. In addition, the VHP permit area does not (and will not in the future) extend into areas where the western snowy plover occurs. Because the VHP permit area does not extend into this species' habitats, compliance with habitat plan conditions and the payment of VHP land cover fees and specialty fees are not expected to reduce impacts of the Program Renewal on this species and its habitats. However, the loggerhead shrike and Swainson's hawk are proposed for VHP coverage in the amendment currently being processed, so these species may be formally covered by the VHP once the amendment is approved. At that time, Valley Water would comply with any VHP conditions specific to these species. In addition, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on the tricolored blackbird; these conditions will also avoid and minimize impacts on habitats for the San Francisco common yellowthroat in portions of the VHP permit area where this species occurs:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.
- **Condition 17. Tricolored Blackbird** requires habitat surveys and preconstruction surveys for nesting tricolored blackbirds, as well as appropriate avoidance and minimization measures and construction monitoring to protect nesting colonies. For VHP-covered activities, this condition will replace the protections outlined in BMP GEN-6 above.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. These fees will benefit the tricolored blackbird, which is a covered species under the VHP. These fees are also expected to benefit the long-eared owl to some extent, as this species is found in more remote areas of Santa Clara County above the Valley floor, where VHP reserves are located. VHP fees are expected to have limited benefit to the loggerhead shrike and Swainson's hawk until those species are added to the VHP as covered species, at which point the VHP's conservation Program Renewal would include specific habitat preservation, enhancement, and management measures for those species. VHP fees would not benefit the western snowy plover and would have limited benefit for the San Francisco common yellowthroat, as these species do not occur within Habitat Agency reserves.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. Although the loggerhead shrike and Swainson's hawk are proposed for VHP coverage, the other bird species discussed in this impact section are not. In addition, no VHP-covered activities will affect the western snowy plover or its habitats, as the VHP permit area does not (and will not in the future) extend into tidal habitats.

VHP-covered Program Renewal activities have some potential to result in direct impacts on individual Swainson's hawks, loggerhead shrikes, long-eared owls, tricolored blackbirds, and San Francisco common yellowthroats and their habitat. Due to the limited occurrence of the Swainson's hawk, loggerhead shrike, and long-eared owl in the Program Renewal Area, the likelihood that maintenance activities will affect individuals of these species is relatively low. Nevertheless, with implementation of BMPs to avoid the loss or disturbance of active nests of Swainson's hawks, San Francisco common yellowthroats, loggerhead shrikes, and long-eared owls, impacts of VHP-covered Program Renewal activities on individuals of this species are less than significant under CEQA. Condition 17 of the VHP will replace the protections outlined in BMP GEN-6 for the tricolored blackbird. With adherence to Condition 17, impacts of VHP-covered Program Renewal activities on individual tricolored blackbirds are also less than significant under CEQA. No mitigation measures are necessary.

Due to potential benefits of maintenance activities on habitats for San Francisco common yellowthroats, impacts of VHP-covered Program Renewal activities on habitats for this species are less than significant under CEQA. Due to the broad availability of nesting habitat for tricolored blackbirds in the Program Renewal Area and other factors, impacts VHP-covered Program Renewal activities on habitats for this species are also less than significant under CEQA. In addition, because the Swainson's hawk, loggerhead shrike, and long-eared owl make only very limited use of available nesting and foraging habitats in the Program Renewal Area, only a fraction of Program Renewal impacts would affect these species. Because of the relatively small amount of habitat for the Swainson's hawk, loggerhead shrike, and long-eared owl that would be affected by the Program Renewal relative to the extent of available habitat in the region, impacts on habitat for these species would be very limited, and considered less than significant under CEQA. Nevertheless, VHP-covered activities will implement BMPs, comply with VHP conditions, and pay of VHP land cover fees and specialty fees to reduce VHP-covered Program Renewal impacts on habitats for these species. No mitigation measures are necessary.

Activities Not Covered under the VHP

Non-VHP-covered Program Renewal activities within tidal portions of the Program Renewal Area can result in adverse effects on the western snowy plover and San Francisco common yellowthroat due to the direct (for the San Francisco common yellowthroat) and indirect (for both species) impacts on active nests, as well as nesting and foraging habitat for the San Francisco common yellowthroat. Maintenance activities conducted in nontidal habitats can also result in adverse effects on the Swainson's hawk, San Francisco common yellowthroat, long-eared owl, loggerhead shrike, and tricolored blackbird, as well as suitable nesting and foraging habitat for these species.

With implementation of BMPs to avoid the loss or disturbance of active nests, impacts of non-VHP-covered Program Renewal activities on individual western snowy plovers, tricolored blackbirds, Swainson's hawks, long-eared owls, loggerhead shrikes, and San Francisco common yellowthroats are less than significant under CEQA, and no mitigation measures are necessary.

No direct impacts to habitat for western snowy plovers are expected to occur. Due to potential benefits of maintenance activities on habitats for San Francisco common yellowthroats, impacts of non-VHP-covered Program Renewal activities on habitats for this species are less than significant under CEQA. Due to the broad availability of nesting habitat for Swainson's hawks, tricolored blackbirds, loggerhead shrikes, and long-eared owls in the Program Renewal Area and other factors, impacts non-VHP-covered Program Renewal activities on habitats for this species are also less than significant under CEQA. Implementation of BMPs will further reduce impacts on habitats for San Francisco common yellowthroats, loggerhead shrikes, long-eared owls, and tricolored blackbirds. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

Program Renewal impacts within tidal portions of the Program Renewal Area can result in adverse effects on the western snowy plover and San Francisco common yellowthroat due to the direct (for the San Francisco common yellowthroat) and indirect (for both species) impacts on active nests, as well as nesting and foraging habitat for the San Francisco common yellowthroat. Maintenance activities conducted in nontidal habitats can also result in adverse effects on the Swainson's hawk, San Francisco common yellowthroat, loggerhead shrike, long-eared owl, and tricolored blackbird, as well as suitable nesting and foraging habitat for these species. No direct impacts to habitat for western snowy plovers are expected to occur.

Program Renewal impacts on habitats for the San Francisco common yellowthroat would be less than significant under CEQA because maintenance activities would provide some benefit to habitat for this species. Due to the broad availability of nesting habitat for tricolored blackbirds in the Program Renewal Area and other factors, impacts Program Renewal activities on habitats for this species are also less than significant under CEQA. No mitigation measures are necessary.

No VHP-covered activities will affect the western snowy plover or its habitats, as the VHP permit area does not (and will not in the future) extend into tidal habitats. With implementation of BMPs to avoid the loss or disturbance of active nests of Swainson's hawks, San Francisco common yellowthroats, loggerhead shrikes, and long-eared owls, impacts of VHP-covered Program Renewal activities on individuals of these species are less than significant under CEQA. Condition 17 of the VHP will replace the protections outlined in BMP GEN-6 for the tricolored blackbird. With adherence to Condition 17, impacts of VHP-covered Program Renewal activities on individual tricolored blackbirds are also less than significant under CEQA. No mitigation measures are necessary.

With implementation of BMPs to avoid the loss or disturbance of active nests, impacts of non-VHP-covered Program Renewal activities on individual Swainson's hawks, western snowy plovers, tricolored blackbirds, loggerhead shrikes, long-eared owls, and San Francisco common yellowthroats are less than significant under CEQA. Due to potential

benefits of maintenance activities on habitats for San Francisco common yellowthroats, impacts of non-VHP-covered Program Renewal activities on habitats for this species are less than significant under CEQA. Due to the broad availability of nesting habitat for Swainson's hawks, tricolored blackbirds, loggerhead shrikes, long-eared owls, in the Program Renewal Area and other factors, impacts non-VHP-covered Program Renewal activities on habitats for this species are also less than significant under CEQA. Implementation of BMPs will further reduce impacts on habitats for Swainson's hawks, San Francisco common yellowthroats, loggerhead shrikes, long-eared owls, and tricolored blackbirds. No mitigation measures are necessary.

Impact BIO-1Q: Impacts on the Least Bell's Vireo and Yellow-Breasted Chat (Less than Significant with Mitigation)

The state and federally endangered least Bell's vireo and the yellow-breasted chat, a California species of special concern, are assessed together because Program Renewal impacts on these species and their habitats will be similar, these species both occur in sensitive riparian habitats, the Program Renewal will avoid the loss of individuals through the implementation of BMPs, and residual Program Renewal impacts on riparian habitats for these species are considered significant under CEQA and require mitigation.

IMPACT ASSESSMENT

High-quality nesting habitat for the least Bell's vireo in the Program Renewal Area is located along the Pajaro River, Pacheco Creek downstream of Bell Station/Kaiser Aetna Road, Uvas Carnadero Creek south of Highway 152 West/Hecker Pass Highway, and Llagas Creek south of Highway 152 East/Pacheco Pass Highway. These areas were identified based on the few known occurrences of the species along Llagas Creek and the Pajaro River, as well as the presence of suitable high-quality riparian habitat dominated by cottonwoods and willows for nesting. These stream reaches also provide high-quality nesting habitat for yellow-breasted chats; however, the yellow-breasted chat has a patchy breeding distribution, and this species' nesting habitat is much more widespread in the Program Renewal Area compared to the least Bell's vireo (as discussed below).

The least Bell's vireo, a state and federally endangered species, was thought to have been extirpated from northern California by 1970, but in recent years populations have begun to rebound due to intensive recovery efforts (Kus 2002). The only breeding records in Santa Clara County are from Llagas Creek southeast of Gilroy in 1997 and the Pajaro River south of Gilroy in 1932. The only other confirmed records in Santa Clara County are of one or two singing males along lower Llagas Creek in May 2001, and a spring migrant in Alviso in May 2016. In future years, Least Bell's vireos may increase in number and distribution in Santa Clara County as the species' core populations, located farther to the south, increase. However, this species is unlikely to ever be more than a rare and very locally occurring breeder along South County streams due to its limited historical distribution in Santa Clara County as well as the abundance of brood-parasitic brown-headed cowbirds in the Program Renewal Area. Maintenance activities (sediment removal, in-stream vegetation management, aquatic herbicide application, mechanical mowing, and a small amount of hand weed abatement) are projected to occur along Llagas Creek and Uvas Carnadero Creek where high-quality nesting habitat for this species is present.

The yellow-breasted chat is a very scarce breeder in the Program Renewal Area due to the loss and degradation of suitable riparian breeding habitat throughout Santa Clara County as

well as the presence of brood-parasitic brown-headed cowbirds (Bousman 2007f). Optimal chat habitat is characterized by relatively large patches of riparian vegetation with a thick shrubby understory, a few taller trees, and limited overall canopy cover. In recent years, chats have been recorded in the largest numbers and most regularly (compared to other locations in the county) along lower Llagas Creek from the vicinity of the South County Regional Wastewater Authority Plant downstream to the Pajaro River (Padley 2010, H. T. Harvey & Associates 2010b). Yellow-breasted chats likely prefer this area due to the lack of development on either side of the creek as well as the weedy nature of the levee in this area, as such weedy vegetation provides attractive foraging habitat for this species adjacent to their woody riparian breeding habitat. Elsewhere in the Program Renewal Area, nesting has been confirmed most recently only along Coyote Creek upstream from U.S. Highway 101 near Hellyer Park, where a family group was seen in 1995 (S. Rottenborn, pers. obs.). However, the species may breed in small numbers elsewhere on the Valley floor (e.g., along lower Uvas/Carnadero Creek, the Pajaro River, and possibly elsewhere) in willow-dominated riparian habitats.

As discussed under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on birds in the Program Renewal Area due to direct and indirect disturbance and temporary or permanent impacts on suitable habitat. In addition, individuals of these species (especially eggs or young in nests) may be killed or injured during maintenance activities due to crushing by construction personnel or equipment. Activities causing a substantial increase in noise or visual disturbance near active nest locations may result in nest abandonment, and possibly the loss of eggs or young as a result. Due to the sensitive of the species, increased noise, movement of equipment, or human presence in upland vegetation adjacent to riparian habitats could also result in the abandonment of a territory by a pair of least Bell's vireos attempting to nest or preclude the use of habitat by a pair of vireos that would have otherwise attempted nesting. Such activities may also disturb roosting and foraging individual least Bell's vireos and yellow-breasted chats, which would likely move out of the area. Human disturbance, leading to reduced attendance of nests, could also potentially increase the risk of brood parasitism of least Bell's vireo and yellow-breasted chat nests by brown-headed cowbirds. Due to the rarity of the least Bell's vireo and yellow-breasted chat in the region, the loss of individuals of these species due to Program Renewal activities such that a substantial (i.e., population-level) impact would occur would be considered significant under CEQA.

Maintenance activities within suitable riparian habitat may also result in the temporary and permanent loss or modification of riparian habitat used for nesting by the least Bell's vireo and yellow-breasted chat. The introduction of nonnative vegetation could also degrade riparian habitats used by these species. In addition, upland vegetation adjacent to riparian habitats is frequently used for foraging, and sometimes nesting, by least Bell's vireos (USFWS 1998), and the pair that attempted nesting in 1997 along lower Llagas Creek in the Program Renewal Area was frequently seen in tall, weedy vegetation on the bank and bench outside of the willow riparian corridor (S. Rottenborn, pers. obs.). Yellow-breasted chats will use such vegetation for foraging as well. Thus, maintenance activities that result in the removal or modification of upland vegetation adjacent to riparian habitat may also affect an area's value as foraging habitat for the least Bell's vireo and yellow-breasted chat. Maintenance that is performed more frequently (e.g., annually) and removes shrubs and tall forbs from locations such as levee tops and lower maintenance roads adjacent to riparian habitat would remove foraging habitat for these species, and/or maintain habitat in a state

that would not provide suitable foraging opportunities for least Bell's vireos and yellow-breasted chats. In contrast, less periodic maintenance (e.g., every 3–4 years) would help to maintain the early seral nature of this vegetation and provide a benefit to least Bell's vireos and yellow-breasted chats.

The total estimated acreages of Program Renewal impacts within high-quality habitat for the least Bell's vireo and yellow-breasted chat are provided in Table 3.4-16. Of these, impacts to woody riparian vegetation (3.6 acres) could affect nesting and foraging habitat for these species, while impacts to herbaceous streambank vegetation (12.3 acres) and adjacent non-developed uplands (5.4 acres) could affect foraging habitat. Based on experience from SMP-1 and SMP-2, these impacts are primarily the result of restoration activities, and are expected to be overestimates of the extent of impacts within these habitats, and will encompass the acreages of all maintenance activity impacts that are included in the estimates (i.e., sediment removal, vegetation management, in-stream herbicide application, mechanical mowing, and hand weed abatement), as well as those for which estimates are not specifically provided (i.e., bank stabilization, management of animal conflicts, and minor maintenance activities). Because these areas are important to regional least Bell's vireo and yellow-breasted chat populations, such an impact on the species' populations would be substantial and considered significant under CEQA.

Table 3.4-16. Estimated 2027-2036 Total[1] Program Renewal Impacts to Habitats for Least Bell's Vireos and Yellow-Breasted Chats[4]

Community and Land Cover	Sediment Removal[2] (acres) – Temporary	Aquatic Herbicide Application[2] (acres) – Temporary	Vegetation Management (<6" dbh)[2] (acres) – Temporary	Tree Removal (>6" dbh) (acres) – Permanent	Mechanical Mowing (acres) – Temporary	Hand Weed Abatement (acres) – Temporary	Total (acres)
Least Bell's Vireo and Yellow-Breasted Chat							
Vegetated Wetlands (Coastal and Valley Freshwater Marsh)	1.3	14.0	3.0	0.0	0.0	0.0	18.3
Aquatic Habitat (Riverine)	5.3	0.0	0.0	0.0	0.0	0.0	5.3
Herbaceous Streambank (California Annual Grassland)	0.0	7.8	0.2	0.0	4.3	0.0	12.3
Woody Riparian (Riparian Forest and Scrub)	0.0	1.2	2.3	0.2	0.0	0.0	3.6
Other (Non-Developed Uplands)[3]	0.0	0.0	0.2	0.0	5.2	0.0	5.4
Total	**6.6**	**23.0**	**5.6**	**0.2**	**9.4**	**0.0**	**44.9**

[1] Impacts of ecologically beneficial activities (i.e., the removal of invasives, management of vegetation for fire resilience, maintenance of restoration sites, management of vegetation for ecological health) are not included in the totals. Impacts of all other maintenance activities not specifically listed are encompassed within the conservative estimates provided.

[2] All impacts of sediment removal, aquatic herbicide application, and vegetation removal (<6" dbh) are classified as temporary impacts, as those areas are expected to restore to their former conditions after maintenance is complete.

[3] Grasslands, chaparral and northern coastal scrub, oak woodlands, conifer woodlands, and non-developed irrigated agriculture.

[4] All acreages have been estimated by Valley Water as described under *Impact Assessment* above.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will the following BMPs to reduce impacts on the least Bell's vireo and yellow-breasted chat:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged.
- **BMP GEN-6.2: Protection of Nesting Least Bell's Vireos** provides additional survey parameters and restrictions on maintenance activities in least Bell's vireo habitat, as well as appropriate protections for active nests of this species.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as appropriate protective measures for active nests.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.

- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of the yellow-breasted chat within the Program Renewal Area, as this species is not covered under the VHP. However, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on the least Bell's vireo and riparian habitats; these conditions will also avoid and minimize impacts on habitats for the yellow-breasted chat in portions of the VHP permit area where this species occurs:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on state and federally listed species, including the least Bell's vireo.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 16. Least Bell's Vireo** requires all covered projects within mapped survey areas for this species to conduct habitat surveys and preconstruction surveys and implement avoidance and minimization measures to protect active nests. For VHP-covered activities, this condition will replace the protections outlined in BMP GEN-6.2 above.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With the implementation of Program Renewal BMPs, compliance with applicable VHP conditions, and payment of VHP impact fees, impacts of VHP-covered Program Renewal activities on the VHP-covered least Bell's vireo are less than significant under CEQA, and no mitigation measures are necessary. For VHP-covered activities, Condition 16 of the VHP will replace the protections outlined in BMP GEN-6.2.

With the implementation of Program Renewal BMPs to avoid the loss or disturbance of active nests, impacts of VHP-covered Program Renewal activities on individuals of this species are also less than significant under CEQA. However, residual impacts on riparian habitat would remain. The Program Renewal's contribution to the Habitat Agency's reserve system via the payment of VHP land cover fees is expected to benefit the yellow-breasted chat, which is expected to occur in existing Habitat Agency reserves (which target riparian habitats). As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly "covered species" under the VHP. This conclusion is

supported for the yellow-breasted chat based on the species' occurrence in riparian habitats throughout Santa Clara County, including those in Habitat Agency reserves. Thus, with the implementation of Program Renewal BMPs, compliance with applicable VHP conditions, and payment of all VHP impact fees, impacts of VHP-covered Program Renewal activities on habitat for the yellow-breasted chat are less than significant under CEQA, and no mitigation measures are necessary.

Activities Not Covered under the VHP

No maintenance activities within tidal portions of the Program Renewal Area will result in adverse effects on the least Bell's vireo, the yellow-breasted chat, or their habitats, as these species do not occur within tidal habitats in the Program Renewal Area. For other non-VHP-covered maintenance activities, with the implementation of BMPs, effects of the Program Renewal on individual least Bell's vireos and yellow-breasted chats (i.e., due to the direct and indirect disturbance of active nests) would be effectively minimized. Residual effects of non-VHP-covered Program Renewal activities on these species include temporary and permanent impacts on suitable nesting and foraging habitat, as well as the limited indirect disturbance of foraging individuals by maintenance personnel and equipment. Impacts on foraging individuals would be negligible; however, as discussed above, impacts on suitable nesting and foraging habitat for these species would be considered significant under CEQA. Mitigation Measure BIO-9 below would be implemented to reduce this impact to a less-than-significant level.

Mitigation Measure BIO-9: Compensatory Mitigation for Impacts on Least Bell's Vireo and Yellow-Breasted Chat Nesting and Foraging Habitats

If non-VHP-covered work activities would occur within areas potentially supporting nesting least Bell's vireos and/or yellow-breasted chats outside of existing PMAs, Valley Water will provide mitigation to compensate for impacts on habitat for these species. Only activities that result in a negative impact to least Bell's vireo habitat as determined by a qualified biologist will require mitigation. At the end of each year's maintenance period, Valley Water will determine the extent of impacts to lands that are within potentially suitable habitat for these species.

Compensation for these effects will be provided by Valley Water via the payment of VHP impact fees through the Habitat Agency's Voluntary Fee Payments Policy. The VHP will require the payment of fees in accordance with the types and acreage of all land cover types impacted by the activity (including when no impacts on individual least Bell's vireos and yellow-breasted chats have occurred).

Alternatively, mitigation may be provided by Valley Water via the implementation of Mitigation Measures BIO-12. The mitigation provided will be required to be located in areas where habitat creation, restoration, and preservation will benefit the affected species, and such that mitigation according to these measures occurs at a ratio of no less than 1:1 (on an acreage basis). Valley Water will determine whether impacted habitat is suitable for these species on the basis of surveys or comparison of habitat conditions to those in known occupied areas.

SUMMARY AND CONCLUSION

With implementation of BMPs, compliance with VHP conditions, and payment of VHP fees, impacts of VHP-covered Program Renewal activities on the least Bell's vireo and yellow-breasted chat and their habitats are less than significant under CEQA, and no mitigation measures are necessary.

With implementation of BMPs, impacts of VHP-covered Program Renewal activities on individual least Bell's vireos and yellow-breasted chats are less than significant under CEQA, and no mitigation measures are necessary. Although BMPs would reduce the magnitude and extent of non-VHP-covered Program Renewal impacts on habitats for these species, substantial impacts would remain due to the temporary and permanent loss of nesting and foraging habitat. Because of the rarity of these species in the region, as well as the limited extent of available suitable nesting habitat in the Program Renewal Area, such impacts on suitable nesting habitat for these species would be significant under CEQA. Mitigation Measure BIO-9 requires the payment of VHP impact fees or the provision of compensatory mitigation for impacts to riparian habitats potentially supporting these species. With the implementation of this measure, non-VHP-covered Program Renewal impacts on habitat for the least Bell's vireo and yellow-breasted chat are less than significant under CEQA.

Impact BIO-1R: Impacts on the Burrowing Owl (Less than Significant)

IMPACT ASSESSMENT

Burrowing owls occur year-round in the Program Renewal Area in agricultural and grassland habitats where burrows of California ground squirrels are present. However, the species' population in Santa Clara County has undergone a substantial decline in the past 20-30 years. Small breeding populations are known to occur at the San Jose International Airport, in the North San Jose/Alviso area, at Moffett Federal Airfield, and at Shoreline Park in Mountain View, and the Valley Habitat Agency has introduced burrowing owls elsewhere, such as near Coyote Lake Harvey Bear Ranch County Park. Burrowing owls from these populations are unlikely to nest within or adjacent to maintenance activity areas; however, this possibility cannot be ruled out. Foraging owls from breeding populations may occur in grassland habitats along nearby Program Renewal Area channels during the breeding season, and nonbreeding owls could occur more widely in grassland and agricultural habitats throughout the Program Renewal Area during migration and winter.

Burrowing owls occur in annual and perennial grassland habitats, typically with sparse or non-existent tree or shrub canopies. They exhibit strong site fidelity and may use a nesting site year after year. Burrowing owls in the Santa Clara Valley include both year-round residents and migrants that take up residency during the winter. They are routinely observed in open, agricultural, or grassland areas with active squirrel burrows. In the Program Renewal Area, particular concentrations of burrowing owls occur at the San Jose-Santa Clara Water Pollution Control Plant (WPCP) and its buffer lands and at the San Jose International Airport (Figure 3.4-12). However, this species is increasingly disappearing from "infill" locations on the urban Valley floor, and it has practically disappeared as a breeder from areas of the county south of northern San Jose. Burrowing owls were present in the Coyote Valley, Blossom Valley, and Evergreen areas in the 1990s, but they have been infrequently recorded in either area since that time. They are still occasionally recorded in Coyote Valley and in grasslands at higher elevations, such as on Coyote Ridge, but they seem to occur in such areas primarily as nonbreeders (i.e., migrants and wintering birds).

As discussed above under "Impacts on Common and Special-Status Fish and Wildlife," maintenance activities may result in direct and indirect impacts on this species. Impacts from the Program Renewal may affect burrowing owl habitat (nesting, foraging, or wintering) and/or individuals. Burrowing owls can adapt to the presence of humans and are known to nest and forage in open grassland areas adjacent to human developments. However, because they nest underground, individual burrowing owls (especially young or adults in burrows) may be killed or injured during maintenance activities from trampling by construction personnel or equipment. Maintenance activities that occur in close proximity to active burrows may disturb owls to the point of abandoning their burrows, including active nests, eggs, and young. In addition, clearing and grading for access roads, staging areas, and burrow destruction and filling work could result in the direct loss of habitat or individuals through the disturbance of grassland areas that support ground squirrel burrows, and maintenance activities may result in a reduction in the quality of breeding or foraging habitat because of the introduction of nonnative vegetation. Such impacts may occur because of both projected sediment removal and vegetation management activities and unprojected activities (e.g., bank stabilization, management of animal conflicts, and minor maintenance). Small mammal control would reduce the availability of burrows and prey for this species, resulting in the long-term degradation of habitat for breeding and wintering owls, to the extent that these owls use burrows in the levees that would be managed by Valley Water. Pesticides used for vegetation management or management of animal conflicts may deplete prey both within work sites and possibly adjacent areas.

Burrowing owls occur more widely in the South Bay in winter than they do during the breeding season. For example, burrowing owls occur on Coyote Ridge and in Coyote Valley during winter, but they have not been recorded lingering into spring and summer to breed in those areas in recent years. This suggests that wintering habitat for burrowing owls is not limiting the species' South Bay populations. As a result, impacts of Program Renewal activities on wintering owl habitat, including burrows that were occupied by owls only during the winter but that were not used for breeding, are not expected to affect appreciably regional populations of this species. However, as the availability of grassland habitat used for nesting in the Program Renewal Area continues to dwindle because of development, the South Bay breeding population of burrowing owls faces extirpation caused by lack of sufficient suitable nesting and breeding-season foraging habitat and isolation from other populations and habitat areas. Therefore, impacts to individual burrowing owls (at any time of year) and occupied breeding habitats resulting from the Program Renewal would contribute to the broader-scale decline in regional burrowing owl populations. Injury or mortality of individual burrowing owls or disturbance of nests leading to loss of eggs or chicks or abandonment of active nests that result in a substantial (i.e., population-level) effect would be a significant impact under CEQA.

In 2007 and 2008, a habitat assessment, burrow mapping study, and standardized protocol surveys for the burrowing owl were conducted along sections of multiple Valley Water-managed waterways in Palo Alto, Mountain View, Sunnyvale, Santa Clara, San Jose, Alviso, Milpitas, and Gilroy (EDAW 2008). These surveys identified active breeding and overwintering burrowing owls at a few locations in or adjacent to the Project Area (Figure 3.4-12), and potential habitat for burrowing owls was determined to be present along a number of creeks that were surveyed in the Project Area (EDAW 2008). However, no burrowing owls were recorded using Valley Water facilities, such as levees, during either of the two surveys. Similarly, a comprehensive breeding-season survey of the most likely areas

of burrowing owl occurrence in and near the VHP area in 2008 recorded no burrowing owls on Valley Water facilities (Albion Environmental 2008).

Albion Environmental (2008) assessed the potential impact of Valley Water's proposed burrow management on burrowing owls specifically for the SMP. Because no evidence existed that Valley Water levees provided important burrowing owl nesting or roosting habitat (i.e., used regularly or by a sizeable proportion of the South Bay population), Albion Environmental concluded that management of burrows on Valley Water levees would not result in a substantial impact to burrowing owl habitat.

Since 2014, the Valley Habitat Agency has conducted breeding-season burrowing owl surveys throughout much of Santa Clara County. Recent surveys (i.e., within the past 5 years) have not detected breeding burrowing owls in or near projected Program Renewal work areas (Talon Ecological Research Group 2024). Therefore, the actual impacts of Valley Water management of levees on burrowing owl populations are expected to be low.

Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within herbaceous streambank (4,888 acres) and non-developed upland (10,855 acres) habitats that potentially provide nesting and foraging habitat for burrowing owls. The majority of these impacts are expected to be temporary, as disturbed areas will typically be revegetated following maintenance activities. However, some permanent impacts will occur where activities such as bank stabilization result in modifications to natural areas. Because burrowing owl occurrence is so limited relative to the extent of potential habitat available for the species, implementation of the Program Renewal would not remove or degrade large areas of habitat such that the regional population of this species would be impacted, and surveys by the Valley Habitat Agency within the past 5 years have not detected the species breeding in or near projected Program Renewal work areas, As a result, Program Renewal impacts on habitat for the burrowing owl are considered less than significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on burrowing owls and their habitats:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged.
- **BMP GEN-7: Protection of Burrowing Owls** requires pre-activity surveys and protective measures for burrowing owls that may be present within or adjacent to work activities. Occupied burrows will be avoided by the Program Renewal.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.

- **BMP GEN-15: Prevention of Spread of Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and appropriate protective measures for burrowing owls.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP ANI-3: Burrowing Owl Buffer Zone** specifies that Program Renewal fumigants will not be used within 656 yards around known burrowing owl locations.

In addition, VHP-covered Program Renewal activities will comply with the following condition to avoid and minimize impacts on the burrowing owl:

- **Condition 15. Burrowing Owl** requires habitat surveys and preconstruction surveys for burrowing owls within mapped survey areas, as well as avoidance measures to protect individuals. For VHP-covered activities, this condition will replace the protections outlined in BMP GEN-7 above.

Valley Water will also pay VHP land cover fees, calculated based on Program Renewal impacts to land cover types, for VHP-covered activities. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for burrowing owls in Santa Clara County.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With implementation of BMPs, compliance with VHP conditions, and payment of VHP fees, impacts of VHP-covered Program Renewal activities on the VHP-covered burrowing owl and its habitats are less than significant under CEQA, and no mitigation measures are necessary. For VHP-covered activities, Condition 18 of the VHP will replace the protections outlined in BMP GEN-7.

Activities Not Covered under the VHP

With the implementation of BMPs, effects of the Program Renewal on the burrowing owl and its habitat would be minimized. Occupied burrows would be avoided, and the loss of occupied breeding habitat would not occur. Residual effects of non-VHP-covered Program Renewal activities on this species include limited temporary and permanent impacts on suitable nesting and foraging habitat. Because nonbreeding habitats for the burrowing owl are extensively available in the Program Renewal Area vicinity, and implementation of the Program Renewal is not expected to remove or degrade large areas of nonbreeding habitat or high-quality habitat such that the regional population of this species would be impacted,

Program Renewal impacts on nonbreeding habitat for the burrowing owl are considered less than significant under CEQA, and no mitigation measures are necessary.

SUMMARY AND CONCLUSION

The Program Renewal could result in impacts on breeding and nonbreeding burrowing owls and their habitats. As the availability of grassland habitat used for nesting in the Program Renewal Area continues to dwindle because of development, the South Bay breeding population of burrowing owls faces extirpation caused by lack of sufficient suitable nesting and breeding-season foraging habitat and isolation from other populations and habitat areas. Therefore, impacts to individual burrowing owls (at any time of year) and occupied breeding habitats resulting from the Program Renewal that result in a substantial (i.e., population-level) effect would contribute to the broader-scale decline in regional burrowing owl populations, and would be considered significant under CEQA. Because nonbreeding habitats for the burrowing owl are extensively available in the Program Renewal Area vicinity, Program Renewal impacts on nonbreeding habitat for the burrowing owl are considered less than significant under CEQA. No mitigation measures are necessary.

With the implementation of BMPs, compliance with VHP conditions, and payment of VHP fees, impacts of VHP-covered Program Renewal activities on the burrowing owl and its habitat are less than significant under CEQA, and no mitigation measures are necessary.

With the implementation of BMPs, effects of the Program Renewal on individual burrowing owls and their habitat would be avoided and minimized. No loss of occupied nesting habitat or disturbance of breeding or nonbreeding individuals would occur under the Program Renewal, as occupied burrows would be avoided. Residual effects of non-VHP-covered Program Renewal activities on this species include limited temporary and permanent impacts on suitable (unoccupied) nesting and foraging habitat. Because habitats for the burrowing owl are extensively available in the Program Renewal Area vicinity, and implementation of the Program Renewal is not expected to remove or degrade large areas of habitat or high-quality habitat such that the regional population of this species would be impacted, Program Renewal impacts on habitat for the burrowing owl are considered less than significant under CEQA. No mitigation measures are necessary.

Impact BIO-1S: Impacts on the Golden Eagle and Bald Eagle (Less than Significant)

IMPACT ASSESSMENT

The golden eagle, a state fully protected species, nests in small numbers along the edges of the Santa Clara Valley within the Program Renewal Area, and more widely in the foothills of the Diablo Range and Santa Cruz Mountains. Breeding and nonbreeding individuals forage regularly on the periphery of the Program Renewal Area where areas of natural habitat occur adjacent to much larger expanses of open habitat.

The bald eagle, a state endangered and fully protected species, nests in Santa Clara County in more than 10 locations, and numbers have been increasing in recent years. Small numbers also occur as nonbreeding visitors, typically at reservoirs on either side of the Santa Clara Valley but occasionally in Coyote Valley as well.

As described under “Impacts on Common and Special-Status Fish and Wildlife” above, maintenance activities may result in direct and indirect effects on birds in the Program

Renewal Area due to direct and indirect disturbance of individuals and temporary or permanent impacts on suitable habitat. Maintenance activities are not expected to result in the loss of nesting sites for either of these two eagle species; however, in the absence of BMPs, activities causing a substantial increase in noise or visual disturbance near active nest locations could result in nest abandonment, and possibly the loss of eggs or young as a result. Such activities may also disturb roosting and foraging individuals, which would likely move out of the area. Due to the sensitivity of these species and the small numbers of pairs that breed in the Program Renewal Area, the loss of individual eagles and/or the abandonment of a nesting territory due to disturbance of nest locations that result in a substantial (i.e., population-level) effect would be considered significant under CEQA. However, the disturbance of foraging individuals would be negligible.

Small mammal control may reduce prey availability for golden eagles, but such effects would be localized, and because of the low numbers of eagles that forage in Program Renewal impact areas such activities are not expected to result in substantial changes in prey availability that would affect golden eagle populations. Program Renewal impacts on fish would similarly have very few effects, if any, on bald eagle populations because these birds forage very little, if at all, along creeks in the Program Renewal Area, and instead forage primarily at reservoirs.

The introduction of nonnative vegetation would degrade suitable habitat for bald and golden eagles in the Program Renewal Area. Adverse effects on water quality and fish, including mercury mobilization, may also reduce the suitability of foraging habitat for bald eagles. However, because gold eagles and bald eagles only forage occasionally within Program Renewal Areas, such impacts would be extremely limited and are considered less than significant under CEQA.

Based on the scarcity of breeding individuals in the Program Renewal Area, bald and golden eagles are expected to forage only very infrequently and within a small subset of open habitats in Program Renewal work areas. Even nonbreeding individuals do not frequently forage in Program Renewal work areas. Nevertheless, because these species forage in open habitats (as opposed to dense riparian areas), maintenance activities would help to maintain suitable foraging habitat for bald and golden eagles within work areas, to the extent that eagles might use the Program Renewal Area at all. Further, the majority of any Program Renewal impacts on foraging habitat for bald and golden eagles would be temporary, as disturbed areas will typically restore to existing conditions or be revegetated following the work. However, some permanent impacts could occur where activities such as bank stabilization result in modifications to natural areas. Because only very few individual bald and golden eagles are expected to forage in Program Renewal work areas, and would do so infrequently, implementation of the Program Renewal is not expected to reduce foraging habitat for a nesting pair or affect nest productivity. Thus, Program Renewal impacts on habitat for the bald eagle and golden eagle are considered less than significant under CEQA.

Applicable Best Management Practices and VHP Conditions

Valley Water will implement a number of BMPs to protect biological resources in the Program Renewal Area, including following BMPs to reduce impacts on the golden eagle and bald eagle:

- **BMP GEN-3: Avoid Exposing Soils with High Mercury Levels** will minimize the exposure of soils containing mercury in portions of the Guadalupe River watershed affected by historic mercury mining.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread of Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-20: Hazard Tree Removal** will ensure that no tree known to be occupied by a bald eagle or golden eagle nest that was active within the prior five years would be removed under the Program Renewal.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and appropriate protective measures for bald eagles and golden eagles.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of the bald eagle and golden eagle within the Program Renewal Area, as these species are not covered under the VHP. Nevertheless, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on the bald eagle and golden eagle and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on the bald eagle and golden eagle and their habitats in the Program Renewal Area:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on state and federally listed species as well as fully protected species, including the bald eagle and golden eagle.
- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.

- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts in the Program Renewal Area; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management that would benefit a variety of native species, including bald and golden eagles.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved, although neither eagle species would be covered by the VHP. With implementation of BMPs to avoid the loss or disturbance of active nests of these species as well as the removal of trees known to be occupied by an active bald or golden eagle nest within the prior three years, impacts of VHP-covered Program Renewal activities on individual bald eagles and golden eagles are less than significant under CEQA. No mitigation measures are necessary.

Residual effects of VHP-covered Program Renewal activities on bald eagles and golden eagles include temporary and permanent impacts on suitable nesting and foraging habitat, as well as the indirect disturbance of foraging individuals by maintenance personnel and equipment. As discussed above, these impacts would be less than significant under CEQA. Because only very few individuals are expected to forage in Program Renewal work areas, and would do so infrequently, implementation of the Program Renewal is not expected to remove or degrade large areas of habitat such that the regional populations of these species would be impacted. Thus, Program Renewal impacts on habitat for the bald eagle and golden eagle are considered less than significant under CEQA, and no mitigation measures are necessary. Implementation of BMPs and compliance with VHP conditions will further reduce VHP-covered Program Renewal impacts on habitats for these species.

In addition, Valley Water will pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. The Program Renewal's contribution to the Habitat Agency's reserve system via the payment of VHP land cover fees is expected to benefit the bald eagle and golden eagle, which are known to nest and occur in existing Habitat Agency reserves. Because golden eagles make greater use of the upland habitats that are targeted by the VHP, whereas bald eagles would use the reserves for occasional nesting and limited foraging, Habitat Agency reserves are expected to have proportionally greater benefit to golden eagles compared to bald eagles. As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly "covered species" under the VHP. This conclusion is supported based on the potential suitability of reserve habitat for nesting and foraging bald eagles and golden eagles. Thus, payment of VHP fees would reduce impacts on habitat for the bald eagle and golden eagle.

Activities Not Covered under the VHP

Non-VHP-covered maintenance activities located throughout the Program Renewal Area can result in adverse effects on the bald eagle and golden eagle, as well as nesting and foraging habitat for these species. With implementation of BMPs to avoid the loss or disturbance of active nests, or the removal of trees known to be occupied by an active bald or golden eagle nest within the prior three years, impacts of non-VHP-covered Program Renewal activities on individual bald eagles and golden eagles are less than significant under CEQA. No mitigation measures are necessary.

Residual effects of non-VHP-covered Program Renewal activities on bald eagles and golden eagles include temporary and permanent impacts on suitable nesting and foraging habitat, as well as the indirect disturbance of foraging individuals by maintenance personnel and equipment. As discussed above, these impacts would be less than significant under CEQA. Because only very few individuals are expected to forage in Program Renewal work areas, and would do so infrequently, implementation of the Program Renewal is not expected to remove or degrade large areas of habitat such that the regional populations of these species would be impacted. Thus, non-VHP-covered Program Renewal impacts on habitat for the bald eagle and golden eagle are considered less than significant under CEQA, and implementation of BMPs will reduce non-VHP-covered Program Renewal impacts on habitats for these species. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

Program Renewal activities would result in significant impacts on bald eagles and golden eagles due to the loss of individuals if substantial (i.e., population-level) effects occur. For all Program Renewal activities (regardless of VHP coverage), BMPs will avoid the loss or disturbance of active nests of these species as well as the removal of trees known to be occupied by an active nest within the prior three years. Because only very few individuals are expected to forage in Program Renewal work areas, and would do so infrequently, implementation of the Program Renewal (regardless of VHP coverage) is not expected to remove or degrade large areas of habitat such that the regional populations of these species would be impacted. Thus, Program Renewal impacts on habitat for the bald eagle and golden eagle are considered less than significant under CEQA, regardless of VHP coverage. No mitigation measures are necessary.

For all Program Renewal activities (regardless of VHP coverage), implementation of BMPs to reduce habitat impacts would reduce impacts on habitats for bald eagles and golden eagles. For VHP-covered activities, compliance with applicable VHP conditions and payment of all VHP impact fees would further reduce impacts on habitats for these species.

Impact BIO-1T: Impacts on the Yellow Warbler (Less than Significant with Mitigation)

IMPACT ASSESSMENT

The yellow warbler, a California species of special concern, is a widespread but uncommon breeder in riparian habitats throughout the Program Renewal Area. The species breeds in very low numbers along the lower reaches of South Bay streams, being somewhat more common in the upper reaches of the cottonwood/willow-dominated zone and occasionally in riparian habitats dominated by sycamores, alders, and other species as well. In southern Santa Clara County, yellow warblers have been recorded nesting in riparian habitat along

Llagas, Uvas/Carnadero, and Pacheco Creeks, as well as along the Pajaro River. Yellow warblers from populations elsewhere in North America are abundant migrants throughout the Program Renewal Area during spring and fall.

As discussed under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on birds in the Program Renewal Area due to direct and indirect disturbance and temporary or permanent impacts on suitable habitat. In addition, individuals of these species (especially eggs or young in nests) may be killed or injured during maintenance activities due to crushing by construction personnel or equipment. Activities causing a substantial increase in noise or visual disturbance near active nest locations may result in nest abandonment, and possibly the loss of eggs or young as a result. Such activities may also disturb roosting and foraging individuals, which would likely move out of the area. Human disturbance, leading to reduced attendance of nests, could also potentially increase the risk of brood parasitism of yellow warbler nests by brown-headed cowbirds. Due to the rarity of the yellow warbler in the region and the temporal and geographic extent of the Program Renewal (which could affect a relatively high number of individuals over the 10-year period), the loss of individuals of this species due to Program Renewal activities that result in a substantial (i.e., population-level) impact would be considered significant under CEQA.

Maintenance activities within suitable riparian habitat may also result in the temporary and permanent loss or modification of riparian habitat used for nesting by the yellow warbler. The introduction of nonnative vegetation could also degrade riparian habitats used by this species. Maintenance activities that result in the removal or modification of upland vegetation adjacent to riparian habitat may also affect an area's value as foraging habitat for the yellow warbler. Because this species often nests fairly low in trees, removal of the lower limbs of trees ("limbing up") would remove nesting habitat for this species.

Because of the widespread and often patchy nature of high-quality nesting habitat for yellow warblers in the Program Renewal Area, suitable habitat for the yellow warbler is not mapped for this analysis. High-quality nesting habitat for this species consists of riparian woodlands, often with an overstory of mature cottonwoods and sycamores, a midstory of box elder and willow, and a substantial shrub understory (Bousman 2007c). Riparian areas with reduced understory resulting from grazing or disturbance are generally not used for nesting, and riparian corridors lacking open ruderal or herbaceous vegetation along the edges, or with development up to the corridor edge, are often avoided as well. Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within woody riparian habitats in the Program Renewal Area (91 acres), a subset of which provide nesting habitat that is occasionally used by yellow warblers. Individual yellow warblers can forage in vegetated habitats throughout the Program Renewal Area. The majority of estimated Program Renewal impacts to riparian habitat (86 acres, or 95 percent) are expected to be temporary, as disturbed areas will typically be revegetated following maintenance activities. However, some permanent impacts will occur where activities such as bank stabilization and hazard tree removal result in modifications to natural areas. Due to this species' rarity in the region and the potential for maintenance activities to affect a relatively large area of the species' nesting habitat, the loss of riparian habitat providing suitable nesting and foraging habitat for this species may have a substantial impact on local and regional populations of the species and would be considered significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to reduce impacts on the yellow warbler:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as appropriate protective measures for active nests.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of the yellow warbler within the Program Renewal Area, as this species is not covered under the VHP. However, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on riparian habitats used by yellow warblers:

- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management that would benefit a variety of native species, including the yellow warbler.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved, although the yellow warbler would not be a VHP-covered species. With the implementation of Program Renewal BMPs to ensure that active nests of yellow warblers are avoided by maintenance activities, impacts of VHP-covered Program Renewal activities on individual yellow warblers would be effectively avoided and minimized, and these impacts are less than significant under CEQA. Residual effects of VHP-covered Program Renewal activities on individuals include the limited indirect disturbance of foraging individuals by maintenance personnel and equipment. Such impacts would be less than significant under CEQA, and no mitigation measures are necessary.

Due to the rarity of nesting yellow warblers in the region and the potential for maintenance activities to affect a relatively large area of the species' nesting habitat, the loss of riparian habitat providing suitable nesting habitat for this species may have a substantial impact on local and regional populations of the species and would be considered significant under CEQA. Valley Water will pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. The Program Renewal's contribution to the Habitat Agency's reserve system via the payment of VHP land cover fees is expected to benefit the yellow warbler, which is expected to occur in existing Habitat Agency reserves (which target riparian habitats). As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly "covered species" under the VHP. This conclusion is supported for the yellow warbler based on the species' occurrence in riparian habitats throughout Santa Clara County, including those in Habitat Agency reserves. Thus, with the payment of VHP land cover fees and specialty fees for impacts to riparian habitats, effects of the Program Renewal on nesting habitat for the yellow warbler would be less than significant under CEQA. No mitigation measures are necessary.

Activities Not Covered under the VHP

No maintenance activities within tidal portions of the Program Renewal Area will result in adverse effects on the yellow warbler or its habitat, as this species does not occur within tidal habitats in the Program Renewal Area. For other non-VHP-covered maintenance activities, with the implementation of Program Renewal BMPs to ensure that active nests of yellow warblers are avoided by maintenance activities, impacts on individual yellow warblers would

be less than significant under CEQA. Residual effects of non-VHP-covered Program Renewal activities on individuals include the limited indirect disturbance of foraging individuals by maintenance personnel and equipment. Such impacts would be less than significant under CEQA. No mitigation measures are necessary.

Although BMPs would reduce the magnitude and extent of non-VHP-covered Program Renewal impacts on the yellow warbler and its habitats, substantial impacts on this species would remain due to the temporary and permanent loss of nesting habitat. Due to the patchy breeding distribution of this species in Santa Clara County, it is impossible to determine the extent to which Program Renewal activities would impact this species' populations or use of riparian habitat in the Program Renewal Area. Nevertheless, the Program Renewal would result in the loss or modification of large areas of woody riparian habitat used for nesting and adjacent herbaceous streambank vegetation used for foraging by nesting individuals over the 10-year period. Because of the rarity of this species in the region, as well as the limited availability of high-quality nesting habitat in the Program Renewal Area, such impacts would be significant under CEQA.

Mitigation Measure BIO-12, described under Impact BIO-2A below, requires Valley Water to provide compensatory mitigation for impacts to riparian habitats. The riparian planting and restoration Program Renewal would provide high-quality riparian habitat along Valley Water-maintained streams. However, such riparian habitat mitigation may not benefit the yellow warbler if it is located in areas where the species would not breed. Mitigation Measure BIO-10 below would be implemented to reduce Program Renewal impacts on the yellow warbler to a less-than-significant level by restoring habitat suitable for use by this species, thereby ensuring that the Program Renewal does not substantially reduce the number or restrict the range of this rare species.

Mitigation Measure BIO-10: Compensatory Mitigation Impacts on Yellow Warbler Breeding Habitat

For impacts to occupied yellow warbler breeding habitat (i.e., riparian habitat known to have been occupied in recent years by the species) in areas not located in an existing PMA for the activity being performed, Valley Water's implementation of Mitigation Measure BIO-12 will be required to be located in areas where riparian habitat creation, restoration, and preservation will benefit yellow warblers (e.g., in relatively undeveloped reaches of creeks rather than in creeks surrounded closely on both sides by development), such that mitigation according to these measures occurs at a ratio of no less than 1:1 (on an acreage basis). Valley Water will determine whether impacted riparian habitat is suitable for this species on the basis of breeding-season surveys or comparison of habitat conditions to those in known occupied areas.

SUMMARY AND CONCLUSION

Program Renewal activities can result in significant impacts on yellow warblers due to the loss of individuals. For all Program Renewal activities (regardless of VHP coverage), BMPs will avoid the loss or disturbance of active nests of this species. With the implementation of BMPs, impacts on individual yellow warblers are less than significant under CEQA. Residual effects on individuals of this species include the limited indirect disturbance of foraging individuals by maintenance personnel and equipment. Such impacts would be less than significant under CEQA, and no mitigation measures are necessary.

Because foraging habitats for the yellow warbler and are extensively available in the Program Renewal Area, and implementation of the Program Renewal is not expected to remove or degrade large areas of foraging habitat such that regional populations of these species would be impacted, Program Renewal impacts on foraging habitat for the yellow warbler are also considered less than significant under CEQA, regardless of VHP coverage, and no mitigation measures are necessary. Implementation of BMPs and, for VHP-covered activities, compliance with VHP conditions to minimize impacts on riparian habitats would reduce these impacts.

Due to the rarity of nesting yellow warblers in the region and the potential for maintenance activities to affect a relatively large area of the species' nesting habitat, the loss of riparian habitat providing suitable nesting habitat for this species may have a substantial impact on local and regional populations of the species and would be considered significant under CEQA. For VHP-covered activities, Valley Water will pay VHP land cover fees and specialty fees to reduce effects of the Program Renewal on nesting habitat for the yellow warbler to less than significant levels under CEQA. For non-VHP-covered activities, Valley Water will implement Mitigation Measure BIO-10 to provide high-quality riparian habitat along Valley Water-maintained streams and reduce this impact to less than significant levels under CEQA.

Impact BIO-1U: Impacts on the San Francisco Dusky-Footed Woodrat (Less than Significant)

IMPACT ASSESSMENT

The San Francisco dusky-footed woodrat is a California species of special concern that is locally common in undisturbed areas of woodland, scrub, or riparian habitats with dense understory or thick scrub for cover in the Program Renewal Area. This species is known to occur more regularly along less urbanized reaches of a number of streams in the Program Renewal Area, as well as in rural and natural areas on the Valley floor and in the foothills of the Santa Cruz Mountains and the Diablo Range.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in the injury or mortality of dusky-footed woodrats because of equipment use, vehicle traffic, and worker foot traffic, particularly when stick nests are disturbed or removed by those activities. In addition, animal conflict management (e.g., poisoning or trapping) can adversely affect woodrats where they occur. Suitable nesting and foraging habitat and woodrat nests may be directly lost as a result of clearing and grading for bank stabilization, stream access, or vegetation management activities. Vegetation management can also reduce vegetation density and therefore reduce the quality of suitable habitat for woodrats or cause an area to be unsuitable for occupation by this species.

Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within habitats for San Francisco dusky-footed woodrats. Maintenance activities affecting a subset of woody riparian habitat (91 acres), as well as adjacent non-developed uplands (5,318 acres) where woody vegetation and trees are present, could affect nesting habitat for this species. Woodrats can also forage in adjacent herbaceous streambank vegetation (4,888 acres) throughout the Program Renewal Area. The majority of estimated Program Renewal impacts to woodrat habitat are expected to be temporary, as disturbed areas will typically be revegetated following maintenance activities. However, some permanent impacts will occur where activities such as bank stabilization and hazard tree

removal result in modifications to natural areas. Program Renewal impacts on suitable nesting and foraging habitat for the San Francisco dusky-footed woodrat would be considered less than significant under CEQA because this species' habitats are widespread in the Program Renewal Area, and Program Renewal impacts on suitable habitat would not reduce the species' regional populations.

Program Renewal activities could result in the loss of many nests and individuals of this species due to the localized high abundance of woodrats in certain portions of the Program Renewal Area, as well as its relatively broad distribution. A total of 33 woodrat nests were relocated from 2014–2023 under SMP-2; however, all of these nests were relocated as part of the invasive plant management Program Renewal. Nevertheless, for the purpose of the Program Renewal, a conservative estimate of up to 70 woodrat nests requiring relocation is assumed. Indirect impacts may also occur as a result of over-crowding (as individuals move out of work areas to areas that are occupied by conspecifics) and increased risk of predation. Populations may also be fragmented if extensive areas of suitable habitat are cleared. Due to the species' regional abundance and high reproductive capabilities, Program Renewal impacts on dusky-footed woodrats would not have a substantial effect on regional populations. However, woodrats are very important ecologically in that they provide an important prey source for raptors (particularly owls) and for predatory mammals, and their nests also provide habitat for a wide variety of small mammals, reptiles, and amphibians. As a result, the loss of large numbers of woodrats and their nests would be a substantial (i.e., population-level) impact on wildlife communities, and would be considered significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to reduce impacts on the San Francisco dusky-footed woodrat and its habitats:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including riparian habitats) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-17: Protection of the San Francisco Dusky-Footed Woodrat** requires a pre-activity survey prior to work that could result in disturbance of woodrats and their nests, the protection of any individuals found, and relocation of woodrat nests if avoidance is not feasible.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of the San Francisco dusky-footed woodrat.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.

- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of the San Francisco dusky-footed woodrat in the Program Renewal Area, as this species is not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). This species is not expected to be covered under the VHP in the future. However, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on the San Francisco dusky-footed woodrat and its habitats (e.g., by minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on aquatic habitats.

- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 14. Valley Oak and Blue Oak Woodland Avoidance and Minimization** requires projects located on sites supporting substantial stands of valley or blue oak woodland to minimize impacts.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats for the San Francisco dusky-footed woodrat in the Program Renewal Area, including specialty fees for impacts to riparian and wetland habitats; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management that would benefit a variety of native species, including the woodrat.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

With the implementation of Program Renewal BMPs to ensure that woodrat nests are avoided or relocated prior to the start of work activities, impacts of VHP-covered Program Renewal activities on individual San Francisco dusky-footed woodrats would be less than significant under CEQA. Program Renewal impacts on suitable nesting and foraging habitat for the San Francisco dusky-footed woodrat would be considered less than significant under CEQA because this species' habitats are widespread in the Program Renewal Area, and Program Renewal impacts on suitable habitat would not reduce the species' regional populations. The implementation of Program Renewal BMPs to avoid and minimize impacts on suitable habitats would reduce these impacts. No mitigation measures are necessary.

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved, although the San Francisco dusky-footed woodrat would not be a VHP-covered species. Valley Water will pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. The Program Renewal's contribution to the Habitat Agency's reserve system via the payment of VHP land cover fees is expected to benefit the San Francisco dusky-footed woodrat, as this

species is widespread in the Program Renewal Area and suitable habitat for the species is present in existing Habitat Agency reserves. As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly "covered species" under the VHP. This conclusion is supported for the San Francisco dusky-footed woodrat based on the relatively wide distribution of the species in Santa Clara County. Thus, with the payment of VHP land cover fees and specialty fees for impacts to riparian habitats and other land cover types that potentially support this species, effects of the Program Renewal on habitat for the San Francisco dusky-footed woodrat would be reduced

Activities Not Covered under the VHP

No Program Renewal impacts within tidal portions of the Program Renewal Area would result in impacts on the San Francisco dusky-footed woodrat, as this species does not occur in tidal habitats. Other non-VHP-covered Program Renewal activities could result in adverse effects on the San Francisco dusky-footed woodrat and its habitats. With the implementation of Program Renewal BMPs to ensure that woodrat nests or avoided or relocated prior to the start of work activities, impacts of non-VHP-covered Program Renewal activities on individual San Francisco dusky-footed woodrats would be less than significant under CEQA. Program Renewal impacts on suitable nesting and foraging habitat for the San Francisco dusky-footed woodrat would be considered less than significant under CEQA because this species' habitats are widespread in the Program Renewal Area, and Program Renewal impacts on suitable habitat would not reduce the species' regional populations. No mitigation measures are necessary; however, mitigation provided under Mitigation Measure BIO-12 would benefit this species if the mitigation occurs where populations of woodrats are present through enhancement or creation of woody riparian habitat that the species is dependent on.

SUMMARY AND CONCLUSION

Program Renewal activities could result in significant impacts on San Francisco dusky-footed woodrats due to the loss of individuals. For all Program Renewal activities (regardless of VHP coverage), BMPs will avoid the loss or disturbance of active nests of this species. With the implementation of BMPs, impacts on individual San Francisco dusky-footed woodrats are less than significant under CEQA. No mitigation measures are necessary.

Program Renewal impacts on suitable nesting and foraging habitat for the San Francisco dusky-footed woodrat would be considered less than significant under CEQA because this species' habitats are widespread in the Program Renewal Area, and Program Renewal impacts on suitable habitat would not reduce the species' regional populations. For all Program Renewal activities (regardless of VHP coverage), the implementation of Program Renewal BMPs to avoid and minimize impacts on suitable habitats would reduce these impacts. For VHP-covered activities, compliance with applicable VHP conditions and payment of VHP impact fees would further reduce VHP-covered Program Renewal impacts on habitats for San Francisco dusky-footed woodrats. No mitigation measures are necessary.

Impact BIO-1V: Impacts on the Pallid Bat, Townsend's Big-Eared Bat, and Non-Special-Status Bats (Less than Significant with Mitigation)

The pallid bat, the Townsend's big-eared bat, and non-special-status bats are assessed together because these species roost in similar habitats in the Program Renewal Area (i.e., trees and structures), impacts of maintenance activities on these species would be similar,

and impacts on individuals of these species are considered significant under CEQA and would require similar mitigation.

IMPACT ASSESSMENT

The pallid bat (a California species of special concern) occurs sporadically throughout the Program Renewal Area. Maternity colonies have been documented at several locations in the Program Renewal Area. The species may also occur in or near open space or less-developed areas around the periphery of the Valley floor. Maintenance activities could result in direct and indirect effects on active roosts of pallid bats, as there is some (albeit very low) potential for this species to roost in maintenance activity work areas.

The Townsend's big-eared bat (a California species of special concern) is a rare resident in the Program Renewal Area, and there are no known locations of this species on the Santa Clara Valley floor. Roosting colonies are known from United Technologies Corporation Property east of Coyote Ridge near Metcalf Road and at Almaden-Quicksilver County Park. These records indicate the potential for this species to occur in suitable habitat in the Program Renewal Area, possibly near southern Coyote Ridge and northern Anderson Reservoir or in the Guadalupe Mines area. Maternity roosts are not known or expected to occur on the Valley floor. Maintenance activities will not directly remove or modify any trees or structures providing suitable roosting habitat for the Townsend's big-eared bat, and impacts of the Program Renewal on this species are limited to the potential indirect disturbance of nonbreeding roosts supporting small numbers of individuals.

Common bat species such as the Mexican free-tailed bat, big brown bat, Yuma myotis, California myotis, and possibly other species may also roost in trees and structures throughout the Program Renewal Area. Roost types may include maternity and non-maternity roosts, and numbers of roosting individuals may vary from small (e.g., single individuals) to large (e.g., 10–20 individuals or greater).

The Program Renewal includes the removal of trees that could provide roosting sites for bats. Anticipated tree removal impacts over the 10-year Program Renewal are as follows:

- An unlimited number of hazard trees, regardless of size.
- Up to 150 non-hazard trees greater than 12 inches dbh
- Up to 2,000 non-hazard trees less than 12 inches dbh

Table 3.4-5 provides estimates of the extent of tree removal impacts, which include the removal of up to 5 acres of trees greater than 6 inches dbh, and the removal of up to 137 acres of trees and other vegetation less than 6 inches dbh.

When trees containing roosting colonies or individual bats are removed or modified, individual bats can be physically injured or killed, subjected to physiological stress resulting from being disturbed during torpor, or face increased predation because of exposure during daylight. In addition, nursing young may be subjected to disturbance-related abandonment by their mothers. Program Renewal-related disturbance in close proximity to a maternity roost potentially could cause females to abandon their young.

Due to the rarity of pallid bats and Townsend's big-eared bats in the region, impacts resulting in the injury or mortality of one or more individuals (including the abandonment of young

due to disturbance) of these species such that a substantial effect on regional populations occurs would be considered significant under CEQA. Impacts due to the loss of a roost site, either due to direct removal or indirect disturbance that results in abandonment, supporting a small nonbreeding roost of pallid bats or Townsend's big-eared bats, defined as fewer than five individuals, would not be considered significant under CEQA, as such roost sites are widely available in the region. However, the loss of an occupied roost site (including roosts located in trees or nearby structures), either due to direct removal or indirect disturbance that results in abandonment, supporting an active maternity roost of any size, or a nonbreeding roost of five or more individuals, would be considered significant under CEQA because these species are selective about their roost locations, and occupied roosts supporting five or more individuals of these species are uncommon regionally and of high importance to local populations.

For non-special-status bat species, impacts resulting in the injury or mortality (including the abandonment of young due to disturbance) of 10 big brown bats or at least 20 individuals of other non-special-status bats may also have a substantial effect on regional populations and would be significant under CEQA. The direct removal of an occupied roost supporting 10 big brown bats or at least 20 individuals of other non-special-status bats would also be significant under CEQA due to the limited availability of larger roost locations in the Program Renewal Area. The removal of locations supporting smaller roosts would be considered less than significant under CEQA, as such smaller roost locations are much more widely available regionally. The indirect disturbance of a colony of non-special-status roosting bats that does not result in the mortality of individuals would be considered less than significant under CEQA, as bats are expected to be able to use an alternative roost temporarily, and maintenance activities at a given location would be limited in duration, allowing the bats to return and reoccupy the roost once work is complete.

The loss of high-quality roosting sites for bats could result from the removal of large trees (i.e., trees greater than 12 inches dbh), which are more likely to support cavities that could be used by colonies of roosting bats compared to smaller trees. This is especially true for the removal of hazard trees, which if they are old or rotten may be more likely to support large cavities compared to younger, healthier trees. The removal of trees less than 12 inches dbh, including hazard trees, can also potentially result in the loss of roosting sites for bats, although the number of roosting bats potentially supported by cavities and crevices in these smaller trees would be lower. Trees less than 6 inches dbh are less likely to support roosting bats compared to trees greater than 6 inches dbh because they would support fewer suitable cavities (if any), and they are not expected to support more than a few individual roosting bats due to a lack of large, well-developed cavities.

However, the removal of hazard trees would only result in the removal of trees expected to fail imminently, or in the or in the next 5 to 10 years. Thus, these trees would be lost even in the absence of Program Renewal activities. Further, the removal of hazard trees would reduce the potential for the spread of pathogens, which could result in the loss of even more bat roosting habitat and would reduce the potential for an unhealthy tree to kill or damage a bat roost in a nearby tree, which is a beneficial effect. Thus, the primary loss of roosting habitat that would occur as a result of the Program Renewal would be due to the removal non-hazard trees greater than 12 inches dbh. However, such trees supporting unoccupied but potentially suitable roosting sites for bats are widely available in the region, and thus the removal of these trees is considered less than significant under CEQA.

Herbicides used for vegetation management may deplete invertebrate prey for bats in the Program Renewal Area due to the reduction of vegetation that these prey species depend on. Maintenance activities, particularly vegetation management, may degrade habitat for bats, and may maintain habitat in a reduced-quality state so that it supports fewer individuals over the long term. The introduction of nonnative vegetation would also degrade suitable habitat for bats in the Program Renewal Area. However, because of the relatively small amount of foraging habitat for roosting bats that would be affected by the Program Renewal relative to the extent of such habitat that is available in the region, impacts on foraging habitat for these species would be relatively limited, and would be considered less than significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to reduce impacts on roosting bats and their habitats:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including riparian habitats) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-16: Protection of Bats and Bat Colonies** requires a pre-activity survey prior to work within 100 feet of suitable bat habitat, protective measures as recommended by a qualified biologist, and consultation with CDFW if a colony must be removed or physically disturbed.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of roosting bats.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of bats in the Program Renewal Area, as these species are not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). These species are also not expected to be covered under the VHP in the future. However, for VHP-covered activities, compliance with habitat plan conditions will reduce impacts on roosting bats and their habitats (e.g., by minimizing

habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on habitats for roosting bats:

- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 14. Valley Oak and Blue Oak Woodland Avoidance and Minimization** requires projects located on sites supporting substantial stands of valley or blue oak woodland to minimize impacts.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats for roosting bats in the Program Renewal Area; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management that would benefit a variety of native species, including bats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved, although no bats would be covered species under the VHP. Valley Water will implement BMPs to protect active roosts on and within 100 feet of work areas. Residual effects of VHP-covered Program Renewal activities on roosting bats include the removal of occupied roost locations (where avoidance is not feasible), the removal of suitable unoccupied roosting habitat, the removal and modification of foraging habitat, and the beneficial effect of removing unhealthy hazardous trees. However, the loss of an occupied roost, either due to direct removal or indirect disturbance that results in abandonment, supporting a pallid bat maternity colony of any size, a pallid bat nonbreeding roost of five or more individuals, a colony of at least 10 big brown bats, or a colony of at least 20 individuals of other non-special-status bats would be considered significant under CEQA. The indirect disturbance of a Townsend's big-eared bat maternity colony of any size, or a nonbreeding roost of five or more individuals, that results in abandonment would also be considered significant under CEQA. Mitigation Measure BIO-11 below would be implemented to reduce VHP-covered Program Renewal impacts on roosting bats to a less-than-significant level by creating habitat suitable for roosting by these species and monitoring to ensure the roost becomes occupied, thereby ensuring that the Program Renewal does not reduce large occupied roosts in the Program Renewal Area.

Impacts on unoccupied roosting habitat for bats, as well as foraging habitat, would be less than significant under CEQA, and no mitigation measures are necessary. The implementation of Program Renewal BMPs to minimize impacts would reduce this impact. In addition, Valley Water will pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. The Program Renewal's contribution to the Habitat Agency's reserve system via the payment of VHP land cover fees is expected to benefit common and special-status roosting bats, which are expected to roost and forage in existing Habitat Agency reserves. As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly

"covered species" under the VHP. This conclusion is supported for roosting bats based on the presence of suitable oak woodland, riparian, and other high-quality habitats for bat species in Habitat Agency reserves. However, because the management of Habitat Agency reserves does not target providing/increasing occupied roosts, the benefits to bats provided by reserves would primarily consist of providing high-quality foraging opportunities, rather than replacing roosts that may be lost from covered activities. Thus, with the payment of VHP land cover fees for impacts to land cover types that potentially support these species, effects of the Program Renewal on foraging habitat for roosting bats would be reduced.

Mitigation Measure BIO-11: Provide Alternative Bat Roost

If an occupied roost supporting a pallid bat or Townsend's big-eared bat maternity colony of any size, a pallid bat or Townsend's big-eared bat nonbreeding roost of five or more individuals, a colony of at least 10 big brown bats, or a colony of at least 20 individuals of other non-special-status bats is to be removed by the Program Renewal, Valley Water will retain a qualified biologist to design and determine an appropriate location for an alternative roost structure.

The qualified biologist will determine an appropriate location for the alternative roost structure, based on the location of the original roost and habitat conditions in the vicinity. The roost structure will be built to specifications as determined by a qualified biologist, or it may be purchased from an appropriate vendor. The structure will be placed as close to the impacted roost site as feasible. Valley Water will monitor the roost for up to 3 years (or until occupancy is determined, whichever occurs first) to determine use by bats. If by Year 3 bats are not using the structure, a qualified bat biologist, in consultation with the CDFW, will identify alternative roost designs or locations for placement of the roost, and monitoring of the new roost will occur for an additional 3 years (or until occupancy by bats has been verified).

Activities Not Covered under the VHP

Maintenance activities within tidal portions of the Program Renewal Area will not result in adverse effects on roosting bats, as bats do not roost within tidal reaches of the Program Renewal Area. Program Renewal activities within tidal areas may affect foraging habitat for bats; however, due to the widespread availability for foraging habitat for bats (especially in tidal portions of the Program Renewal Area, which are adjacent to expansive marshes), such impacts would be negligible.

Other non-VHP-covered Program Renewal activities can result in adverse effects on roosting bats, as well as roosting and foraging habitat for these species. With the implementation of BMPs, direct and indirect impacts on individuals would be avoided unless the removal or disturbance of a tree or structure in which the bats are roosting cannot be avoided, and impacts on unoccupied roosting habitat as well as foraging habitats would be reduced. Residual effects of non-VHP-covered Program Renewal activities on bats include the removal of occupied roost locations (where avoidance is not feasible), the removal of suitable unoccupied roosting habitat, the removal and modification of foraging habitat, and the beneficial impact of removing unhealthy hazardous trees. As discussed above, impacts on unoccupied roosting habitat for bats, as well as foraging habitat, would be less than significant under CEQA, and no mitigation measures are necessary. However, the loss of an occupied roost, either due to direct removal or indirect disturbance that results in

abandonment, supporting a pallid bat maternity colony of any size, a pallid bat nonbreeding roost of five or more individuals, a colony of at least 10 big brown bats, or a colony of at least 20 individuals of other non-special-status bats would be considered significant under CEQA. The indirect disturbance of a Townsend's big-eared bat maternity colony of any size, or a nonbreeding roost of five or more individuals, that results in abandonment would also be considered significant under CEQA.

Mitigation Measure BIO-11 would be implemented to reduce non-VHP-covered Program Renewal impacts on roosting bats to a less-than-significant level by creating habitat suitable for roosting by these species and monitoring to ensure the roost becomes occupied, thereby ensuring that the Program Renewal does not reduce large, occupied roosts in the Program Renewal Area.

SUMMARY AND CONCLUSION

For all Program Renewal activities (regardless of VHP coverage), with the implementation of BMPs, direct and indirect impacts on individual roosting bats would be avoided unless the removal or disturbance of a tree or structure in which the bats are roosting cannot be avoided. Effects of Program Renewal activities on bats also include the removal of suitable unoccupied roosting habitat, the removal and modification of foraging habitat, and the beneficial impact of removing unhealthy hazardous trees. Impacts on unoccupied roosting habitat for bats, as well as foraging habitat, would be less than significant under CEQA, and no mitigation measures are necessary. However, Program Renewal activities can result in significant impacts on roosting bats due to the loss of an occupied roost, either due to direct removal or indirect disturbance that results in abandonment, supporting a pallid bat maternity colony of any size, a pallid bat nonbreeding roost of five or more individuals, a colony of at least 10 big brown bats, or a colony of at least 20 individuals of other non-special-status bats. The indirect disturbance of a Townsend's big-eared bat maternity colony of any size, or a nonbreeding roost of five or more individuals, that results in abandonment would also be considered significant under CEQA. Mitigation Measure BIO-11 would be implemented to reduce Program Renewal impacts on roosting bats to a less-than-significant level by creating habitat suitable for roosting by these species and monitoring to ensure the roost becomes occupied, thereby ensuring that the Program Renewal does not reduce large, occupied roosts in the Program Renewal Area.

The implementation of Program Renewal BMPs to avoid and minimize impacts on suitable habitat, and (for VHP-covered activities) the payment of VHP land cover fees for impacts to land cover types that potentially support these species, effects of the Program Renewal on foraging habitat for roosting bats would be reduced.

Impact BIO-1W: Impacts on the San Joaquin Kit Fox (Less than Significant)

IMPACT ASSESSMENT

In the Program Renewal Area, the San Joaquin kit fox (state threatened and federally endangered) is expected to occur only as an occasional dispersant in the vicinity of Pacheco Creek and the uppermost reaches of the Pajaro River, upstream from the Llagas Creek confluence. Even in those areas, kit fox occurrence is expected to be extremely infrequent, and at most, very low numbers of individuals would move through those areas during dispersal (e.g., between areas of known breeding activity well outside the Program Renewal Area). No maintenance activities are projected in the portion of Santa Clara County where kit

foxes could occur, and Valley Water has easements in only two limited areas in this part of the county. Thus, the San Joaquin kit fox would not be impacted by projected Program Renewal activities, and very low potential would exist for even unprojected activities to impact this species.

However, some possibility exists that unprojected maintenance activities could occur in areas where kit foxes are present. As discussed under "Impacts on Common and Special-Status Wildlife Species" above, maintenance activities could result in the indirect disturbance of individuals due to the presence of human activity, noise, and equipment, potentially causing individuals to move out of the area or abandon a den; and/or trapping individuals in dens due to compaction by equipment or filling of burrows. Such impacts would be highly unlikely, but significant under CEQA if they result in substantial (i.e., population-level) effects.

Based on the scarcity of individual in the Program Renewal Area, San Joaquin kit foxes are expected to occur only very infrequently and within a small subset of open habitats in Program Renewal work areas, if at all. Maintenance activities would have no impact on high-quality habitat for San Joaquin kit foxes; this species does not make substantial use of habitats in the Program Renewal Area, and Program Renewal work areas are subject to periodic human disturbance. Further, the habitats in the Program Renewal Area that would be used by kit foxes (e.g., grasslands), should they occur there, are widely available regionally, and the loss or modification of small areas of these habitats along streams in the Program Renewal Area would not affect regional kit fox populations. Maintenance activities would reduce vegetative cover for kit foxes that may forage or disperse along streams in the Program Renewal Area; however, kit foxes are expected to make only very limited use of these habitats due to their rarity in the county. Due to these combined factors, Program Renewal impacts on habitat for kit foxes would be less than significant.

Small mammal control may reduce prey availability for kit foxes, but such effects would be localized, and because of the low numbers of kit foxes that forage in Program Renewal impact areas such activities are not expected to result in substantial changes in prey availability that would affect kit fox populations.

Applicable Best Management Practices and VHP Conditions

Valley Water will implement the following BMPs to reduce impacts on the San Joaquin kit fox and its habitats:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-19: Avoidance of Impacts on the San Joaquin Kit Fox** requires pre-activity surveys in areas where the species can potentially occur and the avoidance of active dens. The exclusion of San Joaquin kit foxes from dens may occur with authorization from the USFWS and CDFW, but no injury or mortality of kit foxes would occur, and active maternity dens would be avoided. As stated in the BMP, these measures would be implemented for non-VHP-covered activities only.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of the San Joaquin kit fox.

- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.

In addition, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on the San Joaquin kit fox:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on state and federally listed species as well as fully protected species, including the San Joaquin kit fox.
- **Condition 18. San Joaquin Kit Fox** requires habitat surveys, preconstruction surveys, and avoidance of occupied dens to avoid all injury to or death of kit foxes, and to minimize harm or harassment. For VHP-covered activities, this condition will replace the protections outlined in BMP GEN-19 above.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for San Joaquin kit foxes in Santa Clara County.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With compliance with VHP conditions and payment of VHP fees, impacts of VHP-covered Program Renewal activities on the VHP-covered San Joaquin kit fox and its habitats are less than significant under CEQA, and no mitigation measures are necessary. For VHP-covered activities, Condition 18 of the VHP will replace the protections outlined in BMP GEN-19.

Activities Not Covered under the VHP

No maintenance activities within tidal portions of the Program Renewal Area will result in adverse effects on the San Joaquin kit fox, as this species does not occur within tidal habitats in the Program Renewal Area.

With the implementation of BMPs, effects of the Program Renewal on the San Joaquin kit fox and its habitat would be minimized. Program Renewal activities would avoid active maternity dens, and active non-maternity dens would be avoided to the maximum extent possible. If avoidance is not possible, the exclusion of kit foxes from non-maternity dens could occur with consultation from the CDFW and USFWS. However, the injury or mortality of kit foxes would be avoided. Thus, with the implementation of BMPs, Program Renewal impacts on individuals

are reduced to less than significant levels under CEQA, and no mitigation measures are necessary.

Residual effects of non-VHP-covered Program Renewal activities on this species include temporary and permanent impacts on suitable denning, dispersal, and foraging habitat, as well as the limited indirect disturbance of foraging individuals by maintenance personnel and equipment. Such impacts would be negligible and considered less than significant under CEQA. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

The Program Renewal could result in impacts on breeding and nonbreeding San Joaquin kit foxes and their habitats. With compliance with VHP conditions and payment of VHP fees, impacts of VHP-covered Program Renewal activities on the VHP-covered San Joaquin kit fox are less than significant under CEQA, and no mitigation measures are necessary. For non-VHP-covered activities, with the implementation of BMPs, effects of the Program Renewal on individual San Joaquin kit fox would be effectively minimized, and no injury or mortality of individual kit foxes would occur. Residual effects of non-VHP-covered Program Renewal activities on this species include temporary and permanent impacts on suitable denning, dispersal, and foraging habitat, as well as the limited indirect disturbance of foraging individuals by maintenance personnel and equipment. Such impacts would be negligible and considered less than significant under CEQA. With the implementation of BMPs, and (for VHP-covered activities) compliance with VHP conditions and payment of VHP fees, impacts on habitat for San Joaquin kit foxes are reduced. No mitigation measures are necessary.

Impact BIO-1X: Impacts on the Mountain Lion, American Badger, Ringtail, and Western Red Bat (Less than Significant)

The Central Coast Evolutionarily Significant Unit of the mountain lion, a candidate for listing under CESA, and the American badger, ringtail, and western red bat, which are California species of special concern, are discussed together because Program Renewal impacts on these species would be extremely limited, no BMPs are proposed specifically to reduce impacts on these species, and no mitigation measures are necessary to reduce Program Renewal impacts on these species to less-than-significant levels under CEQA.

IMPACT ASSESSMENT

Mountain lions occur widely and at low densities throughout the Santa Cruz Mountains and Diablo Range in the Program Renewal Area, and individuals occasionally disperse across Valley floor areas. Open lands on the periphery of the Program Renewal Area provide suitable foraging and dispersal habitat for this species, and individuals likely occur in these areas periodically and in low numbers. However, mountain lions are not expected to den or breed along or near Program Renewal Area channels due to periodic human disturbances. Thus, the potential for maintenance activities to affect individuals of this species is extremely low.

The American badger typically occurs in large expanses of annual grasslands, oak woodland savannas, scrublands, and other habitats with stable ground squirrel populations or other fossorial rodents (e.g., gophers). Badgers occur to a lesser extent in agricultural areas, where intensive cultivation inhibits den establishment and reduces prey abundance, but they are known to use these areas for dispersal, and they may den in pastures or fallow fields. In the Program Renewal Area, badgers are known to occur primarily in foothill areas, but they will

periodically disperse across the Valley floor. They are not typically found along riparian or stream edges. Thus, although maintenance activities may occur along the margins of large areas of open habitat, the potential for such activities to disturb a badger or an active badger den would be extremely low.

The status and distribution of the ringtail in the Program Renewal Area is poorly understood. Although this species' strictly nocturnal habits may be at least partially responsible for the lack of information on its distribution in Santa Clara County, it likely is very rare in the Program Renewal Area based on the lack of sightings and the scarcity of roadkill records (e.g., compared to the nocturnal American badger, which is much more frequently detected by roadkills). Ringtails have been recorded in the Program Renewal Area near Lexington Reservoir, near Little Arthur Creek west of Gilroy, and near the confluence of Carnadero Creek and the Pajaro River. Ringtails possibly may be present in small numbers in less developed, wooded areas elsewhere, and ostensibly suitable habitat is present in forested areas at the upper margins of the Program Renewal Area. However, this species likely is scarce throughout the majority of the Program Renewal Area. Thus, the potential for maintenance activities to disturb a ringtail or an active ringtail den would be extremely low.

The western red bat does not breed in the Program Renewal Area, but roosts in the foliage of trees in the Program Renewal Area during winter and migration. This species is strongly associated with intact cottonwood and sycamore valley riparian habitats at low elevations but may roost in trees of many species throughout the Program Renewal Area. Maintenance activities occurring in riparian areas that result in the removal of trees or limbs may result in the disturbance of small numbers of nonbreeding individuals of this species.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on the mountain lion, American badger, ringtail, and western red bat in the Program Renewal Area, as well as foraging and dispersal habitat for all of these species and breeding habitat for the mountain lion, American badger, and ringtail. The physical presence of people and equipment during maintenance activities can result in adverse effects on individual mountain lions, American badgers, ringtails, and western red bats due to the presence of human activity, noise, and equipment, potentially causing individuals to move out of the area or abandon a den (for badgers and ringtails) or roost (for western red bats). Any western red bat that is roosting in a tree to be removed or pruned is expected to flush from the tree before injury or mortality could occur, though bats flushed during the day could suffer increased predation rates, and therefore the Program Renewal may cause the loss of small numbers of individuals. However, very few mountain lions, American badgers, ringtails, and western red bats would be affected, and Program Renewal activities are not expected to occur close enough to breeding dens for mountain lions, badgers, or ringtails to adversely affect reproduction by those species. Therefore, impacts from disturbance of individuals of these species would be less than significant under CEQA.

Small mammal control may reduce prey availability for mountain lions, American badgers, and ringtails in the Program Renewal Area, but such effects would be localized. Herbicides used for vegetation management may similarly deplete invertebrate prey for western red bats and ringtails in the Program Renewal Area due to reducing vegetation that these prey species rely on. Because of the low numbers of mountain lions, badgers, ringtails, and western red bats that forage in Program Renewal impact areas, and because no rodenticides (which could cause secondary poisoning of mountain lions and badgers) will be used by the Program

Renewal, small mammal control and herbicide use conducted under the Program Renewal is not expected to result in substantial changes in prey availability that would affect their regional populations.

Maintenance activities would reduce vegetative cover for the mountain lion, American badger, ringtail, and western red bat along streams in the Program Renewal Area. Table 3.4-5 provides estimates of temporary and permanent impacts of Program Renewal activities within habitats throughout the Program Renewal Area that potentially support these species. However, because the mountain lion, American badger, ringtail, and western red bat make only very limited use of these habitats in the Program Renewal Area, only a fraction of Program Renewal impacts estimated in Table 3.4-5 would affect these species. The introduction of nonnative vegetation would also degrade suitable habitat. In addition, as discussed under Impact BIO-1V above, maintenance activities would remove a large number of trees throughout the Program Renewal Area, which would remove suitable roost locations for the western red bat. However, these activities would have no impact on high-quality habitat for the mountain lion, American badger, ringtail, and western red bat, as they are expected to make only very limited use of habitats in the Program Renewal Area due to their rarity in the county. Further, the habitats in the Program Renewal Area that would be used by these species are widely available regionally, and the loss or modification of suitable habitats within maintenance activity work areas would not affect regional populations. Due to these combined factors, Program Renewal impacts on habitat for these species would be less than significant under CEQA. Impacts resulting in the loss of an active roost of western red bats would also be considered less than significant because this species roosts widely and only in small numbers in the Program Renewal Area, and because individuals roost solitarily so that no large roosts would be affected.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

No BMPs are proposed specifically to reduce impacts on individual mountain lions, American badgers, ringtails, or western red bats as a result of the Program Renewal. However, Valley Water will implement the following BMPs to minimize impacts on suitable habitat for these species in the Program Renewal Area:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including riparian habitats) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread of Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.

- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of the mountain lion, American badger, and western red bat in the Program Renewal Area, as these species are not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). The mountain lion and American badger may be covered under the VHP in the future, and one or more of these species may be formally covered by the VHP once the amendment is approved. At that time, Valley Water would comply with any VHP conditions specific to these species. The ringtail and western red bat are not expected to be covered under the VHP in the future.

For VHP-covered activities, compliance with habitat plan conditions will reduce impacts on the mountain lion, American badger, ringtail, and western red bat and their habitats (e.g., by minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on habitats for these species:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on fully protected species, including the ringtail.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 14. Valley Oak and Blue Oak Woodland Avoidance and Minimization** requires projects located on sites supporting substantial stands of valley or blue oak woodland to minimize impacts.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species, including the mountain lion, American badger, ringtail, and western red bat, in Santa Clara County.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

VHP-covered Program Renewal activities may result in the disturbance of small numbers of foraging mountain lions; no impacts to denning or breeding mountain lions would occur. There is also a low potential for maintenance activities to result in the disturbance of an active den of ringtails or American badgers. In addition, the removal of trees could disturb a small number of nonbreeding western red bats. Because extremely low numbers of mountain lions, American badgers, ringtails, and western red bats would be affected relative to their regional populations, these impacts would be less than significant under CEQA, and no mitigation measures are necessary.

VHP-covered Program Renewal activities would have no impact on high-quality habitat for the mountain lion, American badger, ringtail, or western red bat, as these species make only very limited use of habitats in the Program Renewal Area due to their rarity in the county and because most Program Renewal activities are focused in developed areas where these species occur infrequently. Further, the habitats in the Program Renewal Area that would be used by these species are widely available regionally, and the loss or modification of suitable habitats within maintenance activity work areas would not affect regional habitat availability or populations. Due to these combined factors, Program Renewal impacts on habitat for these species would be less than significant under CEQA. Impacts resulting in the loss of an active roost of western red bats would also be considered less than significant because this species roosts widely and only in small numbers in the Program Renewal Area, and individuals roost solitarily so that no large roosts would be affected. No mitigation measures are necessary. The implementation of Program Renewal BMPs to minimize impacts on habitats for the mountain lion, American badger, ringtail, and western red bat would reduce impacts on habitats for these species.

VHP-covered Program Renewal activities would pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. The Program Renewal's contribution to the Habitat Agency's reserve system via the payment of VHP land cover fees is expected to benefit mountain lions, American badgers, ringtails, and western red bats, as suitable habitat is present in existing Habitat Agency reserves. As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly "covered species" under the VHP. This conclusion is supported for mountain lions, American badgers, ringtails, and western red bats based on the presence of suitable habitats for these species in Habitat Agency reserves. Thus, the payment of VHP fees for VHP-covered Program Renewal activities will reduce impacts on the mountain lion, American badger, and western red bat. Further, if the mountain lion and American badger are added to the VHP as covered species, the VHP's conservation Program Renewal would include measures specifically intended to benefit these species.

Activities Not Covered Under the VHP

No Program Renewal impacts within tidal portions of the Program Renewal Area will result in adverse effects on the mountain lion, American badger, ringtail, or western red bat, as these species do not occur within tidal habitats.

Other non-VHP-covered Program Renewal activities could result in adverse effects on small numbers of individual mountain lions, American badgers, ringtails, and/or western red bats, as well as suitable habitat for these species. Non-VHP-covered Program Renewal activities may result in the disturbance of small numbers of foraging mountain lions; no impacts to denning or breeding mountain lions would occur. There is also a low potential for maintenance activities to result in the disturbance of an active den of ringtails or American badgers. In addition, the removal of trees could disturb a small number of nonbreeding western red bats. Because very few mountain lions, American badgers, ringtails, and western red bats would be affected relative to their regional populations, and because most Program Renewal activities are focused in developed areas where these species occur infrequently,

these impacts would be less than significant under CEQA, and no mitigation measures are necessary.

Non-VHP-covered Program Renewal activities would have no impact on high-quality habitat for the mountain lion, American badger, ringtail, or western red bat, as these species are expected to make only very limited use of habitats in the Program Renewal Area due to their rarity in the county. Further, the habitats in the Program Renewal Area that would be used by these species are widely available regionally, and the loss or modification of suitable habitats within maintenance activity work areas would not affect regional habitat availability or populations. Due to these combined factors, Program Renewal impacts on habitat for these species would be less than significant under CEQA. Impacts resulting in the loss of an active roost of western red bats would also be considered less than significant because this species roosts widely and only in small numbers in the Program Renewal Area, and individuals roost solitarily so that no large roosts would be affected. The implementation of Program Renewal BMPs to minimize impacts on habitats for the mountain lion, American badger, ringtail, and western red bat would reduce impacts on habitats for these species. Mo mitigation measures are necessary; however, mitigation provided under Mitigation Measure BIO-12 would also benefit the ringtail and/or western red bat if the mitigation occurs in areas where these species are present.

SUMMARY AND CONCLUSION

Maintenance activities could affect the mountain lion, American badger, ringtail, western red bat, and their habitat within portions of the Program Renewal Area where these species occur. Due to the limited number of individual mountain lions, American badgers, ringtail, or western red bats that would be affected by the Program Renewal, as well as the limited extent of Program Renewal-related habitat impacts that would occur relative to available habitats for these species in the region, Program Renewal activities would not result in any substantial (i.e., population-level) impacts on these species or their habitats. Therefore, VHP-covered and non-VHP-covered Program Renewal impacts on these species and their habitats would be less than significant under CEQA. The implementation of Program Renewal BMPs to minimize impacts on habitats for the mountain lion, American badger, ringtail, and western red bat would reduce impacts on habitats for these species. Mo mitigation measures are necessary; however, mitigation provided under Mitigation Measure BIO-12 would also benefit the ringtail and/or western red bat if the mitigation occurs in areas where these species are present.

Impact BIO-1Y: Impacts on the Pacific Harbor Seal (Less than Significant)

The Pacific harbor seal is protected by the Marine Mammal Protection Act. Therefore, the potential effects of the Program Renewal on this species are evaluated.

IMPACT ASSESSMENT

Harbor seals occur in the Program Renewal Area in open waters of the San Francisco Bay, and individuals occasionally wander up tidal sloughs where maintenance activities are projected to occur. Groups of harbor seals haul out at sites that typically consist of mudflats located far from areas used regularly by humans, and near deeper water where seals forage. Haul-out sites are used by seals for resting and pupping (giving birth). A known, primary haul-out site for harbor seals in the South Bay is present north of the Program Renewal Area at Mowry Slough in Fremont.

Projected sediment removal, instream vegetation management, and aquatic herbicide application activities, as well as unprojected activities along lower portions of creeks in the Program Renewal Area that harbor seals could access (e.g., Stevens Creek, the Guadalupe River, and Coyote Creek) may disturb occasional basking or foraging harbor seals. However, no Program Renewal activities are expected to occur near known pupping or major haul-out sites. Thus, impacts to individuals are expected to be limited and temporary, and maintenance activity-related disturbances would not lead to the separation of pups from nursing mothers or the abandonment of traditional haul-out sites. Thus, this impact would be considered less than significant.

Sedimentation, contaminated runoff, or hazardous material spills from maintenance activities may result in the temporary degradation of aquatic habitat for harbor seals, although such effects likely would be negligible in the context of all the anthropogenic factors adversely affecting this species and its habitats. Mercury mobilization and bioconcentration in fish on which harbor seals prey potentially could have a greater risk of impacting the health of harbor seals, although Program Renewal activities would increase mercury levels only incrementally in the prey that already were consumed by these seals. Due to the limited nature of these impacts, they are considered less than significant under CEQA.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

No BMPs are specifically proposed to reduce impacts on individual harbor seals as a result of the Program Renewal. However, Valley Water will implement the following BMPs to minimize impacts on suitable habitat for harbor seals in the Program Renewal Area:

- **BMP GEN-3: Avoid Exposing Soils with High Mercury Levels** will minimize the exposure of soils containing mercury in portions of the Guadalupe River watershed affected by historic mercury mining.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.

- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-41: Dewatering in Tidal Work Areas** provides procedures for diverting water around work areas and excluding fish from work areas in tidal locations to avoid and minimize impacts to water quality and special-status fish.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within nontidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of harbor seals within the Program Renewal Area, as this species is not covered under the VHP and the VHP permit area does not (and will not in the future) extend into tidal areas where this species occurs. Because the VHP permit area does not extend into this species' habitats, compliance with habitat plan conditions and the payment of VHP land cover fees and specialty fees are not expected to reduce impacts of the Program Renewal on this species and its habitats.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

No VHP-covered activities will affect the harbor seal, as the VHP permit area does not (and will not in the future) extend into tidal habitats.

Activities Not Covered under the VHP

Non-VHP-covered Program Renewal activities occurring in tidal habitats may disturb occasional basking or foraging harbor seals. However, impacts to individuals are expected to be limited and temporary, and would be considered less than significant under CEQA. Sedimentation, contaminated runoff, or hazardous material spills from maintenance activities may result in the temporary degradation of aquatic habitat for harbor seals, and mercury mobilization and bioconcentration in fish on which harbor seals prey potentially could impact the health. However, these impacts would be extremely limited, and less than significant under CEQA. The implementation of Program Renewal BMPs to minimize impacts on habitats, including avoiding exposing soils with high levels of mercury, would reduce these impacts. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

Program Renewal impacts to individual harbor seals are expected to be limited and temporary, and maintenance activity-related disturbances would not lead to the separation of pups from nursing mothers or the abandonment of traditional haul-out sites. Thus, this impact would be considered less than significant. Indirect impacts to water quality would also have a limited nature and would be considered less than significant under CEQA. No mitigation measures are necessary.

No VHP-covered activities will affect the harbor seal, as the VHP permit area does not (and will not in the future) extend into tidal habitats. The implementation of Program Renewal BMPs to minimize impacts on habitats, including avoiding exposing soils with high levels of mercury, would reduce impacts of non-VHP-covered activities on the harbor seal and its habitats. No mitigation measures are necessary.

Impact BIO-1Z: Impacts on Non-Special-Status Animal Species (Less than Significant with Mitigation)

Non-special-status fish, amphibian, reptile, mammal, and bird species are discussed together because they occur throughout the Program Renewal Areas, and mitigation measures to reduce impacts of the Program Renewal to less-than-significant levels under CEQA are similar. Although these species are not "special-status", they are discussed here because the large scope of the Program Renewal will affect entire communities of wetland and riparian-associated animals. Rather than discuss impacts on these communities under Impacts BIO-2 and BIO-3, we discuss them here to simplify those sections.

IMPACT ASSESSMENT

As discussed in Section 3.4.3, "Environmental Setting," the rivers and creeks of Santa Clara County are home to over 20 native species of fish (Valley Water 1995, Leidy 2007, Valley Water 2008, 2008b, Smith 2019, Valley Water 2019, 2020, 2021, Valley Water unpublished data), including the special-status species discussed under Impacts BIO-1D to BIO-1I above

as well as many non-special-status species such as the prickly sculpin, Sacramento sucker, and threespine stickleback. Likewise, several species of non-special-status amphibians, such as the western toad, California newt, and Pacific chorus frog, use creeks throughout the Program Renewal Area as breeding, foraging, and dispersal habitat. The Program Renewal would impact approximately 114 acres of aquatic habitats and 444 acres of vegetated wetlands that support these species; as well as 91 acres of woody riparian habitat that provide shade, contribute to in-stream habitat complexity, and provide foraging habitats and refugia for amphibians; and 4,888 acres of herbaceous streambank habitat that provides foraging opportunities and refugia for amphibians (Table 3.4-5). Several species of non-special-status reptiles, such as the gopher snake and western fence lizard, also use habitats along creeks throughout the Program Renewal Area as breeding, foraging, and dispersal habitat, although the majority of these species (with the exception of garter snakes, which forage in aquatic habitats) occur outside of aquatic habitats. The Program Renewal would impact approximately 4,888 acres of herbaceous streambank habitats, 91 acres of woody riparian habitats, and 5,318 acres of other non-developed uplands that provides habitat for these species (Table 3.4-5).

Species of non-special-status mammals such as rodents, rabbits, raccoons, skunks, and bobcats (non-special-status bats are discussed separately under Impact BIO-1V above) also breed, forage, and disperse in upland habitats along Program Renewal Area channels. The Program Renewal would impact approximately 4,888 acres of herbaceous streambank vegetation, 91 acres of woody riparian vegetation, and 5,318 acres of non-developed uplands that would provide suitable habitat for these species (Table 3.4-5).

Finally, numerous species of birds, especially riparian and wetland-associated birds, nest, forage, and disperse in riparian, wetland, and upland vegetation along these channels. The Program Renewal would impact approximately 144 acres of aquatic habitat for waterbirds such as ducks; 444 acres of vegetated wetlands that provide habitat for wetland-associated birds such as marsh wrens and American coots; 4,888 acres of herbaceous streambank vegetation that provide habitat for species such as red-winged blackbirds; 91 acres of woody riparian vegetation that provide habitat for species such as the western flycatcher; and 5,318 acres of non-developed upland habitats that provide habitat for a variety of species, depending on the vegetation community present.

As described under “Impacts on Common and Special-Status Fish and Wildlife” above, maintenance activities may result in direct and indirect effects on non-special-status fish, amphibians, reptiles, mammals, and birds in the Program Renewal Area, as well as breeding, foraging, and dispersal habitat for these species. Program Renewal activities could affect the survival, reproduction, and/or growth of these species where they breed in the Program Renewal Area. In addition, the physical presence of people and equipment during maintenance activities can result in adverse effects on individuals due to direct and indirect disturbance, including the loss of individuals. Maintenance activities would also reduce vegetative cover for these species along streams in the Program Renewal Area. In addition, vegetation management activities would include the application of herbicides, as discussed under “Impacts on Common and Special-Status Fish and Wildlife” above. Herbicides could result in adverse effects on non-special status fish and amphibians, as discussed for special-status species under Impacts BIO-1D–1J above, including direct effects on the survival, reproduction, and growth of individuals, as well as indirect effects including reductions in available prey and habitat modification.

Valley Water studies have found that wetland vegetation often quickly re-establishes following sediment removal activities; therefore, any impacts on such habitats would be of short duration (i.e., 2–3 years). In addition, while frequent, repetitive sediment removal or vegetation management in freshwater areas would result in a long-term reduction of this habitat; less frequent, though periodic, sediment removal and herbicide application prevent succession that would ultimately convert emergent vegetation to tall woody riparian habitat. Therefore, many Program Renewal activities are expected help to maintain emergent vegetation in the Program Renewal Area over the long term, at the expense of 2–3 years of habitat loss immediately following sediment removal or vegetation management. Due to these combined factors, impacts of maintenance activities on suitable habitat for non-special-status species that utilize emergent vegetation, such as Pacific tree frogs, song sparrows, and marsh wrens, are less than significant under CEQA.

Other non-special-status fish and amphibians that would be impacted by the Program Renewal are relatively abundant and widespread in the region. As a result, any one maintenance activity would not result in a substantial effect on regional populations of these species or their habitats. However, maintenance activities could impact relatively large numbers of these species over the entire geographic and temporal scope of the 10-year Program Renewal, which would ultimately result in modifications to extensive areas of suitable habitat, and potentially the loss and disturbance of large numbers of individuals. Due to the geographic and temporal extent of Program Renewal impacts on individuals, they would be considered significant under CEQA. In addition, the loss of woody riparian and wetland habitats that support non-special-status fish and wildlife species would be significant under CEQA due to the high value these habitats provide to fish and wildlife communities. However, herbaceous streambank and upland vegetation, including communities dominated by natives and nonnatives, regenerates quickly and, compared to woody riparian vegetation dominated by trees and shrubs, provides relatively low habitat functions and values for wildlife. In addition, these habitats are extensively available in the Program Renewal Area vicinity, and Program Renewal impacts are not expected to permanently remove or degrade these areas such that populations of non-special-status wildlife species cannot re-establish following the maintenance work. Therefore, Program Renewal impacts on herbaceous streambank and upland vegetation and associated non-special-status wildlife are less than significant under CEQA.

Applicable Best Management Practices and VHP Conditions

Valley Water will implement the following BMPs to avoid and minimize impacts on the non-special-status fish, amphibians, reptiles, mammals, and birds and their habitats in the Program Renewal Area:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities to avoid and minimize times of year when native fish and amphibians are most likely to be present.
- **BMP GEN-2: Instream Herbicide Application** ensures that in-stream herbicide application is limited to the period from June 15 to October 15, or until significant rainfall is forecasted or observed, when non-special-status fish and amphibians are less likely to be present and provides additional measures to ensure that effects of instream herbicide application on aquatic wildlife are minimized.

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities,** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-18: Salvage Native Aquatic Vertebrates from Dewatered Channels** requires implementation of a fish and native aquatic vertebrate relocation plan to ensure that fish and native aquatic vertebrates are not stranded during localized dewatering.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.

- **BMPs GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at nontidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-41: Dewatering in Tidal Work Areas** provides procedures for diverting water around work areas in tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within nontidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low-ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.
- **BMP BANK-2: Concrete Use near Waterways** provides measures to ensure that fresh concrete is isolated until it no longer poses a threat to water quality.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions specifically focus on protection of non-special-status invertebrate, amphibian, reptile, or mammal species within the Program Renewal Area, as these species are not covered under the VHP or listed as fully protected in California (such that VHP Condition 1 would apply). These species are also not expected to be covered under the VHP in the future. Nesting birds do receive protection under the VHP via Condition 1, which prohibits impacts on nesting, protected bird species.

For VHP-covered activities, compliance with habitat plan conditions will reduce impacts on non-special-status species and their habitats (e.g., by protecting water quality, preventing erosion, and minimizing habitat impacts). Specifically, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on habitats:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on legally protected species.
- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.

- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.
- **Condition 14. Valley Oak and Blue Oak Woodland Avoidance and Minimization** requires projects located on sites supporting substantial stands of valley or blue oak woodland to minimize impacts.

Further, Valley Water would pay VHP impact fees that would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management of habitats used by a wide variety of native non-special-status fish, amphibian, reptile, mammal, and bird species.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

VHP-covered activities could result in the injury or mortality of non-special-status fish, amphibians, reptiles, mammals, and birds in the Program Renewal Area. As discussed above, impacts to species that utilize emergent wetland, herbaceous streambank, and herbaceous upland habitats would be less than significant under CEQA. However, Program Renewal impacts on non-special-status species in other habitats would be significant under CEQA, especially within wetland and riparian habitats, as these areas support high biodiversity. Valley Water will implement BMPs to avoid and minimize the loss of individual non-special-status aquatic vertebrates (including native fish and amphibians that are present when dewatering occurs) by relocating them during dewatering. Valley Water will also implement BMPs to avoid and minimize impacts on active nests of native birds in the Program Renewal Area. With the implementation of these BMPs, impacts due to the loss of individual native fish and birds would be less than significant under CEQA. However, the injury or mortality of relatively large numbers of non-special-status amphibians (outside of dewatering areas), reptiles, and mammals would still potentially occur as a result of maintenance activities. Due to the potential impacts to large numbers of non-special-status fish and wildlife species over the entire geographic and temporal scope of the 10-year Program Renewal, these impacts would be significant under CEQA. No mitigation measures are necessary.

VHP-covered activities would also result in the loss of habitats for non-special-status fish, amphibians, reptiles, mammals, and birds in the Program Renewal Area. As discussed above, impacts to emergent wetland and herbaceous upland habitats that are maintained in their existing conditions by maintenance activities would be less than significant under CEQA. However, Program Renewal impacts to other habitats, especially wetland and riparian habitats, would be significant under CEQA. Valley Water will implement BMPs to avoid and minimize the loss of these habitats in the Program Renewal Area. Nevertheless, maintenance activities could result in impacts to extensive areas of suitable habitat over the 10-year Program Renewal. As discussed above, due to the geographic and temporal extent of these impacts, such impacts would be considered significant under CEQA, and no mitigation measures are necessary.

Valley Water would pay VHP fees for VHP-covered impacts on natural land cover types that provide habitat for non-special-status fish, amphibians, reptiles, mammals, and birds in the Program Renewal Area; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats. The Program Renewal's contribution to the Habitat Agency's reserve system would benefit these species, which are widespread in the Program Renewal Area and occur in existing Habitat Agency reserves. As discussed in the EIR for the VHP (USFWS et al. 2012), as an NCCP the VHP's reserve system will benefit whole communities of plant and animal species in Santa Clara County in addition to the species that are explicitly "covered species" under the VHP. This conclusion is supported for the non-special-status fish, amphibians, reptiles, mammals, and birds that would be impacted by the Program Renewal based on the relatively wide distribution of these species in Santa Clara County as well as the presence of populations of these species within the reserve system. Therefore, with the payment of VHP fees and compliance with the VHP's conditions, the VHP is expected to have a net benefit on the conservation of these species, and Program Renewal impacts on non-special-status fish, amphibians, reptiles, mammals, and birds as well as woody riparian and wetland habitats would be reduced to less than significant levels under CEQA. The implementation of Mitigation Measures BIO-1, BIO-3, BIO-6, BIO-7, BIO-8, BIO-9, BIO-11, and BIO-12 would reduce VHP-covered Program Renewal impacts on these species by providing compensatory mitigation for various special-status species and sensitive habitats that would benefit non-special-status species that occur in similar habitats.

Activities Not Covered under the VHP

Non-VHP-covered activities could result in the injury or mortality of non-special-status fish, amphibians, reptiles, mammals, and birds in the Program Renewal Area. As discussed above, impacts to species that utilize emergent wetland, herbaceous streambank, and herbaceous upland habitats would be less than significant under CEQA. However, Program Renewal impacts on non-special-status species in other habitats would be significant under CEQA, especially within wetland and riparian habitats, as these areas support high biodiversity. Valley Water will implement BMPs to avoid and minimize the loss of individual non-special-status aquatic vertebrates (including native fish and amphibians that are present when dewatering occurs) by relocating them during dewatering. Valley Water will also implement BMPs to avoid impacts on active nests of native birds in the Program Renewal Area. With the implementation of these BMPs, impacts due to the loss of individual native fish and birds would be less than significant under CEQA, and no mitigation measures are necessary. However, the injury or mortality of relatively large numbers of non-special-status amphibians (outside of dewatering areas), reptiles, and mammals would still potentially occur as a result of maintenance activities. Due to the potential impacts to large numbers of non-special-status fish and wildlife species over the entire geographic and temporal scope of the 10-year Program Renewal, these impacts would be significant under CEQA.

Non-VHP-covered activities would also result in the loss of habitats for non-special-status fish, amphibians, reptiles, mammals, and birds in the Program Renewal Area. As discussed above, impacts to emergent wetland and herbaceous upland habitats that are maintained in their existing conditions by maintenance activities would be less than significant under CEQA, and no mitigation measures are necessary. However, Program Renewal impacts to other habitats, especially wetland and riparian habitats, would be significant under CEQA. Valley Water will implement BMPs to avoid and minimize the loss of these habitats in the Program Renewal Area. Nevertheless, maintenance activities could result in impacts to extensive areas

of suitable habitat over the 10-year Program Renewal. As discussed above, due to the geographic and temporal extent of these impacts, such impacts would be considered significant under CEQA.

Mitigation measures implemented for impacts to special-status species and their habitats will reduce Program Renewal impacts on non-special-status species to less than significant levels under CEQA. Mitigation Measures BIO-12 and BIO-13, provided under Impacts BIO-2A and BIO-3 below (respectively), would require Valley Water to provide compensatory mitigation for impacts to sensitive wetland, aquatic, and riparian habitats. This mitigation may take a variety of forms, but all mitigation for impacts to those habitats would benefit non-special-status animals, either directly or indirectly through wetland, aquatic, and riparian habitat restoration, enhancement, and protection, which would help to maintain water quality, cover, and instream habitat complexity. Compensatory mitigation would also be provided under Mitigation Measures BIO-1, BIO-2, BIO-3, BIO-4, BIO-5, BIO-7, BIO-8, BIO-9, BIO-10, and BIO-11 for impacts on special-status species and their habitats, and this mitigation (as implemented for special-status species in areas where those species occur) would benefit non-special-status species that occur in similar habitats. Thus, with the implementation of Mitigation Measures BIO-1, BIO-2, BIO-3, BIO-4, BIO-5, BIO-7, BIO-8, BIO-9, BIO-10, and BIO-11, impacts on non-special-status animals and their habitats are reduced to less-than-significant levels under CEQA.

Herbicide application is not covered under the VHP. BMP GEN-2 provides a list of restrictions on herbicide use within streams in the Program Renewal Area. Herbicide use would also be subject to Program Renewal requirements, including application only during appropriate wind conditions to minimize the spread of these chemicals to untargeted areas. With the implementation of BMPs, impacts of herbicide application on non-special-status fish and amphibians would be less than significant under CEQA. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

For all Program Renewal activities (regardless of VHP coverage), maintenance activities could result in the injury or mortality of non-special-status fish, amphibians, reptiles, mammals, and birds in the Program Renewal Area. As discussed above, impacts to species that utilize emergent wetland, herbaceous streambank, and herbaceous upland habitats would be less than significant under CEQA, and no mitigation measures are necessary. However, Program Renewal impacts on non-special-status species in other habitats would be significant under CEQA, especially within wetland and riparian habitats, as these areas support high biodiversity. Valley Water will implement BMPs to reduce the loss of individual native fish and birds to less than significant levels under CEQA. However, the injury or mortality of relatively large numbers of non-special-status amphibians (outside of dewatering areas), reptiles, and mammals would be significant under CEQA.

Regardless of VHP-coverage, Program Renewal activities to emergent wetland and herbaceous upland habitats that are maintained in their existing conditions by maintenance activities would be less than significant under CEQA, and no mitigation measures are necessary. However, Program Renewal impacts to other habitats, especially wetland and riparian habitats, would be significant under CEQA. Valley Water will implement BMPs to avoid and minimize the loss of these habitats in the Program Renewal Area. Nevertheless, Program Renewal impacts would be considered significant under CEQA.

VHP-covered activities would pay VHP fees for VHP-covered impacts on natural land cover types that provide habitat for non-special-status fish, amphibians, reptiles, mammals, and birds in the Program Renewal Area; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats. With the payment of VHP fees and compliance with the VHP's conditions, Program Renewal impacts on non-special-status fish, amphibians, reptiles, mammals, and birds as well as woody riparian and wetland habitats would be reduced to less than significant levels under CEQA. No mitigation measures are necessary.

Non-VHP-covered Program Renewal activities will implement Mitigation Measures BIO-12 and BIO-13, provided under Impacts BIO-2A and BIO-3 below (respectively), which require Valley Water to provide compensatory mitigation for impacts to sensitive wetland, aquatic, and riparian habitats. Compensatory mitigation would also be provided under Mitigation Measures BIO-1, BIO-2, BIO-3, BIO-4, BIO-5, BIO-7, BIO-8, BIO-9, BIO-10, and BIO-11 for impacts on special-status species and their habitats, and this mitigation (as implemented for special-status species in areas where those species occur) would benefit non-special-status species that occur in similar habitats. Thus, with the implementation of Mitigation Measures BIO-1, BIO-1, BIO-2, BIO-3, BIO-4, BIO-5, BIO-7, BIO-8, BIO-9, BIO-10, BIO-11, BIO-12, and BIO-13, impacts of non-VHP-covered Program Renewal activities on non-special-status animals and their habitats are reduced to less-than-significant levels under CEQA.

Impact BIO-1AA: Impacts on the Bay Checkerspot Butterfly (Less than Significant with Mitigation)

IMPACT ASSESSMENT

The Bay checkerspot butterfly may also be affected by maintenance activities that occur adjacent to serpentine habitats in the Program Renewal Area. Suitable habitat for the Bay checkerspot butterfly's host plants (i.e., dwarf plantain [*Plantago erecta*] and purple owl's clover [*Castilleja exserta*]) is present in upland habitats in the Program Renewal Area where serpentine influence is present. In particular, dwarf plantain can be locally abundant in disturbed areas such as levees, and serpentine communities likely occur near certain work sites, such as along Upper Silver Creek. However, no serpentine communities have been identified within maintenance activity areas during Valley Water's surveys in 2004 and 2008, or during the course of surveys performed in support of SMP-2. As a result, the Bay checkerspot butterfly would not occur within Program Renewal work areas and would be unlikely to occur adjacent to these areas. Nevertheless, Bay checkerspot butterflies may be present in serpentine communities adjacent to maintenance activity locations, and projected activities along Upper Silver Creek, Coyote Creek, Calero Creek, and West Little Llagas Creek would occur within or adjacent to designated critical habitat for this species (Figure 3.4-2). Thus, there is some possibility that maintenance activities may impact individual Bay checkerspot butterflies or their habitat.

Because the Bay checkerspot butterfly typically occurs high on hillsides in the Program Renewal Area rather than in the lower-elevation locations where the majority of maintenance activities will occur, impacts to occupied Bay checkerspot butterfly habitat (and individuals) at work locations will be very limited, if in fact such impacts occur at all. Nevertheless, as described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities could result in a variety of impacts on invertebrates such as the Bay checkerspot butterfly, including indirect impacts on individuals and temporary and

permanent impacts on suitable habitat. The Bay checkerspot butterfly and its host plants may be impacted by indirect effects of people or equipment, as well as by herbicide application. Because the Bay checkerspot butterfly (a federally threatened species) is so rare that any occurrence of this species would be significant to the population, take of individuals such that a substantial (i.e., population-level) effect occurs would be considered significant under CEQA. In addition, indirect impacts on serpentine habitat that result in the removal of Bay checkerspot butterfly larval host plants would be considered significant under CEQA due to the restricted habitat range remaining to this species in the Program Renewal Area.

Additional indirect effects of Program Renewal activities on Bay checkerspot butterflies can occur due to nitrogen emitted by maintenance vehicles and equipment. Such nitrogen can fertilize serpentine soils and allow nonnative grasses and forbs that would not typically be able to colonize (at least robustly) serpentine habitats to become established and outcompete Bay checkerspot butterfly host plants. There is some potential for nitrogen emitted by maintenance vehicles and equipment to contribute to significant cumulative nitrogen deposition impacts on Bay checkerspot butterfly host plants growing within or downwind of areas where the nitrogen is emitted. Due to the sensitivity of these species, the cumulative impacts of nitrogen deposition, to which this Program Renewal would contribute, would be significant under CEQA.

Applicable BMPs and VHP Conditions

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on the Bay checkerspot butterfly:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** requires a qualified botanist to identify habitat for special-status plants, including serpentine habitats. Appropriate methods will be used to ensure that maintenance activities avoid all activities within serpentine habitats. In addition, any adjacent serpentine communities would be mapped and delineated in the field, and an appropriate buffer applied to minimize indirect impacts.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants. For activities adjacent to serpentine communities, equipment and tools will be cleaned and sanitized prior to arrival on the site, footwear will be cleaned and disinfected, work will be scheduled to avoid rainy periods as feasible, and erosion control and revegetation materials will be clean with a low risk of *Phytophthora* contamination.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of special-status plants and Bay checkerspot butterflies.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of

materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.

- **BMP GEN-36: Dust Management** requires implementation of measures to reduce dust within and adjacent to work areas, including watering exposed surfaces, covering haul trucks, sweeping streets, and limiting vehicle speeds.
- **BMP REVEG-1: Seeding** would ensure that exposed soils will be stabilized with native seed to prevent erosion.

Most importantly, Valley Water commits to implementing BMP GEN-8 and avoiding all direct and the majority of indirect (with the exception of nitrogen deposition, discussed below) impacts on serpentine communities and species.

VHP-covered Program Renewal activities would be required to comply with the following condition to avoid and minimize impacts on the VHP-covered Bay checkerspot butterfly and serpentine habitat in the Program Renewal Area:

- **Condition 13. Serpentine and Associated Covered Species Avoidance and Minimization** will help to avoid and minimize Program Renewal impacts on serpentine habitats and the Bay checkerspot butterfly.

However, with the implementation of BMP GEN-8, which specifies avoidance of direct impacts on serpentine habitats (which do not geographically overlap maintenance activity areas), compliance with this condition is not anticipated to be needed.

The VHP mitigates nitrogen deposition impacts via the payment of nitrogen deposition fees for new vehicle trips. Maintenance activities, such as those under the Program Renewal, are not subject to the payment of these fees; however, these fees are intended to fund all necessary nitrogen-related mitigation for impacts of all VHP-covered activities, including activities that are and are not subject to the payment of nitrogen deposition fees.

VHP land cover fees and specialty fees for VHP-covered impacts on serpentine habitats in the Program Renewal Area are not anticipated, as no impacts within these areas would occur.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With the implementation of Program Renewal BMPs, the majority impacts of VHP-covered Program Renewal activities on the Bay checkerspot butterfly and its habitat are less than significant under CEQA. Compliance with serpentine-related VHP conditions and payment of VHP impact fees for serpentine land cover types are not anticipated to be needed, as no direct impacts within serpentine habitats would occur. However, due to the sensitivity of serpentine habitats and the rarity of the Bay checkerspot butterfly in the region, to ensure that any residual impacts of Program Renewal activities on this species are reduced to less-than-significant levels, Valley Water will implement Mitigation Measure BIO-1, which specifies the payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for VHP-covered and non-VHP-covered activities to reduce effects of nitrogen deposition.

Activities Not Covered under the VHP

Herbicide application, which is not covered under the VHP, would be avoided directly in serpentine areas per BMP GEN-8, and indirect impacts would be minimized by observing an appropriate non-disturbance buffer around serpentine areas if recommended by a qualified biologist. Thus, with the implementation of BMPs and compliance with applicable regulations, herbicides would not be applied in locations where Bay checkerspot butterflies are present, or in nearby areas using methods that could result in indirect impacts on this species, and impacts of herbicide application on Bay checkerspot butterflies would be less than significant under CEQA. No mitigation measures are necessary.

No maintenance activities within tidal portions of the Program Renewal Area will result in direct adverse effects on Bay checkerspot butterflies, as serpentine habitats do not occur within or near tidal reaches of the Program Renewal Area. For other non-VHP-covered maintenance activities, Valley Water avoids conducting maintenance activities in serpentine areas, and indirect effects on these areas are effectively minimized through BMPs. Thus, with the implementation of BMPs, the majority of impacts of non-VHP-covered Program Renewal activities on the Bay checkerspot butterfly would be less than significant under CEQA. However, due to the sensitivity of serpentine habitats and the rarity of the Bay checkerspot butterfly in the region, to ensure that any residual impacts of nitrogen deposition from Program Renewal activities are reduced to less-than-significant levels, Valley Water will implement Mitigation Measure BIO-1, which specifies the payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for non-VHP-covered (and VHP-covered) activities to reduce effects of nitrogen deposition.

SUMMARY AND CONCLUSION

Program Renewal activities could result in significant indirect impacts on Bay checkerspot butterflies due to the loss of individuals and/or habitat. However, for all Program Renewal activities (regardless of VHP coverage), BMPs will ensure that indirect impacts are effectively minimized. In addition, Valley Water will implement Mitigation Measure BIO-1, which specifies payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for all Program Renewal activities (regardless of VHP coverage) to reduce effects of nitrogen deposition.

For both VHP-covered and non-VHP-covered activities, with the implementation of Program Renewal BMPs and Mitigation Measure BIO-1, impacts on the Bay checkerspot butterfly are less than significant under CEQA.

Impact BIO-2: A substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by CDFW or USFWS (Less than Significant with Mitigation)

The CDFW defines sensitive natural communities and vegetation alliances using NatureServe's standard heritage Program Renewal methodology (CDFW 2024a), as described above under *Sensitive Natural Communities, Vegetation Alliances, and Habitats*. Aquatic, wetland, and riparian habitats are also protected under applicable federal, state, or local regulations, and are generally subject to regulation, protection, or consideration by the

USACE, RWQCB, CDFW, and/or the USFWS. Program Renewal impacts on sensitive riparian habitats are considered and evaluated under Impact BIO-2A, and impacts on other sensitive natural communities, vegetation alliances/associations, or other such communities identified in local or regional plans, policies, and regulations are evaluated under Impact BIO-2B. Sensitive wetland and aquatic habitats are addressed separately under Impact BIO-3 below. Non-special status species associated with wetlands and riparian habitats are discussed separately under Impact BIO-1Z.

Impact BIO-2A: Loss or Disturbance of Riparian Habitat, Including Sycamore Alluvial Woodland (Less than Significant with Mitigation)

IMPACT ASSESSMENT

Sensitive riparian habitats are located along streams throughout the Program Renewal Area. Because maintenance activities are focused along channels, such activities would result in the loss, modification, and/or disturbance of extensive areas of riparian vegetation in the Program Renewal Area, estimated at 4,888 acres of herbaceous streambank habitat (which is typically California annual grassland or ruderal habitat along streambanks) and 91 acres of woody riparian habitat (including willow riparian forest and scrub, central California sycamore alluvial woodland, and mixed riparian woodland and forest VHP land cover types) over the course of the Program Renewal (Table 3.4-5).

Riparian habitats in the Program Renewal Area include the CDFW-designated sensitive sycamore alluvial woodland plant community. No activities are projected within the highest-quality occurrences of sycamore alluvial woodland, such as those along Coyote Creek from U.S. Highway 101 downstream to the Ogier Ponds, or along Pacheco Creek. However, maintenance activities could result in temporary or permanent impacts on 3 acres of sycamore alluvial woodland habitat (Table 3.4-6).

As described above under "Impacts on Non-Instream Sensitive Plant Communities" above, maintenance activities could result in the loss of riparian vegetation through direct removal, herbicide use, trampling, and other impacts. During any bank stabilization, sediment removal, vegetation management, and animal conflict management activity that would occur in or adjacent to riparian habitat, equipment use, vehicle traffic, and worker foot traffic may result in the injury or mortality of individual plants. These activities could result in death, altered growth, or reduced seed set through physically breaking, crushing, wilting, or uprooting plants, and the compaction of soil by heavy equipment could damage plant roots. In addition, vegetation management activities and the creation of access routes and staging areas may result in the mechanical or physical removal of vegetation as a result of off-target herbicide contact via drift.

The majority of Program Renewal impacts within riparian habitats (4,887 acres, or 99 percent of the Program Renewal's impacts within herbaceous streambank vegetation; and 86 acres, or 95 percent of the Program Renewal's impacts within woody riparian vegetation) would be temporary in that they would not preclude the regeneration of the existing vegetation. However, the repetitive nature of impacts in at least some areas would result in longer-term effects over the 10-year duration of the Program Renewal. In addition, permanent impacts would occur in areas where activities such as bank stabilization would result in the permanent loss of natural areas, or where other maintenance activities would require the permanent removal of vegetation. The Program Renewal would also contribute

to the long-term modification of riparian plant communities if certain plant species are targeted by maintenance activities. For example, young cottonwoods are often removed during vegetation management, which prevents these trees from maturing into the large trees that provide habitat for a number of wildlife species. Cottonwoods already suffer the effects of anthropogenic stream modification, including restrictions on the ability of streams in urban areas to meander, and thus regeneration of cottonwood-dominated forests in urban Santa Clara County is poor under existing conditions. Maintenance activities that would further prevent the maturation of cottonwoods in the Program Renewal Area could contribute to the long-term decline in multi-aged cottonwood-dominated riparian forests in the region.

As discussed under "Environmental Setting" above, woody riparian habitats in the Program Renewal Area provide a wide range of biological functions for wildlife, including aquatic habitat for fish and other aquatic species, foraging and nesting habitat for birds, and movement corridors for numerous terrestrial species. As a result, impacts to riparian habitats would affect a variety of fish and wildlife species in addition to the plant community that occurs there. Impacts on common and special-status plant and wildlife species resulting from disturbance or loss of riparian habitat are addressed under Impact BIO-1 above. Due to the sensitivity of woody riparian habitats (including willow riparian forest and scrub, central California sycamore alluvial woodland, and mixed riparian woodland and forest), their value to wildlife communities, and the potential for extensive effects of the Program Renewal on these habitats over time, temporary and permanent impacts on woody riparian habitats would be considered significant under CEQA.

Herbaceous streambank vegetation often includes nonnative species such as black mustard (*Brassica nigra*), poison hemlock, perennial ryegrass (*Lolium perenne*), Italian thistle, bristly ox-tongue, sweet fennel (*Foeniculum vulgare*), and smilograss (*Stipa miliacea*). Such vegetation typically dominates the banks of reaches that would be frequently disturbed by maintenance activities. Herbaceous vegetation, including communities dominated by natives and nonnatives, regenerates quickly and, compared to woody riparian vegetation dominated by trees and shrubs, provides relatively low habitat functions and values for wildlife. As a result, temporary and permanent impacts of Program Renewal activities on herbaceous streambank vegetation would not have substantial ecological effects, and these impacts are less than significant under CEQA.

The majority of impacts of herbicide application (28 of 29 acres, or 97 percent) and vegetation management (43 of 56 acres, or 77 percent) will occur within existing PMAs (Table 3.4-5). If in-perpetuity mitigation has already been provided for impacts of a particular activity along a given reach (e.g., in a PMA), Program Renewal impacts within these areas are considered less than significant, and no additional mitigation is necessary under CEQA. However, mitigation may be required for conducting a different maintenance activity along that reach. For example, if mitigation was previously provided in perpetuity only for herbicide application along a given reach, no additional mitigation for herbicide application along that reach would be necessary, but mitigation for vegetation management activities along that reach would be necessary.

Applicable Best Management Practices and VHP Conditions

Valley Water will implement the following BMPs to minimize impacts on riparian habitat in the Program Renewal Area:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-20: Hazard Tree Removal** limits surface soil disturbance, requires revegetation with appropriate native woody species, and prohibits removal of any tree known to have supported Swainson's hawk, bald eagle, or golden eagle nests within the past five years.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.
- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.

In addition to Valley Water BMPs, VHP-covered Program Renewal activities will comply with the following condition to avoid and minimize impacts on riparian habitat:

- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees occurring outside of an existing PMA, as well as specialty fees for impacts to riparian habitats. The specialty fees are used by the Habitat Agency to restore, protect, and manage riparian habitats, among other habitats, in the VHP area; these fees are set so that the riparian restoration, protection, and management performed by the Habitat Agency mitigates all impacts of VHP-covered activities on riparian habitats to less than significant levels. The VHP will acquire a minimum of 250 acres of riparian forest and scrub and 40 acres of central California sycamore alluvial woodland (ICF International 2012). Restoration or creation of up to approximately 339 acres of riparian forest and scrub in the Reserve System is also anticipated (ICF International 2012). For every 1 acre of willow riparian forest and scrub and mixed riparian forest and woodland impacted by VHP-covered activities, 2 acres will be preserved and enhanced, and 1 acre will be restored, for a mitigation ratio of 3:1. For every 1 acre of central California sycamore alluvial woodland impacted by VHP-covered activities, 2 acres will be preserved and enhanced and 2 acres will be restored, for a mitigation ratio of 4:1.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. With the implementation of Program Renewal BMPs, compliance with applicable VHP conditions, and payment of VHP impact fees (including specialty fees for impacts to riparian habitat) for impacts occurring outside of existing PMAs, temporary and permanent impacts of VHP-covered Program Renewal activities on riparian habitat (including sycamore alluvial woodland) are less than significant under CEQA, and no mitigation measures are necessary.

Activities Not Covered under the VHP

No Program Renewal impacts within tidal portions of the Program Renewal Area will result in adverse effects on riparian habitat, as this habitat type does not occur within tidal habitats in the Program Renewal Area.

BMP GEN-8 states that prior to conducting herbicide use, sensitive habitats (including riparian habitats) would be identified and, if present, a qualified biologist would recommend appropriate measures (e.g., maintaining a no-disturbance buffer or adjusting the timing of activities) to avoid and minimize effects. BMP GEN-8 also specifies that a qualified biologist will determine if a given type of vegetation management is ecologically appropriate, and alternative strategies will be considered based on the biologist's recommendations. Thus, with the implementation of BMPs, impacts of herbicide application on riparian habitats would be less than significant under CEQA, and no mitigation measures are necessary.

For other non-VHP-covered maintenance activities, even with the implementation of BMPs, temporary and permanent impacts on riparian habitat would be considered significant under CEQA due to the sensitivity of woody riparian habitat, its value to wildlife communities, and the potential for extensive effects of the Program Renewal on this habitat over time.

Mitigation Measure BIO-12 below would be implemented to reduce this impact to a less than significant level.

Mitigation Measure BIO-12: Compensatory Mitigation for Impacts to Woody Riparian Vegetation

The Program Renewal's compensatory mitigation package, which is detailed in Chapter 10 of the SMP Manual, shall be implemented by Valley Water to compensate for new impacts (i.e., impacts that do not fall within an existing PMA for the activity being performed) on woody riparian vegetation from non-VHP-covered activities. No compensatory mitigation will occur for corrective pruning. Following the procedure described under "Mitigation Feasibility Assessment, Monitoring, Reporting, and Success Criteria" above and in *Appendix F*, Valley Water would refine the quantification of impacts to riparian vegetation that occur during a specific year, tallying the impact totals at the end of the year, and compensatory mitigation will be implemented the following year, in many cases. Exceptions will occur in cases in which compensatory mitigation is incorporated directly into the Program Renewal work areas; in those cases, compensatory mitigation may be implemented during the same year in which impacts occur. Details regarding performance criteria for mitigation, as well as for monitoring and reporting, are described under "Mitigation Feasibility Assessment, Monitoring, Reporting, and Success Criteria" above and in *Appendix F*.

Valley Water will mitigate for temporary and permanent impacts to riparian vegetation from non-VHP-covered activities via one or more of the following options:

- Develop new land acquisition and conservation-based projects to create new PMAs as mitigation for impacts to riparian habitats.
- Annual mitigation approaches for activities that are more infrequent, and where establishing new PMAs would not be appropriate, such as encampment cleanup and bank rehabilitation, a grant program to fund projects by local watershed groups, trash removal, revegetation, concrete removal, and post-wildfire rehabilitation.
- For impacts to nontidal wetlands and aquatic habitats, the payment of fees via the Habitat Agency's Voluntary Fee Payments Policy. This option would be subject to consistency with VHP requirements and Habitat Agency approval, and contingent on the Habitat Agency agreeing to use Valley Water's fees to provide mitigation for the resource (i.e., riparian habitat) being affected.
- Individual, stand-alone restoration projects that could provide either permanent or temporary annual mitigation, such as the following:
    - Riparian revegetation would be conducted to establish and/or enhance habitat for native wildlife species while providing shade, sources of organic matter, coarse woody debris, improved root and soil structures and other benefits. Revegetation would occur in the

same watershed as the impact and would follow the typical planting palette provided in Chapter 10 or a site-specific palette would be used. ~~Removal of trees >6" dbh that is not mitigated through the VHP will be mitigated through revegetation at a minimum 1:1 ratio.~~ Removal of non-invasive trees >6" dbh that is not mitigated through the VHP will be mitigated through revegetation at either a 2:1 or 3:1 (replacement tree to removed tree). All native trees >6" dbh that are not removed will be mitigated at a 3:1 ratio. All non-native trees >6" dbh that are not classified as invasive species will be mitigated at a 2:1 ratio. ~~For each removed non-invasive tree >6" dbh that provides unique functions and values and is otherwise healthy that is removed, Valley Water will install one native tree on a mitigation site within the same watershed.~~ The removal of >6" dbh western sycamores and native oaks must be replaced in-kind; otherwise, there is no requirement to match species when replacing trees.

- Valley Water in consultation with resource agencies may develop reach characterization sheets for areas where frequent maintenance activities occur. These sheets would describe biological resources, water quality, and ecological functions within the maintenance area, and identify ongoing and future maintenance needs, opportunities to avoid and minimize impacts to sensitive habitats as well as potential restoration opportunities. This information would be used for planning purposes to maintain a site in a state of ecological equilibrium. If vegetation management (other than the removal of trees >6" dbh, the conversion of habitat from one type to another, or activities that impact the site's function as habitat for special-status species) within a reach can be directed towards achieving that reach's target ecological function and value, then the maintenance work may be exempt from compensatory mitigation requirements.
- Valley Water will enhance ecosystem recovery following particularly large and destructive wildfires. Mitigation activities may include, but are not limited to, revegetation and hydroseeding to reduce erosion, invasive plant species control, road repair, and removing critical safety hazards (e.g., dead or dying trees) thereby promoting and supporting habitat for animal and plant species and reducing risk of additional fires that could further damage habitat.

Valley Water will mitigate impacts to sensitive riparian communities, including sycamore alluvial woodland, oak woodland, and high-quality occurrences of cottonwood-dominated forest in-kind by focusing on the enhancement, preservation, and/or restoration of that sensitive community type. "High-quality" would be determined by a qualified biologist based on criteria such as evidence of natural regeneration and the presence of multi-layered and multi-aged stands. It is possible that this mitigation measure may be refined during permitting with the USACE,

RWQCB, and CDFW to be equally or more effective, in which case the refinements required by these resource agencies would be implemented.

SUMMARY AND CONCLUSION

With implementation of BMPs, compliance with VHP conditions, and payment of VHP fees, impacts of VHP-covered Program Renewal activities on riparian habitat are less than significant under CEQA, and no mitigation measures are necessary.

Although BMPs would reduce the magnitude and extent of non-VHP-covered Program Renewal impacts on riparian habitat, residual impacts would remain due to the temporary (short-term degradation) and permanent loss of habitat. Mitigation Measure BIO-12 would be implemented to reduce this residual impact to a less-than-significant level.

As discussed above, riparian vegetation in some work sites would include herbaceous vegetation rather than woody vegetation. Compared to woody riparian vegetation dominated by trees and shrubs, such vegetation regenerates quickly and generally provides relatively low functions and values for wildlife. As a result, impacts of Program Renewal activities on non-wetland, herbaceous streambank vegetation are less than significant, and no mitigation for such impacts is required.

Impact BIO-2B: Loss or Disturbance of Non-Riparian/Non-Wetland Sensitive Plant Communities (Less than Significant)

IMPACT ASSESSMENT

Sensitive plant communities (see "Sensitive Natural Communities, Vegetation Alliances, and Habitats" above) that could be impacted by Program Renewal activities, other than riparian communities (addressed under Impact BIO-2A above) and wetland communities (addressed under Impact BIO-3 below) can occur within or adjacent to maintenance activity areas within the following VHP land cover types: oak woodlands (including valley oak woodland, mixed oak woodland and forest, blue oak woodland, and coast live oak forest and woodland), serpentine habitats (including serpentine rock outcrop/barrens, serpentine bunchgrass grassland, and mixed serpentine chaparral), non-serpentine native grassland, coyote brush scrub, northern coastal scrub/Diablan sage scrub, and northern mixed chaparral/chamise chaparral. Estimates of temporary and permanent impacts of Program Renewal activities within these communities are as follows:

- Impacts to oak woodland communities would occur in upland locations where vegetation adjacent to channels is dominated by oaks. Approximately 5 acres of oak woodland would be impacted by the Program Renewal (Table 3.4-6). Approximately 60 percent of Program Renewal impacts within oak woodland habitats (3 acres) would be temporary in that they would not preclude the regeneration of the existing vegetation.
- Projected activities would occur very close to serpentine communities (Figure 3.4-2), but no direct impacts within serpentine bunchgrass habitat or any other serpentine land cover type would occur under the Program Renewal. However, these communities occur adjacent to Program Renewal work locations, and indirect effects can potentially occur.

- Because the majority of the Program Renewal's impacts will occur within existing PMAs (for sediment removal, aquatic herbicide application, and vegetation management) where Program Renewal activities have been ongoing for many years, as well as within areas where maintenance occurs annually (for mechanical mowing and hand weed abatement), the potential for maintenance activities to result in the loss of non-serpentine native grassland, coyote brush scrub, northern coastal scrub/Diablan sage scrub, and northern mixed chaparral/chamise chaparral land cover types is expected to be very limited, if such impacts occur at all.

As described above under "Impacts on Sensitive Natural Communities", Program Renewal activities may affect sensitive plant communities due to direct or indirect disturbance of vegetation and the disturbance, modification, or destruction of habitat. During any bank stabilization, sediment removal, vegetation management, and animal conflict management activity that would occur in or adjacent to sensitive habitats, equipment use, vehicle traffic, and worker foot traffic may result in the injury or mortality of individual plants. These activities could result in death, altered growth, or reduced seed set through physically breaking, crushing, wilting, or uprooting plants, and the compaction of soil by heavy equipment could damage plant roots. In addition, vegetation management activities and the creation of access routes and staging areas may result in the mechanical or physical removal of vegetation as a result of off-target herbicide contact via drift.

As discussed under "Environmental Setting" above, sensitive plant communities are often of limited distribution, and frequently support special-status species or high numbers of common species. Thus, the conservation of these natural communities is integral to maintaining biological diversity. Program Renewal impacts to these communities would be extremely limited. No direct impacts would occur within serpentine habitats; any effects on these habitats would be due to indirect impacts such as dust, off-target herbicide application, or nitrogen deposition (the latter is discussed in additional detail below). Direct impacts to non-serpentine native grassland, coyote brush scrub, northern coastal scrub/Diablan sage scrub, and northern mixed chaparral/chamise chaparral land cover types are expected to be very limited, if such impacts occur at all. Further, permanent impacts to 2 acres of oak woodlands, and temporary impacts to 3 acres of these woodlands, are extremely limited relative to the widespread distribution of this community in the Program Renewal Area. Due to the limited extent of Program Renewal impacts on sensitive oak woodlands, serpentine habitats, non-serpentine native grassland, coyote brush scrub, northern coastal scrub/Diablan sage scrub, and northern mixed chaparral/chamise chaparral relative to their regional distributions, Program Renewal activities would not result in any substantial decline in these communities, or the plant and wildlife species they support, in the region. As a result, these impacts would be less than significant under CEQA.

Additional indirect effects of Program Renewal activities on sensitive serpentine communities can occur due to nitrogen emitted by maintenance vehicles and equipment. Such nitrogen can fertilize serpentine soils and allow nonnative grasses and forbs that would not typically be able to colonize (at least robustly) serpentine habitats to become established and outcompete serpentine plants. There is some potential for nitrogen emitted by maintenance vehicles and equipment to contribute to significant cumulative nitrogen deposition impacts on serpentine habitats located downwind of areas where the nitrogen is emitted.

APPLICABLE BEST MANAGEMENT PRACTICES

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on sensitive vegetation communities:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread of Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants. For activities adjacent to serpentine communities, equipment and tools will be cleaned and sanitized prior to arrival on the site, footwear will be cleaned and disinfected, work will be scheduled to avoid rainy periods as feasible, and erosion control and revegetation materials will be clean with a low risk of *Phytophthora* contamination.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and habitat requirements of special-status plants.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-36: Dust Management** requires implementation of measures to reduce dust within and adjacent to work areas, including watering exposed surfaces, covering haul trucks, sweeping streets, and limiting vehicle speeds.
- **BMP REVEG-1: Seeding** would ensure that exposed soils will be stabilized with native seed to prevent erosion.

Valley Water commits to implementing BMP GEN-8 and avoiding all direct impacts on serpentine communities and minimizing indirect impacts on these communities.

In addition, for VHP-covered activities, compliance with the following habitat plan conditions will reduce impacts on sensitive natural communities in the Program Renewal Area:

- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 13. Serpentine and Associated Covered Species Avoidance and Minimization,** will help to avoid and minimize Program Renewal impacts on serpentine habitats.

- **Condition 14. Valley Oak and Blue Oak Woodland Avoidance and Minimization** requires projects located on sites supporting substantial stands of valley or blue oak woodland to minimize impacts.

However, with the implementation of BMP GEN-8 and Valley Water's commitment to avoiding direct impacts on serpentine habitats, compliance with Condition 13 is not anticipated to be needed.

The VHP mitigates nitrogen deposition impacts via the payment of nitrogen deposition fees for new vehicle trips. Maintenance activities, such as those under the Program Renewal, are not subject to the payment of these fees; however, these fees are intended to fund all necessary nitrogen-related mitigation for impacts of all VHP-covered activities, including activities that are and are not subject to the payment of nitrogen deposition fees. Therefore, impacts of nitrogen emissions of VHP-covered Program Renewal activities are mitigated by the VHP even though the Program Renewal's nature does not necessitate payment of VHP nitrogen deposition fees.

Valley Water will pay VHP fees for impacts on oak woodlands, non-serpentine native grassland, coyote brush scrub, northern coastal scrub/Diablan sage scrub, and northern mixed chaparral/chamise chaparral, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County, including targeted management of non-serpentine native grassland, chaparral and northern coastal scrub, and oak woodland communities by the VHP's Conservation Strategy (ICF International 2012). Coyote brush scrub is not a targeted community type but is preserved by the Habitat Agency in the course of meeting other requirements (ICF International 2012). During implementation of the VHP, the Habitat Agency will protect at least 17,100 acres of oak woodland habitats, including the acquisition of 1,700 acres of valley oak woodland, 7,100 acres of mixed oak woodland and forest, 2,900 acres of coast live oak woodland and forest, 1,100 acres of blue oak woodland, and 80 acres of foothill pine-oak woodland (ICF International 2012). In addition, the Habitat Agency will protect at least 2,500 acres of chaparral and northern coastal scrub and acquire at least 400 acres of northern mixed chaparral/chamise chaparral and at least 1,400 acres of northern coastal scrub/Diablan sage scrub. Specific acquisition targets are not established for native grasslands or coyote brush scrub.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. The majority of impacts of VHP-covered Program Renewal activities on sensitive natural communities would be less than significant under CEQA due to the limited extent of impacts on these communities relative to their regional distributions. However, due to the sensitivity of serpentine habitats in the region, to ensure that any residual impacts of Program Renewal activities on serpentine habitats are reduced to less-than-significant levels, Valley Water will implement Mitigation Measure BIO-1, which specifies the payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for VHP-covered (and non-VHP-covered) activities to reduce effects of nitrogen deposition. With the implementation of BMPs, compliance with applicable

VHP conditions, and payment of VHP impact fees (including nitrogen deposition fees as specified in Mitigation Measure BIO-1), direct and indirect effects of the Program Renewal on sensitive natural communities would be effectively avoided and minimized.

Activities Not Covered under the VHP

Maintenance activities located in tidal portions of the Program Renewal Area would not result in direct or indirect impacts on oak woodlands, serpentine habitats, non-serpentine native grassland, coyote brush scrub, northern coastal scrub/Diablan sage scrub, or northern mixed chaparral/chamise chaparral, as these communities do not occur within tidal habitats in the Program Renewal Area.

Herbicide application, which is not covered under the VHP, would be avoided directly in serpentine areas per BMP GEN-8, and indirect impacts would be minimized by observing an appropriate non-disturbance buffer around serpentine areas. Thus, with the implementation of BMPs, impacts of herbicide application on sensitive vegetation communities would be effectively minimized. No mitigation measures are necessary.

The majority of impacts of non-VHP-covered Program Renewal activities on sensitive natural communities would be less than significant under CEQA due to the limited extent of impacts on these communities relative to their regional distributions. However, Valley Water will implement Mitigation Measure BIO-1, which specifies payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for all Program Renewal activities (regardless of VHP coverage) to reduce effects of nitrogen deposition. With the implementation of BMPs and Mitigation Measure BIO-1, direct and indirect effects of the Program Renewal on sensitive natural communities habitats would be effectively avoided and minimized.

SUMMARY AND CONCLUSION

The majority of impacts of Program Renewal activities on sensitive natural communities would be less than significant under CEQA due to the limited extent of impacts on these communities relative to their regional distributions, regardless of VHP coverage. However, Valley Water will implement Mitigation Measure BIO-1, which specifies payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy for all Program Renewal activities (regardless of VHP coverage) to reduce effects of nitrogen deposition. With the implementation of BMPs, compliance with applicable VHP conditions and payment of VHP land cover fees (for VHP-covered activities), and payment of VHP nitrogen deposition fees through the Habitat Agency's Voluntary Fee Payments Policy (regardless of VHP coverage) as specified in Mitigation Measure BIO-1, effects of the Program Renewal on sensitive natural communities habitats would be effectively avoided and minimized.

Impact BIO-3: A substantial adverse effect on State or federally protected wetlands and waters through direct removal, filling, hydrological interruption, or other means (Less than Significant with Mitigation)

Impact BIO-3: Impacts on State or Federally Protected Wetland and Aquatic Habitats (Less than Significant with Mitigation)

IMPACT ASSESSMENT

Maintenance activities associated with the Program Renewal would result in the short-term, but repetitive, disturbance of wetland (i.e., coastal and valley freshwater marsh, seasonal wetland, tidal salt marsh, and tidal brackish marsh) and aquatic (i.e., riverine, open water, pond, tidal, and intertidal) habitats that provide valuable habitat for fish and wildlife. As described under "Impacts on Instream Aquatic and Wetland Communities" above, these activities could result in the placement of fill, hydrological interruption (e.g., dewatering or diversion), alteration of bed and bank, degradation of water quality (e.g., increased sedimentation and turbidity, herbicide contamination), and other direct impacts. Impacts on special-status animal species resulting from disturbance or loss of wetland and aquatic habitat are addressed separately under Impact BIO-1 above.

Table 3.4-5 provides a summary of Program Renewal impacts within nontidal vegetated wetlands (coastal and valley freshwater marsh and seasonal wetland), tidal vegetated wetlands (tidal salt marsh and tidal brackish marsh), nontidal aquatic habitat (riverine), and tidal aquatic habitat (tidal and intertidal), and Table 3.4-6 provides a summary of Program Renewal impacts within northern coastal salt marsh and seasonal wetlands (which are a subset of the impact acreages provided in Table 3.4-5, and are not additive to those impacts). These impacts are summarized as follows:

- The Program Renewal will impact an estimated 422.4 acres of nontidal vegetated wetlands (coastal and valley freshwater marsh and seasonal wetland), and 21.6 acres of tidal vegetated wetlands (tidal salt marsh and tidal brackish marsh). The majority of these impacts (421.4 acres of nontidal impacts and almost all tidal impacts) would be temporary.
    - Of the impacts on tidal vegetated wetlands, Program Renewal activities would impact approximately 10 acres of northern coastal salt marsh habitat (approximately 9 acres of which would be temporary)
    - Of the impacts on nontidal vegetation wetlands, Program Renewal activities would impact 4 acres of seasonal wetlands (almost all temporary).
- The Program Renewal will impact an estimated 105.7 acres of nontidal aquatic (riverine) habitat, and 8.3 acres of tidal aquatic (tidal and intertidal) habitat. The majority of these impacts (104.7 acres of nontidal impacts and almost all tidal impacts) would be temporary.

It is expected that all of these wetlands will be waters of the state regulated by RWQCB, and the USACE will regulate most (or possibly all) of these wetlands as waters of the U.S. because they will have connectivity downstream. However, the USACE may also determine that certain wetlands that do not have connectivity to navigable waters, and possibly some

ephemeral drainages, are not waters of the U.S. As necessary, Valley Water will coordinate with the USACE to determine whether any wetlands or streams impacted by Program Renewal activities are not jurisdictional waters of the U.S.

Wetlands serve a variety of important functions, such as sediment stabilization, sediment/toxicant retention, nutrient removal/transformation, and aquatic and terrestrial wildlife species habitat. These functions may be adversely affected as a result of sediment removal, vegetation management, bank stabilization, and other Program Renewal activities.

Valley Water studies have found that wetland vegetation in some areas often quickly re-establishes following sediment removal activities. The *Instream Wetland Vegetation Regrowth Study* (Rankin and Hillman 2000) found 65 percent and 98 percent average regrowth within 1 and 2 years, respectively, after 1997 sediment removal at six non-tidal freshwater study sites. Average regrowth on two tidal study sites was less, at 21 percent and 29 percent after one and two years, respectively. The pattern of rapid re-establishment, with greater rates in non-tidal than in tidal areas, was supported by regrowth study results on four additional 1998 sediment removal sites. After one year, those sites supported more non-tidal wetland than was present before sediment removal and almost 70 percent of the tidal wetland that was present before sediment removal.

Vegetation dominance and quality (as represented by vegetation type, total percent cover of vegetation, and relative percent cover of native and nonnative species) were similar between pre- and post-project years on both sediment removal work sites and reference sites on which sediment removal had not been conducted for several years. At most sites, however, some vegetation shifts did occur. Most shifts were neutral or positive, from the perspective of long-term effects on native communities, including full or partial transition from one native-dominated vegetation type to another, disappearance of a nonnative vegetation type, or increased total percent cover. Potentially negative changes occurred less frequently, including slightly increased invasive species cover, appearance or increase in amount of a nonnative vegetation type, and decrease in total percent cover.

The *Instream Wetland Vegetation Regrowth Study* (Rankin and Hillman 2000), as well as anecdotal observations by Valley Water biological and vegetation management staff, indicate that wetland extent and species composition are affected by vegetation management. Herbicide spraying likely reduces the amount of the target vegetation present (mostly cattails) in freshwater and tidal wetlands in years following the treatment. By targeting perennial emergent vegetation with herbicides, which kill the entire plant, other wetland vegetation types, such as other herbaceous wetland species and nonnative annuals, appear to be favored. Herbaceous wetland vegetation also benefits from the targeted removal of woody riparian saplings, either by herbicide or hand removal, which would otherwise shade out wetland plants.

The study area for the *Instream Wetland Vegetation Regrowth Study* mostly included leveed and excavated channels in lower valley sites where work had been done previously. Therefore, the results of that study are not necessarily applicable to the new work areas, especially higher-elevation areas where sediment removal has not previously been performed. Notably, species composition in these higher-elevation areas is different, and these species are likely much less adapted to disturbance from typical Valley Water maintenance activities. Furthermore, these studies occurred during wet years, and their applicability during drought years is unknown.

Based on this information, the vast majority of impacts to freshwater and tidal marsh in the Program Renewal Area would be short-term (as reflected in the acreages provided in Tables 3.4-4 and 3.4-5), because vegetated marsh would restore to existing conditions within 1-2 years following maintenance activities. Because tidal and nontidal stream systems in the Program Renewal Area are dynamic, the extent of wetland habitats changes constantly as part of natural processes, and maintenance activities can be similar to the natural changes experienced by these communities. In addition, flows in the channel will wash away any minor sedimentation or changes in topography that result from maintenance activities, restoring the channel to typical conditions following the completing of the work. Further, no planting or restoration within these areas is likely to be needed (or would typically be prescribed, such as under a Mitigation and Monitoring Plan) because wetland species such as cattails, bulrush, and pickleweed produce airborne seeds that re-establish quickly following disturbance. Due to these combined factors, temporary impacts of the Program Renewal on instream freshwater wetlands (i.e., coastal and valley freshwater marsh) and tidal wetlands (i.e., northern coastal salt marsh) would be less than significant under CEQA. However, permanent impacts that result in the loss of these habitats would be considered significant under CEQA because it would result in the loss of ecologically valuable wetlands.

Program Renewal impacts would also occur within seasonal wetlands. Wetland vegetation within these areas would be likely to restore quickly following impacts, as described for in-stream freshwater and tidal wetlands above, and thus these impacts are expected to be temporary.

Excessive erosion and sedimentation that occur a result of maintenance activities would be considered significant under CEQA if they lead to the permanent loss of wetlands (e.g., due to permanent changes in topography, or because the disturbance does not allow revegetation, or promotes the revegetation of nonnative vegetation).

For northern coastal salt marsh habitat, if Program Renewal impacts (typically from heavy equipment) compact the soils sufficiently (e.g., 6–12 inches), this can prevent pickleweed and other native marsh vegetation from coming back in those areas. This would result in the permanent conversion of marsh habitat to tidal aquatic habitat, which would be a significant impact under CEQA due to the loss of vegetated wetlands.

Bank repair would result in permanent impacts to less than 1 acre of nontidal aquatic habitat under the Program Renewal; all other Program Renewal impacts on tidal and nontidal aquatic habitats would be temporary (Table 3.4-5). This would result in the permanent conversion of aquatic habitat to developed areas, which would be a significant impact under CEQA due to the loss of habitat for aquatic plant and animal communities. Open-water aquatic habitat that is temporarily impacted by maintenance activities would be restored to pre-impact conditions following temporary impacts of maintenance activities. However, as discussed under “Impacts on Instream Aquatic and Wetland Communities” above, maintenance activities could degrade water quality within these areas. This would be considered a significant impact under CEQA due to the degradation of in-stream aquatic habitats that support sensitive aquatic communities.

The majority of impacts of sediment removal (20 of 28 acres, or 71 percent), herbicide application (337 of 342 acres, or 98 percent), and vegetation management (55 of 72 acres, or 76 percent) on vegetated wetlands will occur within existing PMAs, and the majority of impacts of sediment removal (80 of 112 acres, or 71 percent) will also occur within existing

PMAs (Table 3.4-5). If in-perpetuity mitigation has already been provided for impacts of a particular activity along a given reach (e.g., in a PMA), Program Renewal impacts within these areas are considered less than significant, and no additional mitigation is necessary under CEQA. However, mitigation may be required for conducting a different maintenance activity along that reach. For example, if mitigation was previously provided in perpetuity only for herbicide application along a given reach, no additional mitigation for herbicide application along that reach would be necessary, but mitigation for vegetation management activities along that reach would be necessary.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize Program Renewal impacts on wetlands:

- **BMP GEN-1: In-Channel Work Windows** specifies work windows for certain maintenance activities to minimize work activities within wetted portions of channels.
- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands) are identified and disturbance within these areas is avoided and minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs.
- **BMP GEN-25: Erosion and Sediment Control Measures** provides erosion control measures to minimize erosion and sedimentation as a result of work activities.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-27: Sediment Transport** ensures that truck beds will be lined to prevent sediment-laden water from being released back into waterways during transport.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-33: Spill Prevention and Response** provides measures to prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.

- **BMP GEN-37: Vehicle and Equipment Maintenance** provides measures to ensure that vehicles and equipment are kept clean and free of leaks, and no heavy equipment is operated in a live stream where feasible.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.
- **BMP GEN-39: Vehicle and Equipment Fueling** will minimize the potential for fuel to spill into channels.
- **BMP GEN-40: Dewatering for Non-Tidal Sites** provides procedures for diverting water around work areas at non-tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-41: Dewatering in Tidal Work Areas** provides procedures for diverting water around work areas in tidal locations to avoid and minimize impacts to water quality.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** provides measures to maintain and operate pumps and generators to minimize impacts on water quality and aquatic species.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** specifies that if high levels of groundwater are encountered during excavations, the water will be managed to ensure that it does not cause water quality degradation in a live stream.
- **BMP SED-3: Restore Channel Features** states that low-flow channels within non-tidal streams will be contoured to facilitate fish passage and emulate pre-construction conditions as closely as possible.
- **BMP VEG-1: Minimize Local Erosion Increase from In-Channel Vegetation Removal** states that the toe of the bank will be protected by leaving vegetation to the maximum extent possible.
- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** requires low–ground pressure equipment to be used to cut or remove instream vegetation, to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** requires the site design to be adjusted to prevent potential downstream erosion.

In addition to Valley Water BMPs, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts on wetlands:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.

Valley Water would also pay VHP fees for VHP-covered impacts in the Program Renewal Area occurring outside of existing PMAs, including land cover fees and specialty fees for impacts to wetlands; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats. The VHP will acquire a minimum of 10 acres of coastal and valley freshwater marsh, 5 acres of seasonal wetlands, 50 acres of ponds and 100 miles of streams (ICF International 2012). Restoration or creation of up to approximately 75 acres of wetlands, 72 acres of ponds, and 10.4 miles of streams in the Reserve System is also anticipated (ICF International 2012). For every 1 mile of streams impacted, 3 miles must be preserved and enhanced (3:1) and 1 mile must be restored (1:1) for a total mitigation ratio of 4:1.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

No VHP-covered activities would impact tidal vegetated wetlands or tidal aquatic habitats, as such impacts would occur outside of the current and future VHP permit area.

The majority of Program Renewal activities will be covered under the VHP once the amendment is approved. VHP impact fees paid by Valley Water for impacts on wetlands and aquatic habitats occurring outside of existing PMAs would contribute to the VHP's conservation Program Renewal, which includes wetland creation and restoration to offset impacts of VHP-covered activities and thus would provide compensatory mitigation for wetland impacts. Thus, with the implementation of Program Renewal BMPs and compliance with applicable VHP conditions to avoid and minimize wetland impacts, as well as the payment of VHP impact fees (including specialty fees for impacts to wetlands) to compensate for temporary and permanent impacts to wetlands, temporary and permanent impacts of VHP-covered Program Renewal activities on wetlands are less than significant under CEQA, and no mitigation measures are necessary.

Activities Not Covered under the VHP

Maintenance activities located in tidal portions of the Program Renewal Area would result in temporary and permanent impacts on vegetated wetlands (tidal salt marsh and tidal brackish marsh) and aquatic habitat (tidal and intertidal) and would not be covered under the VHP. For these and other non-VHP-covered activities, implementation of Program Renewal BMPs would avoid and minimize temporary and permanent impacts on wetlands and aquatic habitats in the Program Renewal Area, including impacts due to the destabilization of soils, the permanent conversion of wetlands to open water habitats or weedy areas, the degradation of water quality, excessive erosion and sedimentation, and the compaction of soils.

For temporarily impacted areas, the implementation of BMP REVEG-1 for nontidal wetlands will ensure that temporarily impacted wetlands revegetate following the impact. For tidal salt marsh, the salinity of this habitat typically restricts weed establishment, and thus seeding (as specified in BMP REVEG-1) is not necessary. Thus, with the implementation of BMPs, temporary impacts of non-VHP-covered activities on vegetated wetlands and aquatic habitats are less than significant under CEQA. No mitigation measures are necessary.

The Program Renewal would also result in permanent losses of tidal and non-tidal vegetated wetlands and aquatic habitats due to direct impacts (e.g., from bank stabilization). Impacts to

these habitats would be significant under CEQA, in the absence of mitigation measures, because of their ecological value to a diversity of plant and animal species. Implementation of Mitigation Measure BIO-13 would be implemented to reduce residual permanent Program Renewal impacts on wetlands to a less than significant level.

Mitigation Measure BIO-13: Compensatory Mitigation for Permanent Impacts to Wetlands and Aquatic Habitats

The Program Renewal's compensatory mitigation package, which is detailed in Chapter 10 of the SMP Manual, shall be implemented by Valley Water to compensate for non-VHP-covered permanent new impacts (i.e., impacts that do not fall within an existing PMA for the activity being performed) on wetlands and aquatic habitats. Following the procedure described under "Mitigation Feasibility Assessment, Monitoring, Reporting, and Success Criteria" above and in *Appendix F*, Valley Water would refine the quantification of impacts to wetlands and aquatic habitats that occur during a specific year, tallying the impact totals at the end of the year, and compensatory mitigation will be implemented the following year, in many cases. Exceptions will occur in cases in which compensatory mitigation is incorporated directly into the Program Renewal work areas; in those cases, compensatory mitigation may be implemented during the same year in which impacts occur. Details regarding performance criteria for mitigation, as well as for monitoring and reporting, are described in "Mitigation Feasibility Assessment, Monitoring, Reporting, and Success Criteria" above and in *Appendix F*.

Valley Water will mitigate for permanent impacts to wetlands and aquatic habitats via one or more of the following options:

- Establishing new PMAs for maintenance activities that result in permanent impacts. Mitigation ratios will be 1.5:1 or as determined in a mitigation site plan for nontidal habitats, and 1.2:1 for tidal habitats.
- Use remaining mitigation credits from the Island Ponds (for tidal habitats) and Pajaro Freshwater Wetland (for nontidal habitats) mitigation projects for activities that result in permanent impacts. Mitigation ratios will be 1.5:1 or as determined in a mitigation site plan for nontidal habitats, and 1.2:1 for tidal habitats.
- The removal of concrete from below top of bank, where softscape is left behind in the footprint of the concrete removal work area. Mitigation credit would be calculated based on the area of concrete removed multiplied by 3 for modified channels and unmodified channels.
- For impacts to nontidal wetlands and aquatic habitats, the payment of fees via the Habitat Agency's Voluntary Fee Payments Policy. This option would be subject to consistency with VHP requirements and Habitat Agency approval, and contingent on the Habitat Agency agreeing to use Valley Water's fees to provide mitigation for the resource (e.g., wetlands or aquatic habitats) being affected.

If Valley Water provides the mitigation, Valley Water will conduct monitoring to document that the mitigation is operational and successfully providing the functions and values needed to offset Program Renewal impacts to riparian habitats, as described in detail under "Mitigation Feasibility Assessment, Monitoring, Reporting, and Success Criteria" above and in *Appendix F*. If the Habitat Agency provides the mitigation, the Habitat Agency will conduct any necessary monitoring, and no additional monitoring or documentation is necessary.

It is possible that this mitigation measure may be refined during permitting with the USACE, RWQCB, and CDFW to be equally or more effective, in which case the refinements required by these resource agencies would be implemented.

SUMMARY AND CONCLUSION

With implementation of BMPs, compliance with VHP conditions, and payment of VHP fees, impacts of VHP-covered Program Renewal activities on wetlands and aquatic habitats are less than significant under CEQA, and no mitigation measures are necessary.

Although BMPs would reduce the magnitude and extent of non-VHP-covered Program Renewal impacts on wetlands and aquatic habitats, residual impacts would remain due to the permanent loss of habitat. Mitigation Measure BIO-13 would be implemented to reduce this residual impact to a less-than-significant level.

Impact BIO-4: Interfere substantially with the movement of any native resident or migratory species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites (Significant and Unavoidable)

Impact BIO-4A: Interference with Wildlife Movement (Less than Significant)

IMPACT ASSESSMENT

For many species, the landscape is a mosaic of suitable and unsuitable habitat types. Environmental corridors are segments of land that provide a link between these different habitats while also providing cover. On a broader level, corridors also function as avenues along which wide-ranging animals can travel, plants can propagate, genetic interchange can occur, populations can move in response to environmental changes and natural disasters, and threatened species can be replenished from other areas. In the Program Renewal Area, the vegetation communities along streams and rivers often function as environmental corridors in providing habitat for a variety of resident wildlife species.

Stream maintenance activities could alter these communities and corridors by breaking them into smaller, disjunct pieces, a process known as fragmentation. The impact of fragmentation on wildlife is twofold: first, as habitat patches become smaller they are unable to support as many individuals (patch size); and second, the area between habitat patches may be unsuitable for wildlife species to traverse (connectivity). Program Renewal activities could impact both patch size and connectivity if all vegetation is removed over long reaches of stream channels, or vegetation structure and composition is changed in a way that would create barriers to wildlife movement. By creating open areas or patches with unsuitable vegetation types, maintenance activities could restrict some wildlife species from moving

between distant patches or temporarily eliminate a local population. However, the majority of impacts occurring over the 10-year span of the Program Renewal will be temporary, and located within existing PMAs (i.e., areas where maintenance activities have occurred in the past, and will occur in the future with regular frequency). As a result, Program Renewal impacts within new areas supporting undisturbed plant and wildlife communities will be limited, and the removal of vegetation and/or alteration of vegetation structure over new, long reaches of stream channels will not occur. Thus, the additional incremental impact of Program Renewal activities above and beyond those of SMP-2 will be small and will not result in a significant impact under CEQA.

Because of the urban and agricultural context in which many creeks in the Program Renewal Area occur, the riparian, aquatic, and wetland habitats along these creeks represent the only (or at least highest-quality) habitat available to many species on the Valley floor. As a result, the effects of Program Renewal activities, combined with adverse effects of urbanization and other land uses, could bring about a cumulative impact on habitat connectivity for plants and animals. Program Renewal activities that reduce cover for dispersing individuals, such as the removal of understory vegetation, could inhibit the recolonization of areas from which species have been extirpated for all but the more mobile species (e.g., birds). However, common wildlife species found in certain work locations may be somewhat acclimated to, or may be particularly adaptable to, existing periodic disturbances by maintenance activities that have been ongoing since 2002. In addition, the Program Renewal will help to maintain existing conditions (e.g., emergent wetland vegetation and herbaceous streambank and upland vegetation) in the Program Renewal Area that benefit certain species. Thus, because Program Renewal impacts within new areas supporting undisturbed plant and wildlife communities will be limited; the removal of vegetation and/or alteration of vegetation structure over new, long reaches of stream channels will not occur; and the majority of impacts occurring over the 10-year span of the Program Renewal will be temporary and located within existing PMAs, these impacts are less than significant under CEQA.

BMP ANI-1 specifies the installation of surface barriers (e.g., chain-link fencing, woven geotextiles, and other similar materials) as a method of animal conflict management in areas that may include either the inboard or outboard sides of levees (not both sides) no longer than 300 feet and above the ordinance high water mark. A distance of at least 300 feet would separate each installation. Implementation of this BMP would remove some refugia that would otherwise be used by small animals as they move along levees. Due to the limited extent of these installations and their designated spacing, this impact would be less than significant because the installation of barriers would not remove such large areas of habitat that the movement of wildlife that utilize burrows during movements would be precluded. Wildlife that do not utilize burrows are expected to be able to move over the surface barriers; thus their movements along levees would not be substantially affected.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMPs to avoid and minimize habitat fragmentation impacts:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.

- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities (including wetlands and riparian habitats) are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-15: Prevention of Spread or Mobilization of Pathogens and Invasive Plants** requires measures such as disinfecting gear and cleaning vehicles to avoid the spread or mobilization of pathogens and invasive plants.
- **BMP GEN-21: In-Channel Minor Activities** specifies that in-channel minor activities will be conducted from the top of bank if access is available and if there are flows in the channel.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.
- **BMP GEN-38: Vehicle Cleaning** will ensure that equipment is cleaned to avoid spreading pathogens or exotic/invasive species.

In addition to Valley Water BMPs, VHP-covered Program Renewal activities will comply with the following conditions to avoid and minimize impacts:

- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.
- **Condition 14. Valley Oak and Blue Oak Woodland Avoidance and Minimization** requires projects located on sites supporting substantial stands of valley or blue oak woodland to minimize impacts.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County, and which includes enhancement, protection, and management of wildlife corridors and habitat connectivity on a landscape scale.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

Impacts of VHP-covered activities due to habitat fragmentation and interference with wildlife movement are less than significant under CEQA. VHP impact fees paid by Valley Water for VHP-covered impacts would contribute to the VHP's conservation Program Renewal, which includes conservation and management of lands specifically to maintain and enhance connectivity for wildlife movement, and which supports the conservation, enhancement, and management of lands used by breeding animals, further reducing Program Renewal impacts on wildlife movement. Thus, implementation of Program Renewal BMPs, compliance with VHP conditions, and payment of VHP impact fees will reduce impacts of the Program Renewal due to habitat fragmentation and interference with wildlife movement. No mitigation measures are necessary.

Non-VHP-Covered Activities

Impacts of VHP-covered activities due to habitat fragmentation and interference with wildlife movement are less than significant under CEQA. For non-VHP covered activities, implementation of BMPs would reduce impacts of the Program Renewal due to habitat fragmentation by minimizing the extent of maintenance activities and designing individual activities to result in the least impact to stream channels as practicable. Mitigation Measures BIO-12 and BIO-13 would further reduce these impacts by providing compensatory mitigation for impacts to riparian and wetland habitats. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

The Program Renewal would result in the loss of habitat connectivity for plants and animals, as well as the localized loss of populations of common wildlife species. With implementation of Program Renewal BMPs, these impacts would be less than significant under CEQA, regardless of VHP coverage. No mitigation measures are necessary.

Impact BIO-4B: Interference with the Use of Native Wildlife Nursery Sites (Significant and Unavoidable)

IMPACT ASSESSMENT

Maintenance activities occur regularly adjacent to a great blue heron colony located in cottonwoods along Coyote Creek downstream from Montague Expressway in the Program Renewal Area. Maintenance activities are expected to occur within or adjacent to other rookeries in the Program Renewal Area less frequently. Because heron and egret colonies are located along streams and on reservoirs, maintenance activities can potentially result in direct and indirect impacts on nesting individuals and their habitat.

As described under "Impacts on Common and Special-Status Fish and Wildlife" above, maintenance activities may result in direct and indirect effects on birds in the Program Renewal Area, including herons and egrets, due to direct and indirect disturbance and temporary or permanent impacts on suitable habitat. In the absence of BMPs, individual herons and egrets (especially eggs or young in nests) may be killed or injured during maintenance activities due to physical disturbance of nest trees. Activities causing a

substantial increase in noise or visual disturbance near active nest locations may result in nest abandonment, and possibly the loss of eggs or young as a result. Colonies of herons and egrets are more sensitive to disturbance compared to many other nesting birds, as the distress of individual birds can spread throughout the colony. As a result, disturbance of a colony could potentially result in the loss of large numbers of nests with eggs or young, and possibly failure of those adults to breed in a given year.

If herons and egrets abandon their nests during maintenance activities, they may return to a colony in future years once those activities have completed. However, these species are also known to abandon colonies altogether following disturbance (Bousman 2007g, Bousman 2007h, Bousman and Strong 2007a, and Bousman and Strong 2007b). Herons and egrets do not always establish new colonies immediately or nearby when a colony fails, and they may take several years to find a new nesting location, which may or may not be successful (Bousman 2007g, Bousman 2007h, Bousman and Strong 2007a, and Bousman and Strong 2007b). Because populations of these species in the Program Renewal Area are supported by a small number of nesting colonies, a species' local population can decline due to the permanent dispersal of nesting pairs away from a colony, or lower reproductive success by individuals that relocate from a successful colony to inferior nesting sites (such as sites located farther from high-quality foraging habitat, or where nests are subject to higher predation rates) following disturbance.

Maintenance activities could also result in the permanent loss and/or modification of nesting habitat for these species. The removal or modification of trees and other vegetation supporting heron and egret nests can result in a reduction in the number of nests in a colony (by removing available substrate) or cause one or more pairs of birds to abandon the colony due to the changes in habitat conditions.

Because relatively few active colonies of herons and egrets are present in the Program Renewal Area in a given year, and the loss or substantial reduction in size of a nesting colony as a result of maintenance activities would result in a reduction in regional populations, such impacts would be significant under CEQA.

The Program Renewal would not cause significant impacts to any other important native wildlife nursery sites (i.e., areas where breeding is concentrated, such as a pinniped pupping area or seabird colony). No activities are proposed in pinniped pupping areas or close enough to gull or tern colonies or important shorebird nesting areas to disturb colonies of those species. No nursery sites specific to fish are present within the Program Renewal Area, and no impacts to fish nurseries would occur. Impacts on breeding animals, including breeding colonies of animals (e.g., bat maternity colonies and swallow colonies), may occur as described in Impacts BIO-1V, 1Y, and 1Z above, but no breeding areas for the species addressed in those impacts are so large or regionally important that they rise to the level of an "important native wildlife nursery site". Thus, these impacts are less than significant under CEQA, from the perspective of Impact BIO-4B.

APPLICABLE BEST MANAGEMENT PRACTICES AND VHP CONDITIONS

Valley Water will implement the following BMP to reduce impacts on native wildlife nursery sites (specifically, heron and egret nesting colonies) in the Program Renewal Area:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-6: Protection of Nesting Birds** will ensure that pre-activity surveys are conducted prior to the start of work activities that could impact active nests, and an appropriate non-disturbance buffer is established around active nests until the young have fledged. A 250-foot buffer is prescribed for active nests of herons and egrets.
- **BMP GEN-22: Employee/Contractor Training** will ensure that Valley Water employees and contractors are trained on BMPs, as well as identification and appropriate protective measures for nesting birds.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.

Although VHP-covered Program Renewal activities will comply with applicable VHP conditions, no VHP conditions focus on the protection of the great blue heron, great egret, snowy egret, black-crowned night heron, or their habitat in the Program Renewal Area, as these species are not currently covered under the VHP or listed as fully protected such that VHP Condition 1 would apply.

Valley Water will also pay VHP fees, calculated based on Program Renewal impacts to land cover types, for all VHP-covered activities that require payment of fees. These fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at habitats for native species in Santa Clara County. However, the payment of VHP land cover fees may not have a substantial benefit to the great blue heron, great egret, snowy egret, or black-crowned night heron, as these species are not currently known to make substantive use of Habitat Agency reserves for nesting.

SIGNIFICANCE DETERMINATION AND MITIGATION MEASURES

VHP-Covered Activities

With the implementation of BMPs to avoid disturbance of active nests, impacts of VHP-covered Program Renewal activities on active nests of great blue herons, great egrets, snowy egrets, and black-crowned night herons would be effectively avoided and minimized. No mitigation measures related to disturbance of breeding herons and egrets by breeding-season maintenance activities are necessary.

Residual impacts could remain due to the removal or modification (during the nonbreeding season) of trees and other vegetation supporting active nests within a colony. This could result in a reduction in the number of nests in the colony (by removing substrate supporting existing nests) or cause one or more pairs of birds to abandon the colony due to the changes in habitat conditions. The abandonment of a nesting colony, or a substantial decline in the number of herons and/or egrets using the colony as a result of the Program Renewal (defined as more than 10 percent of the colony size), would result in a substantial adverse effect on the species' populations unless or until a new successful colony is established, because

relatively few active colonies are present in the Program Renewal Area and these species rely on the presence of established colonies for successful breeding. Thus, this impact would be significant under CEQA.

There is no feasible mitigation available to reduce this impact. Valley Water will not remove trees from a heron or egret rookery unless that removal is necessary, so further avoidance of nest trees is infeasible. Because herons and egrets are highly selective about their choice of nesting sites, providing alternative nesting habitat for these species is not expected to be successful. In other locations, efforts to attract nesting herons and egrets to alternative nesting locations using decoys and attractive sound recordings have had variable success. Such efforts have involved great egrets in Louisiana, black-crowned night herons in Tennessee and Long Beach, California, and little blue herons (*Egretta caerulea*) and western cattle-egrets (*Ardea ibis*) in Alabama (Dusi 1985, Crouch et al. 2002). Great blue herons also have been induced to occupy artificial nest platforms in some areas (Ascutney Mountain Audubon Society 2010, Lake County Forest Preserves 2024). In Oakland, an intensive 2-year effort to attract black-crowned night herons and snowy egrets to a new colony location in 2018-2019 was unsuccessful (Lefebvre 2020). It is therefore unlikely that any attempts to mitigate Program Renewal impacts on heron or egret rookeries through habitat modifications or the use of decoys or sound recordings would be successful, and the labor-intensive nature of any such attempts, coupled with the low probability of success, would make such efforts infeasible. Therefore, this impact would be significant and unavoidable.

VHP-covered Program Renewal activities would not cause significant impacts to any other important native wildlife nursery sites (i.e., areas where breeding is concentrated, such as a pinniped pupping area or seabird colony), and no mitigation measures are necessary.

Activities Not Covered under the VHP

With the implementation of BMPs to avoid disturbance of active nests, impacts of non-VHP-covered Program Renewal activities on active nests of great blue herons, great egrets, snowy egrets, and black-crowned night herons would be effectively avoided and minimized. No mitigation measures related to disturbance of breeding herons and egrets by breeding-season maintenance activities are necessary.

Residual impacts could remain due to the removal or modification (during the nonbreeding season) of trees and other vegetation supporting active nests within a colony. This could result in a reduction in the number of nests in the colony (by removing substrate supporting existing nests) or cause one or more pairs of birds to abandon the colony due to the changes in habitat conditions. The abandonment of a nesting colony, or a substantial decline in the number of herons and/or egrets using the colony as a result of the Program Renewal (defined as more than 10 percent of the colony size), would result in a substantial adverse effect on the species' populations unless or until a new successful colony is established, because relatively few active colonies are present in the Program Renewal Area and these species rely on the presence of established colonies for successful breeding. Thus, this impact would be significant under CEQA. However, as discussed for VHP-covered activities, there is no feasible mitigation available to reduce this impact. Therefore, this impact would be significant and unavoidable.

Non-VHP-covered Program Renewal activities would not cause significant impacts to any other important native wildlife nursery sites (i.e., areas where breeding is concentrated, such as a pinniped pupping area or seabird colony), and no mitigation measures are necessary.

SUMMARY AND CONCLUSION

With the implementation of BMPs to avoid disturbance of active nests, impacts of Program Renewal activities on active nests of great blue herons, great egrets, snowy egrets, and black-crowned night herons would be effectively avoided and minimized, regardless of VHP coverage. No mitigation measures related to disturbance of breeding herons and egrets by breeding-season maintenance activities are necessary.

The abandonment of a nesting colony, or a substantial decline in the number of herons and/or egrets using the colony as a result of the Program Renewal (defined as more than 10 percent of the colony size), would result in a substantial adverse effect on the species' populations unless or until a new successful colony is established, because relatively few active colonies are present in the Program Renewal Area and these species rely on the presence of established colonies for successful breeding. Thus, this impact would be significant under CEQA, regardless of VHP coverage. No feasible mitigation to reduce this impact is available; therefore, this impact would be significant and unavoidable.

Program Renewal activities would not cause significant impacts to any other important native wildlife nursery sites (i.e., areas where breeding is concentrated, such as a pinniped pupping area or seabird colony), and no mitigation measures are necessary.

Impact BIO-5: Conflict with Any Local Policies or Ordinances Protecting Biological Resources, such as a Tree Preservation Policy or Ordinance (Less than Significant)[3]

Impact BIO-5: Loss of Ordinance Trees (Less than Significant)

IMPACT ASSESSMENT

For the purpose of this assessment, ordinance trees are defined based on the applicable local ordinance. Often, ordinance trees must meet a minimum size requirement. However, some ordinances are not size-based but species based (e.g., all oaks) and, in some cases, no distinction is made between native and nonnative species. Ordinance-sized trees are common in many of the riparian habitats along the creeks that are maintained by Valley Water, and they are present in some non-instream areas as well. In addition to providing habitat functions and values for common and special-status wildlife species, as described under "Environmental Setting" above, larger trees are particularly valuable because they provide the highest-quality nesting sites for raptors, they may contain cavities that serve as roost sites for bats or nesting/denning sites for other animals, they provide large amounts of coarse

[3] Impact BIO-5 assesses conflicts with local tree ordinances and adopted habitat conservation policies. As mentioned in the regulatory setting, local general plans have policies protecting sensitive biological resources and encouraging habitat restoration. With implementation of BMPs, VHP compliance, and mitigation measures, the previous analyses in this section demonstrate that sensitive biological resources would be sufficiently protected during Program implementation. As such, general conflicts with local general plan policies protecting biological resources are unlikely.

woody debris to the stream ecosystem, and they promote high foliage height diversity, which in turn increases the local diversity of birds. They also provide important shading and aesthetic values. As a result of their high value, such trees are protected by local ordinances of Santa Clara County and a number of municipalities within Valley Water's jurisdiction. Thus, these trees merit special consideration in assessing impacts of the Program Renewal.

Valley Water would remove ordinance-size trees in support of the Program Renewal, and tree removal could occur throughout the Program Renewal Area. Valley Water is exempt from compliance with tree ordinances of Santa Clara County and various cities within the Program Renewal Area either because the ordinance by its terms is not applicable to Valley Water (e.g., it does not apply to tree removal on public property) and/or because of Hall v. Taft (1956) 47 Cal. 2d 177, 189 (which holds that entities operating under mandates set forth by state law, including water districts, are exempt from municipal police power regulation). Therefore, Valley Water's removal of ordinance-sized trees would not conflict with any local tree ordinance, and this impact is less than significant under CEQA. Nevertheless, recognizing the importance of protected trees, Valley Water will compensate for tree removal where required within the riparian habitat. See Impact BIO-2A for discussion on impacts to riparian vegetation, including riparian tree removal, and measures that would compensate for impacts to riparian vegetation (e.g., payment of VHP fees and implementation of Mitigation Measure BIO-11 for non-VHP-covered Program Renewal impacts).

Applicable Best Management Practices

Valley Water will implement the following BMPs to avoid and minimize impacts on the ordinance-size trees in the Program Renewal Area:

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of soil disturbance is kept to the minimum area necessary to complete the maintenance work.
- **BMP GEN-8: Avoid and/or Minimize Impacts to Special-Status Plant Species and Sensitive Natural Vegetation Communities** will ensure that sensitive communities are identified and disturbance within these areas is avoided and/or minimized.
- **BMP GEN-26: Staging and Stockpiling of Materials** incorporates measures to minimize impacts on natural habitat areas due to staging and stockpiling of materials, including locating staging areas in previously disturbed areas and incorporating erosion control measures during the wet season.
- **BMP GEN-28: Stream Access** ensures that existing access routes are used to the extent feasible, and temporary access routes are constructed in a manner that minimizes impacts.

No VHP conditions apply to compliance with local ordinances.

Significance Determination and Mitigation Measures

As discussed under "Regulatory Setting" and in *Appendix C*, Valley Water is exempt from compliance with tree ordinances of Santa Clara County and various cities within the Program Renewal Area. Therefore, Valley Water's removal of ordinance-sized trees would not conflict with any local tree ordinance, and this impact is less than significant under CEQA. Nevertheless, recognizing the importance of protected trees, Valley Water will compensate

for tree removal where required within the riparian habitat. No mitigation measures are necessary.

SUMMARY AND CONCLUSION

Valley Water would remove ordinance-size trees in support of the Program Renewal, and tree removal could occur throughout the Program Renewal Area. Valley Water is exempt from compliance with tree ordinances of Santa Clara County and various cities within the Program Renewal Area . Therefore, Valley Water's removal of ordinance-sized trees would not conflict with any local tree ordinance, and this impact is less than significant under CEQA. Nevertheless, recognizing the importance of protected trees, Valley Water will compensate for tree removal where required within the riparian habitat. See Impact BIO-2A for discussion on impacts to riparian vegetation, including riparian trees removal, and measures that would compensate for impacts to riparian vegetation, e.g., payment of VHP fees, and implementation of Mitigation Measure BIO-11 for non-VHP covered Program Renewal impacts.

Impact BIO-6: Conflict with the Provisions of an Adopted Habitat Conservation Plan, Natural Community Conservation Plan, or Other Approved Local, Regional or State Habitat Conservation Plan (Less than Significant)

Impact BIO-6: Conflict with an Adopted Habitat Conservation Plan (Less than Significant)

IMPACT ASSESSMENT

Valley Water is a co-permittee under the VHP, which is an HCP and NCCP. Most of the Program Renewal Area is currently located within the VHP permit area (ICF International 2012). Under an amendment that is expected to be considered for approval in 2026, the VHP permit area would be expanded so that it will include the majority of Program Renewal activities. At that time, Valley Water will comply with all applicable VHP conditions for VHP-covered Program Renewal activities.

All VHP-covered species that may be impacted by the Program Renewal are discussed in this analysis. Similarly, impacts on sensitive habitats, such as stream and serpentine habitats for which the VHP requires specialty impact fees, are discussed in this analysis.

Once the VHP is amended, the Program Renewal will adhere to all applicable VHP conditions and pay applicable VHP fees during maintenance activities, as discussed above. Conditions applicable to the Program Renewal include Conditions 1 (avoid direct impacts to legally protected plant and wildlife species), 3 (maintain hydrologic conditions and protect water quality), 5 (avoidance and minimization for instream operations and maintenance), 12 (wetland and pond avoidance and minimization), 13 (serpentine and associated covered species avoidance and minimization), 15 (western burrowing owl), 16 (least Bell's vireo), 17 (tricolored blackbird), 18 (San Joaquin kit fox), 19 (plant salvage when impacts are unavoidable), and 20 (avoid and minimize impacts to covered plant occurrences). Therefore, once the VHP is amended, the Program Renewal would not be in conflict with the VHP.

Before the VHP is amended, if residual impacts from maintenance activities remain significant under CEQA with the implementation of Valley Water's BMPs, Valley Water will

provide compensatory mitigation for impacts on biological resources, as discussed under *Mitigation Approach* above. Therefore, before the VHP is amended, the Program Renewal would not be in conflict with the VHP.

No other adopted HCPs or NCCPs, or any other approved local, regional, or state HCPs or NCCPs, apply to the Program Renewal.

Five other HCPs have been approved in Santa Clara County (USFWS 2024):

- PG&E Bay Area Operations and Maintenance HCP
- Permanente Site Operations and Maintenance Low-Effect HCP
- Stanford University HCP
- Los Esteros Critical Energy Facility Low-Effect HCP
- Donald Von Raesfeld Power Plant Low-Effect HCP

The Program Renewal does not include any activities that conflict with these HCPs. Aside from the VHP, no NCCPs in Santa Clara County have been approved or are in preparation (CDFW 2024b).

Applicable BMPs and VHP Conditions

No BMPs apply to ensure Program Renewal consistency with HCPs. VHP-covered Program Renewal activities will comply with applicable VHP conditions, as follows:

- **Condition 1. Avoid Direct Impacts on Legally Protected Plant and Wildlife Species** requires Valley Water to ensure that measures are implemented to avoid direct impacts on state and federally listed species.
- **Condition 3. Maintain Hydrologic Conditions and Protect Water Quality** includes measures (listed in Table 6-2 of the VHP) to minimize hydrology-related impacts on water quality and aquatic habitat.
- **Condition 5. Avoidance and Minimization for In-Stream Operations and Maintenance** includes measures (listed in Table 6-2 of the VHP) to minimize impacts on aquatic and riparian land cover types.
- **Condition 12. Wetland and Pond Avoidance and Minimization** includes measures to ensure that covered projects avoid and minimize impacts on wetlands and ponds, including minimizing erosion and new runoff.
- **Condition 13. Serpentine and Associated Covered Species Avoidance and Minimization** will help to avoid and minimize Program Renewal impacts on serpentine habitats and associated special-status plants.
- **Condition 15. Burrowing Owl** requires habitat surveys and preconstruction surveys for burrowing owls within mapped survey areas, as well as avoidance measures to protect individuals.
- **Condition 16. Least Bell's Vireo** requires all covered projects within mapped survey areas for this species to conduct habitat surveys and preconstruction surveys and implement avoidance and minimization measures to protect active nests.

- **Condition 17. Tricolored Blackbird** requires habitat surveys and preconstruction surveys for nesting tricolored blackbirds, as well as appropriate avoidance and minimization measures and construction monitoring to protect nesting colonies.
- **Condition 18. San Joaquin Kit Fox** requires habitat surveys, preconstruction surveys, and avoidance of occupied dens to avoid all injury to or death of kit foxes, and to minimize harm or harassment.
- **Condition 19. Plant Salvage when Impacts Are Unavoidable** gives the Habitat Agency the option to salvage seed from VHP-covered special-status plants when impacts cannot be avoided.
- **Condition 20. Avoid and Minimize Impacts to Covered Plant Occurrences** requires pre-activity surveys for VHP-covered special-status plant species and revision of the activity design to avoid impacts, if feasible.

For VHP-covered activities, the species protection measures provided in VHP conditions will replace the protections outlined in Valley Water BMPs, where applicable.

Valley Water would also pay VHP land cover fees and specialty fees for VHP-covered impacts on habitats in the Program Renewal Area; these fees would contribute to the VHP's conservation Program Renewal, which includes habitat acquisition, restoration, preservation, and management targeted at those habitats.

Significance Determination and Mitigation Measures

With VHP compliance for VHP-covered activities, impacts associated with conflicts between the Program Renewal and any adopted HCP or NCCP plan are less than significant. No mitigation measures are necessary.

Conclusion

The Program Renewal would not conflict with any adopted HCPs or NCCPs, or with any other approved local, regional, or state HCPs. VHP-covered Program Renewal activities will comply with applicable VHP conditions and pay VHP fees for impacts on habitats in the Program Renewal Area. Thus, any Program Renewal impacts associated with conflicts between the Program Renewal and any adopted HCP or NCCP would be less than significant. No mitigation measures are necessary.

3.5 Cultural and Paleontological Resources

3.5.1 Introduction

This section presents the regulatory setting, environmental setting, and potential impacts of Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal) as related to cultural resources and paleontological resources.

Cultural resources are the remains and sites associated with human activities and include pre-contact and ethnographic Native American archaeological sites, historic-era archaeological sites, historic buildings, and elements or areas of the natural landscape which have traditional cultural significance. Pre-contact, ethnographic, and historic-era districts that include multiple features and components are also considered as cultural resources.

Paleontological resources include the fossilized remains of vertebrate and invertebrate organisms, fossilized tracks, and plant fossils. An update of the CEQA Guidelines that was approved in 2018 moved the criteria discussing paleontological resources to the "Geology and Soils" section of the Appendix G checklist. However, the Geology and Soils section has been scoped out of this Subsequent Environmental Impact Report (SEIR) (see Section 3.1, "Environmental Setting and Impact Analysis," in Chapter 3), and therefore paleontological resources are analyzed in this section of the SEIR.

As described in Chapter 1, "Introduction," public comments were received during the scoping period (refer to **Appendix B**) and were considered in preparing this Draft SEIR. Scoping comments applicable to the cultural resources analysis included a letter from the Native American Heritage Commission (NAHC). The NAHC provided a summary of the requirements of the Public Resources Code Sections regarding Assembly Bill 52, including provisions for consideration of tribal cultural resources and consultation with California Native American tribes. The comments also included recommendations for a cultural resources assessment, including conducting appropriate background research and an archaeological inventory survey, if required. The cultural resources analysis presented herein provides an assessment of the potential for cultural resources that could be present within the Program Renewal Area and the associated impacts, which address the NAHC comment letter.

Study Area

The study area for the cultural resources and paleontological resources assessment is a 1-mile radius from Program Renewal Area channels, access roads, and other features under the maintenance authority of the Valley Water. The study area was used to help determine general areas of sensitivity and types of resources in the Program Renewal Area, which is discussed in Section 3.5.3, "Environmental Setting."

Program Renewal Area

The Program Renewal Area includes channels, access roads, and other features maintained by Valley Water that require activities outlined in the Stream Maintenance Program (SMP) Manual (provided in Appendix A) such as sediment removal, vegetation management, bank stabilization, management of animal conflicts, minor maintenance (e.g., fence installation and repair, trash and debris removal), and large woody debris management. If present, many previously identified cultural resources or paleontological resources located within an

activity area would indicate an elevated level of sensitivity, suggesting increased likelihood that Program Renewal activities could cause adverse impacts to significant cultural or paleontological resources.

3.5.2 Regulatory Setting

The following subsections discuss federal and state laws and regulations that pertain to cultural resources for the Program Renewal. Applicable regional and local plans, policies, regulations, or ordinances related to cultural resources are presented in Appendix C, *General Plan Policies and Ordinances*. The plans and policies in Appendix C provide for the inventory and evaluation of cultural resources in order to minimize adverse impacts as well as restore, enhance, and commemorate resources, as appropriate.

Federal Plans, Policies, Regulations, and Laws

National Historic Preservation Act/Section 106

The National Historic Preservation Act (NHPA) of 1966, as amended, requires federal agencies to consider the preservation of historic and pre-contact indigenous resources. The NHPA authorizes the Secretary of the Interior to expand and maintain a National Record of Historic Places (National Register), and it has established an Advisory Council on Historic Preservation (ACHP) as an independent federal entity. Section 106 of the Act requires federal agencies to take into account the effects of their undertakings on historic properties and afford the ACHP a reasonable opportunity to comment on the undertaking before licensing or approving the expenditure of funds on any undertaking that may affect properties listed, or eligible for listing, in the National Register.

Federal review of projects is normally referred to as the Section 106 process. The Section 106 review normally involves a four-step procedure described in detail in the implementing regulations (Title 36, Code of Federal Regulations [CFR], Part 800):

- identify and evaluate historic properties in consultation with the State Historic Preservation Officer (SHPO) and interested parties;
- assess the effects of the undertaking on properties that are eligible for inclusion in the National Register;
- consult with the SHPO, other agencies, and interested parties to develop an agreement that addresses the treatment of historic properties and notify the ACHP; and
- proceed with the project according to the conditions of the agreement.

National Environmental Policy Act

The National Environmental Policy Act of 1969 (NEPA) requires federal agencies to foster environmental quality and preservation. Section 101(b)(4) declares that one objective of the national environmental policy is to "preserve important historic, cultural, and natural aspects of our national heritage...." For any major federal actions significantly affecting environmental quality, federal agencies must prepare, and make available for public comment, an environmental impact statement.

Advisory Council of Historic Preservation Regulations

The Advisory Council of Historic Preservation (ACHP) Regulations, Protection of Historic Properties (36 CFR 800) establish procedures for compliance with Section 106 of the NHPA. These regulations define the criteria of adverse effect, define the role of the SHPO in the Section 106 review process, set forth documentation requirements, and describe procedures to be followed if significant historic properties are discovered during implementation of an undertaking. Pre-contact indigenous and historic resources deemed significant (i.e., eligible for listing in the National Register, per 36 CFR 60.4) must be considered in project planning and construction. The responsible federal agency must submit any proposed undertaking that may affect National Register-eligible properties to the SHPO for review and comment before the project's approval.

National Park Service Regulations, National Register of Historic Places

The National Park Service Regulations (36 CFR 60) set forth procedures for nominating properties to the National Register and present the criteria to be applied in evaluating the eligibility of historic and pre-contact resources for listing in the National Register.

Archaeology and Historic Preservation: Secretary of the Interior's Standards and Guidelines

Archaeology and Historic Preservation: Secretary of the Interior's Standards and Guidelines (Federal Register [FR] 190:44716–44742) offer non-regulatory technical advice about the identification, evaluation, documentation, study, and other treatment of cultural resources. Notable in these guidelines are the "Standards for Archaeological Documentation" (p. 44734) and "Professional Qualifications Standards for Archeology" (pp. 44740–44741).

Section 106 of the NHPA prescribes (at 36 CFR Section 800.5) specific criteria for determining whether a project would have an adverse effect on a historic property, if any such properties exist in the area of potential effects, as defined by the agency. An impact is considered adverse when pre-contact or historic archaeological sites, structures, districts, or objects listed in or eligible for listing in the National Register are subjected to the following effects:

- physical destruction of or damage to all or part of the property;
- alteration of a property;
- removal of the property from its historic location;
- change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
- introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features;
- neglect of a property that causes its deterioration; and
- transfer, lease, or sale of the property.

Because Valley Water would need to obtain a permit from the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA) for certain activities, the Program

Renewal constitutes a federal undertaking that would require compliance with Section 106 of the NHPA, and federal significance criteria apply. For federally permitted or funded projects, cultural resource significance is evaluated in terms of eligibility for listing in the National Register. National Register criteria for eligibility are defined as follows:

> The quality of significance in American history, architecture, archeology, and culture is present in districts, sites, buildings, structures, and objects of state and local importance that possess integrity of location, design, setting, materials, workmanship, feeling and association, and that:
>
> - are associated with events that have made a contribution to the broad pattern of our history;
> - are associated with the lives of people significant in our past;
> - embody the distinct characteristics of a type, period, or method of construction, that represent the work of a master, that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
> - have yielded, or are likely to yield, information important in prehistory or history.

State Plans, Policies, Regulations, and Laws

California implements the NHPA through its statewide comprehensive cultural resource surveys and preservation programs. The California Office of Historic Preservation (OHP), an office of the California Department of Parks and Recreation, implements the policies of the NHPA on a statewide level. The OHP also maintains the California Historical Resources Inventory. The SHPO is an appointed official who implements historic preservation programs within the state's jurisdictions as well as serving as a consulting party in the federal process described above.

California Register of Historical Resources

The California Register of Historical Resources (California Register) is "an authoritative listing and guide to be used by state and local agencies, private groups, and citizens in identifying the existing historical resources of the state and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change" (Public Resources Code [Pub. Res. Code] Section 5024.1[a]). The eligibility criteria for inclusion on the California Register are based on National Register criteria (Pub. Res. Code Section 5024.1[b]). Certain resources are determined by the statute to be automatically included in the California Register, including California resources formally determined eligible for, or listed in, the National Register.

To be eligible for the California Register, a pre-contact or historic-era resource must be significant at the local, state, and/or federal level under one or more of the following criteria:

- it is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- it is associated with the lives of persons important in our past;

- it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or,
- it has yielded, or may be likely to yield, information important in prehistory or history.

For a resource to be eligible for the California Register, it must also retain enough of its character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. A historic resource that does not retain sufficient integrity to meet the National Register criteria may still be eligible for listing in the California Register.

The California Register consists of resources that are listed automatically as well as those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- Resources listed on the National Register and those formally determined to be eligible for the National Register;
- California Historical Landmarks from No. 770 onward; and
- California Points of Historical Interest that have been evaluated by the OHP and have been recommended to the State Historical Resources Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include the following:

- Historical resources with a significance rating of Category 3 through 5 (i.e., resources identified as eligible for listing in the National Register, the California Register, and/or a register maintained by a local jurisdiction);
- Individual historical resources;
- Historical resources contributing to historic districts; or
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as a historic preservation overlay zone.

California Environmental Quality Act

The California Environmental Quality Act (CEQA), as codified at Pub. Res. Code Sections 21000 et seq., requires lead agencies to determine if a project would have a significant effect on archaeological resources and historic structures.

A substantial adverse change in the significance of an "historical resource" may be a significant effect under CEQA. CEQA Guidelines Section15064(b). The CEQA Guidelines define an "historical resource" as: (1) a resource in the California Register; (2) a resource included in a local register of historical resources, as defined in Pub. Res. Code Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of Pub. Res. Code Section 5024.1(g); or (3) any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant or significant in the

architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California, provided the lead agency's determination is supported by substantial evidence in light of the whole record. "Historical resources" include both archaeological resources and historic structures. A "substantial adverse change" in the significance of a historical resource means an effect on the resource or its immediate surroundings such that its significance is materially impaired.

CEQA Guidelines Section 15126.4(b)(3) provides rules for mitigating impacts on historical resources of an archeological nature. Agencies are encouraged to avoid damaging effects whenever feasible, with preservation in place as the preferred mitigation technique. When preservation is not feasible and data recovery through excavation is the only feasible mitigation technique, in most circumstances a data recovery plan must be adopted before excavation and filed with the California Historical Resources Regional Information Center.

In addition, regarding archaeological sites, as defined in Pub. Res. Code Section 21083.2, a "unique" archaeological resource is an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information;
- Has a special and particular quality such as being the oldest of its type or the best available example of its type; and
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If a lead agency determines that an archaeological site is a historical resource, the provisions of Pub. Res. Code Section 21084.1 and CEQA Guidelines Section 15064.5 would apply. If an archaeological site does not meet the CEQA Guidelines criteria for a historical resource, then the site is to be treated in accordance with the provisions of Pub. Res. Code Section 21083 regarding unique archaeological resources. The CEQA Guidelines note that if a resource is neither a unique archaeological resource nor a historical resource, the effects of a project on that resource shall not be considered a significant effect on the environment (CEQA Guidelines Section 15064[c][4]).

California Public Resources Code and Health and Safety Code

Human remains, including those buried outside of formal cemeteries, are protected under several state laws, including Pub. Res. Code Section 5097.98 and Health and Safety Code Section 7050.5. Pub. Res. Code Section 5097.98 provides procedures in the event human remains of Native American origin are discovered during project implementation, including no further disturbances in the immediate vicinity of the discovery and that the NAHC, upon notification by a County Coroner, designate and notify a Most Likely Descendant (MLD).

Health and Safety Code Section 7050.5 protects human remains by prohibiting the disinterring, disturbing, or removing of human remains from any location other than a dedicated cemetery.

3.5.3 Environmental Setting

This environmental setting discussion is divided into three sections: the first section summarizes the natural and cultural history of the Santa Clara Valley region; the second section discusses previous cultural resources surveys and assessments in the Program Renewal Area; and the third section describes the types of cultural resources that could be encountered in the Program Renewal Area.

Natural and Cultural History

Natural Environment

The Program Renewal Area contains an abundance of natural resources that would have been taken advantage of by its indigenous and early historic-era populations. The South Bay area hosts a wide variety of natural communities including salt marsh, scrub brush, grassland, and foothill woodlands. Deer, elk, and waterfowl were plentiful prior to European expansion, as were marine and bay resources such as seals, otters, abalone, mussels, oysters, clams, and numerous fish species. Chinook salmon were seasonally present and historically Coho salmon were also common in San Francisco Bay. Franciscan chert was an easily obtainable local raw material for stone tools. Obsidian for tools could be obtained from quarries to the north (Moratto 1984).

The San Francisco Bay Area, including the Santa Clara Valley, has undergone dramatic landscape changes since humans began to inhabit the region more than 13,000 years ago. Sea levels began rising around 15,000 years ago, at which time the coastline was located west of the Farallon Islands and reached the present level of the bay about 5,000 years ago (Helley and Graymer 1997).

This dramatic change in stream base level resulted in increased deposition of sediment along the lower reaches of Bay Area streams; this was particularly exacerbated during the Gold Rush in the north bay. In many places, the interface between older land surfaces and newer stream deposits (those less than 5,000 years old) is marked by a well-developed buried soil profile, or a paleosol. Paleosols preserve the composition and character of the earth's surface before subsequent sediment deposition; thus, paleosols have the potential to preserve cultural materials and features if the area was occupied or settled by humans.

Because human populations have grown since the arrival of the area's first inhabitants, younger paleosols (late Holocene) are more likely to yield cultural materials and features than older paleosols (early Holocene or late Pleistocene). Numerous deeply buried archaeological sites have been uncovered in the Santa Clara Valley, at depths varying between 1 foot and more than 10 feet below ground surface (bgs). In fact, more than 60 percent of recorded archaeological sites in this region have been found in a buried context (Meyer and Rosenthal 2007).

Pre-contact Background

Categorizing the pre-contact period into cultural stages allows researchers to describe a broad range of cultural resources with similar patterns and components during a given time frame, thereby creating a regional chronology. Milliken et al. (2007) provided a framework for interpreting the San Francisco Bay Area in four periods: the Paleoindian Period, the Early

Period, the Middle Period, and the Late Period. Economic patterns, stylistic aspects, and regional phases further subdivide these periods into shorter phases. This framework uses economic and technological types, socio-politics, trade networks, population density, and variations of artifact types to differentiate between cultural periods.

The Paleoindian Period (11500–8000 B.C.) was characterized by big-game hunters occupying broad geographic areas. Evidence of human habitation during the Paleoindian Period has not yet been discovered in the San Francisco Bay Area.

During the Early Period (Lower Archaic; 8000–3500 B.C.), geographic mobility continued from the Paleoindian Period and is characterized by the milling slab and handstone, and by large wide-stemmed and leaf-shaped projectile points. The first cut shell beads and the mortar and pestle are documented in burials during the Early Period (Middle Archaic; 3500–500 B.C.), indicating the beginning of a shift away from mobility to a practice of remaining in one location over time. Early Period human populations are known from several Bay Area sites, such as those at the Los Vaqueros Reservoir (CA-CCO-696) and in the Santa Clara Valley in Santa Teresa (CA-SCL-178).

Middle Period sites are more widespread in the San Francisco Bay Area and are evidenced by substantial settlements, isolated burials, distinct cemeteries, milling slabs, mortars and pestles, and the fabrication and use of shell beads and other ornaments. During the Middle Period—which consists of the Lower Middle Period (Initial Upper Archaic; 500 B.C.–A.D. 430) and Upper Middle Period (Late Upper Archaic; A.D. 430–1050)—geographic mobility may have continued, although groups began to establish longer term base camps in localities from which a more diverse range of resources could be exploited. The first rich black middens are recorded from this period. A more diverse economic base is suggested by the addition of new milling tools, obsidian and chert concave-base projectile points, and the occurrence of sites in a wider range of environments. By the Upper Middle Period, mobility was being replaced by the development of numerous small villages. Around 1370 B.C. a cultural disruption occurred, evidenced by the sudden collapse of a trade network in beads.

The Late Period has left the most comprehensive archaeological record of indigenous populations in San Francisco Bay Area. During the Initial Late Period (Lower Emergent; A.D. 1050–1650), social complexity developed toward lifeways of large, central villages with resident political leaders and specialized activity sites, which are locations where archaeological sites may be discovered. Artifacts associated with the period include the bow and arrow, small corner-notched projectile points, and a diversity of beads and ornaments.

Ethnohistoric Background

Based on a compilation of ethnographic, historic, and archaeological data, Milliken (1995) describes a group known as the Ohlone, who once occupied the general vicinity of the Program Renewal Area. Although traditional anthropological literature portrayed the Ohlone peoples as having a static culture, today it is better understood that many variations of culture and ideology existed within and between villages. While these static descriptions of separations between native cultures of California make it easier for ethnographers to describe past behaviors, this masks Native adaptability and self-identity. California's Native Americans never saw themselves as members of larger cultural groups, as described by some anthropologists. Instead, they saw themselves as members of specific villages, perhaps

related to others by marriage or kinship ties, but viewing the village as the primary identifier of their origins.

Levy (1978) describes the language group spoken by the Ohlone, known as "Costanoan." This term is originally derived from a Spanish word designating the coastal peoples of Central California. Today "Costanoan" is used as a linguistic term that refers to a larger language family spoken by distinct sociopolitical groups that spoke at least eight languages (as different as Spanish is from French) of the same Penutian (also called *Yok-Utian*) language group. The Ohlone once occupied a large territory from San Francisco Bay in the north to the Big Sur and the Salinas Rivers in the south.

Economically, Ohlone engaged in hunting and gathering. Their territory encompassed both coastal and open valley environments, which contained a wide variety of resources, including grass seeds, acorns, bulbs and tubers, bear, deer, elk, antelope, a variety of bird species, rabbit, and other small mammals. The Ohlone acknowledged private ownership of goods and songs, and village ownership of rights to land and/or natural resources; they aggressively protected their village territories, requiring monetary payment for access rights in the form of clamshell beads.

By the mid-1800s, Spanish missionization, diseases, raids by Mexican slave traders, and dense immigrant settlement had disrupted Ohlone culture, dramatically reducing the population, and displacing the native people from their villages and land-based resources. Reduction of Ohlone villages, conversion to Catholicism, and exposure to Spanish language, culture and material practices commenced with the establishment of Mission Santa Clara in early 1777 and the settlement of San Jose in the same year (Milliken 1995). The majority of Ohlone who joined Mission Santa Clara during the mid-1790s resided at seven main villages in the Santa Clara Valley, four of which probably contained more than 100 inhabitants (Milliken 2007). Milliken estimates by 1800, most native residents of the Santa Clara Valley had experienced severe psychological depression from the spread of epidemic diseases and witnessed environmental deterioration resulting from introduced grazing and farming practices. Spanish missions further eroded native cultural, social, and economic institutions, resulting in the elimination of perhaps 80 percent of native residents in the Bay Area.

Although the Ohlone lost their original land base because of Spanish missionizing efforts, rancho allotments, and legal obstacles preventing favorable rulings in U.S. courts, modern-day Ohlone representatives still have a strong presence in the San Francisco Bay Area and are highly interested in their historic and pre-contact past. Section 3.13, "Tribal Cultural Resources," provides details on the tribal outreach completed by Valley Water for the Program Renewal and other Valley Water programs.

Historic-Era Background

The first mention of the Ohlone in historical records comes from the 1542 account of Juan Rodriquez Cabrillo, who sailed into Monterey Bay and observed some of California's native residents. Over 200 years later, an expeditionary force under the direction of Captain Gaspar de Portola traversed Ohlone lands on their way to the East Bay. After 1770, when the presidio of Monterey and Mission San Carlos Boromeo were founded, additional expeditions reached the South San Francisco Bay Area. For example, a 1776 expedition headed by Juan Bautista de Anza reached the Guadalupe River and possibly crossed near Tamien Station in search of suitable locations for additional Spanish settlements (Hylkema 2007). At this time, Anza

observed "the plains surrounding the Guadalupe River maintained large numbers of villages with a thriving Native American population" (Hylkema 2007:35). For this reason, Mission Santa Clara was established in 1777 and named *Santa Clara de Thamien*. The pueblo of *San Jose de Guadalupe* (San Jose Pueblo) was established later that year on the east side of the Guadalupe River. Flooding of the Guadalupe River in 1779 resulted in the relocation of the mission and it was renamed *Misión Santa Clara de Asís*. After 1803, the area around Mission Santa Clara was designated as a rancho and used as pasture for livestock (Hylkema 2007:38).

With the establishment of the independent government of Mexico in 1821, Spanish missions were eventually secularized, and former mission lands typically were allotted to wealthy Mexican citizens. Fifty grants of land were made in what is now Santa Clara County (Kyle 1990:404–411). These land grants included the following:

- *Rancho San Ysidro* (Old Gilroy)
- *Rancho Los Tularcitos* (Milpitas)
- *Rancho Milpitas* (Milpitas)
- *Rancho Ulistac* (Agnew)
- *Rancho Patoría de las Borregas* (Mountain View and Sunnyvale)
- *Rancho Rincón de San Francisquito* (Palo Alto)
- *Rancho Rinconada del Arroyo de San Francisquito* (Palo Alto)
- *Rancho San Francisquito* (Stanford University)
- *Rancho San Antonio* (Los Altos)
- *Rancho Purísima Concepción* (Los Altos Hills)
- *Rancho Quito* (Saratoga)
- *Rancho Rinconada de los Gatos* (Los Gatos)
- *Rancho Santa Teresa* (San Jose)
- *Rancho El Potrero de Santa Clara* (San Jose)
- *Rancho Los Coches* (San Jose)
- *Rancho Las Animas* (Southern Santa Clara County)
- *Rancho Ojo de Agua de la Coche* (Morgan Hill)
- *Rancho Cañada de Pala* (eastern Santa Clara County)

The Peralta Adobe, constructed in 1777 and the oldest building in San Jose, was located in *Rancho San Antonio*. One rancho—*Rancho Polsomi*—contains several pre-contact indigenous shell mounds and was granted to an Ohlone Indian, Lope Ínigo, who chose to be buried in one mound after his death in 1864.

Under Mexican law, settlement by non-Mexican citizens was permissible and soon immigrants from the U.S. settled in the Bay Area, although they often illegally squatted on rancho lands. Following the end of the Mexican American War in 1848, California was admitted to the Union (1850), becoming the 31st state. For Mexican landowners, most of their property was subsequently lost to American settlers. Several present-day towns in Santa

Clara County emerged from disbursed Mexican lands: Gilroy, Los Gatos, Milpitas, San Jose, and Santa Clara (Gudde 1969).

As the American Period began, an influx of new economies resulted in an increase in settlement and the development of farming, ranching, industry, and businesses in Santa Clara County. Santa Clara Valley's agricultural productivity was accelerated by immigrants—especially of Italian origin—who arrived en masse to Santa Clara County around 1870 and became involved in one of the most productive fruit growing and distribution regions in the U.S. (Hylkema 2007:42). Improved agricultural productivity was also spurred on by technological innovations for irrigating crops and orchards. By 1919, at least ten fruit and vegetable canning plants were operating in Santa Clara County; the region's fruit packing industry peaked in the 1930s with 30 packing plants operating in the county. During World War II, the Bay Area experienced rapid growth, primarily due to shipbuilding and related industries in the San Francisco Bay. After the booming agricultural economy of the 1930s and the influx of population during World War II, Santa Clara County focused on technology with the founding of Hewlett Packard and Fairchild Semiconductor in the late 1950s. The area is now synonymous with the term "Silicon Valley," and is the location of several of the world's leading computer, microprocessor, and internet companies.

In the 1920s, persistent flooding, growing communities, and agricultural productivity in Santa Clara County led farmers and community leaders to petition for the creation of a water conservation committee for controlling and managing the valley's water resources. At that time, the Santa Clara Valley Water Conservation Committee was formed, and it subsequently spearheaded the establishment of the Santa Clara Valley Water Conservation District in 1929. Since that time, reservoirs have been constructed to alleviate problems associated with periodic droughts and to slow rapidly dropping groundwater levels. In 1952, the County Board of Supervisors formed the Santa Clara County Flood Control and Water Conservation District. In the 1970s, the Santa Clara County Flood Control District changed its name to the Santa Clara Valley Water District, with responsibilities for providing water supply and flood protection.

Previous Cultural Resource Surveys

As part of the mitigation requirements for SMP-1, pre-construction surveys and assessments of areas surrounding proposed maintenance activity areas were conducted from 2002–2011 by California Department of Parks and Recreation (State Parks) Archaeologist Mark Hylkema. Evaluations were based on the results of record and archival searches conducted at the Northwest Information Center of the California Historical Resources Information System (CHRIS) at Sonoma State University and augmented by data retained by State Parks. Cultural resource monitoring by a qualified archaeologist was recommended in areas where the removal of sediment within existing stream profiles was proposed and/or areas near known cultural resources that were deemed potentially sensitive.

A monitoring program was implemented for SMP-1 by Albion Environmental, Inc. (2002, 2003) and by Pacific Legacy, Inc. (2004, 2005, 2006, 2007, 2008, 2009, 2010), for those locations deemed potentially sensitive. Cultural resource monitors were required for ground-disturbing activities such as vegetation removal, silt or sediment removal, the removal of previously installed stream maintenance features (such as concrete riprap or tailings), the installation of bank protection features (such as rock weirs or retaining walls), and stream channel widening or rerouting. Historic or temporally indeterminate debris was noted at

many of the locations that were monitored; however, most of these items were observed in transposed secondary contexts and few yielded in situ cultural materials. Exceptions included a historic debris scatter discovered along Permanente Creek, an isolated boulder mortar found along Alamitos Creek at Bubblingwell Place, and in situ human remains recovered from Adobe Creek. All in situ discoveries were recorded and documented. Only one inadvertent discovery was recorded under SMP-1: a historic-era barge found in the Alviso Slough in 2010. The resource was documented according to the standards of the Historic American Engineering Record and monitored during ground-disturbing activities.

For SMP-2, Pacific Legacy, Inc. completed cultural resources identification efforts and monitoring programs during 2017–2021 (Pacific Legacy 2018a, 2018b, 2019, 2021a, 2021b, 2021c, 2021d). Ground-disturbing activities for which studies were required were similar to those identified in SMP-1. In addition, Valley Water requested several non-confidential records searches from the CHRIS to determine if additional cultural resources analysis was warranted at specific project locations. No significant cultural materials or sites were identified during the programs. Pacific Legacy, Inc. also developed a training module, *Cultural Resources Awareness Training for the Santa Clara Valley Water District, Stream Maintenance Program Unit*, which outlined protocols to follow in the event that buried pre-contact and/or historic-era cultural remains are encountered (Pacific Legacy 2018c).

Background Research for the Program Renewal

For the Program Renewal, a records search was completed at the CHRIS on January 16, 2025 (File No. 24-1016). The results of the records search indicate that there approximately 160 previously documented cultural resources in the immediate vicinity of the Program Renewal Area. The records search included reviews of the base maps for the Program Renewal Area as well as a 20-foot radius, and a included a review of the National Register, the California Register, and the Built Environment Resource Directory for Santa Clara County.

Pre-contact Indigenous Property Types

Based on the location and constituents of other pre-contact sites in the Santa Clara Valley in similar environmental settings, the Program Renewal Area has a high sensitivity for containing important pre-contact indigenous property types. Seven pre-contact property types that might be encountered within the Program Renewal Area are discussed below: midden and artifact and/or ecofact scatters; residential sites; non-residential sites; shellmounds; districts and landscapes; cemeteries, or indigenous burial sites; and isolated artifacts and re-deposited materials. The results of the CHRIS records search indicate there are 85 pre-contact sites in the vicinity of the Program Renewal Area, as well as an additional 16 resources that include pre-contact and historic-era components. The types of pre-contact sites are further described below.

Midden and Artifact and/or Ecofact Scatters

The majority of pre-contact sites in the Santa Clara Valley are shell middens located near coastal or estuarine habitats, and along major waterways such as the Guadalupe River and Coyote Creek. Middens are accumulations of organic material left behind by human activities, such as marine shell, food bone, charcoal from cooking fires, ash, and other food waste that darkens the soil. Middens commonly include some combination of flaked stone artifacts and debitage left over from their manufacture, such as: flakes and shatter; ground stone implements and fragments; burnt and unburnt faunal bone; ash; charcoal; and fire-affected

rocks. Middens in Santa Clara Valley and the surrounding Bay Area are typically characterized by relatively high concentrations of marine shell and shell fragments. Shell middens resulted from long-term or frequent occupation by people carrying out daily activities such as food preparation, eating, and toolmaking, as well as the gathering and processing of massive quantities of shellfish. Extended occupation by large groups of people, as well as periods of intentional construction, led to the accumulation of mounded shell middens, called shellmounds. Even among shellmounds, there were varying sizes and, perhaps, varying functions.

An alternative way of describing midden and artifact and/or ecofact scatter property types in the area is to divide them into two broad categories of resources: residential and non-residential sites (William Self Associates and Dean 2009; Ziesing 2000). These categories are general enough that they encompass material evidence from the entire pre-contact period and allow for the study of cultural change through time. Indigenous people subsisted by hunting and gathering; harvesting the fauna and flora available in the wooded hills and coastal and estuarine habitats of the greater San Francisco Bay Area. They hunted deer, trapped smaller animals and birds, caught fish and sea mammals, and ate shellfish. They also ate acorns, berries, and other plant foods that were available at different times throughout the year. In general, Native Americans in the region moved with the seasons, but also returned to favorite locations and group gathering places. As a result, the archaeological record in the Santa Clara Valley includes a variety of site types that housed different numbers of people for varying lengths of time (e.g., individual hunting groups, small tribal groups, or larger gatherings of tribes).

Shellmounds are included in the discussion below as a separate category from residential and non-residential sites because they are a site type characteristic of the greater San Francisco Bay Area, and because there is ongoing debate about whether shellmounds are residential or non-residential sites (Lightfoot 1997; Lightfoot and Luby 2002).

Residential Sites

Residential sites contain evidence of permanent or semi-permanent occupation. In addition to midden, a residential site typically contains fire pits or hearths with ash, charcoal, and/or fire-affected rocks; circular or oval depressions of house floors; and, often, human burials. Large sites with very thick middens and multiple features such as hearths, house floors, and burials have traditionally been interpreted as villages.

Villages are characterized by large concentrations of a wide variety of artifacts and features, along with human burials. These sites represent long-term and/or frequent occupations by large groups of people. The deposits result from a full range of activities relating to daily life. These sites are identified by concentrations of shell and shell fragments from a variety of shellfish species, and combinations of materials such as charcoal, ash, faunal bone, fire-affected rock, shell ornaments, bone tools, groundstone implements, flaked stone tools (e.g., spear, knife, and arrow points and the debitage from their manufacture), human remains, quartz crystals, mica, ochre, and filled pits or impressions. The upper portions of San Francisco Bay Area shell middens are typically no longer present and layers beneath the present ground surface may have been damaged or destroyed by urban development. However, in many cases the deepest layers (at least 5 feet bgs) may remain intact.

Occupation sites are another category of residential sites. These are smaller than village sites, and likely housed smaller groups of people for shorter periods of time. The primary distinctions between village sites and occupation sites are the size of the settlement, as well as length of occupation. Residential occupation sites exhibit similar concentrations of artifacts and materials gathered and/or produced by humans while conducting a range of cultural practices that were typically carried out at short-term campsites, but they become occupation sites when the sites were occupied long enough to leave behind features visible as part of the archaeological record. Features that may be found at short-term occupation sites include hearths (concentrations of fire-affected rock, charcoal, ash, and perhaps, faunal bone or flaked stone debitage); house pits or house floor impressions (hardened earth, sometimes lined with fired clay); and burials (cremations with concentrations of burned human remains, ash, charcoal; or flexed interments with human remains and associated artifacts).

Non-residential Sites

Non-residential sites, also referred to as special purpose sites, include diverse site types, but their common characteristic is they lack indications of long-term occupation. They represent activities that were carried out away from a residential base, such as temporary hunting or shellfish gathering camps, or isolated burials. These sites typically contain concentrations of limited artifact types and materials gathered or produced by indigenous peoples in pursuit of a limited range of activities or a single activity, such as deer hunting, shellfish gathering, butchering, or flaked stone tool or shell bead manufacture.

Shellmounds

Shellmounds are common sites found along the San Francisco Bay shoreline and have been interpreted not only as residential, ritual, and burial sites, but also as symbolic landscapes. Coastal and bay shoreline shellmounds would have been highly visible in pre-contact times, and their relative size and locations could have had symbolic, social, political, and historical significance.

The role of shellmounds in the subsistence-settlement system most likely changed over time, as evidenced by the variation in location, characteristics, and interrelationships of the shellmounds. The shellmounds have been proposed as residential bases, refuse accumulations, garbage dumps, or specialized ceremonial sites. Because many of the mounds contain abundant and intermixed evidence of food remains, hearths, house floors, and burials, it is difficult to devise a simple and comprehensive explanation for their function. Lightfoot and Luby (2002) argue for the ceremonial significance of the mounds, partly because the mounds they examined once rose above the landscape—some as high as three-story buildings—providing impressive visual markers that they argue likely had symbolic value. The Tamien Nation notes that shellmounds are significant religious spaces and places of ceremonial gestures to give offerings to deities and feeding ancestors (Tamien 2022).

Due to the intensive industrialization and urban development of the greater San Francisco Bay Area, most of the 425 mounds that Nelson (1909) documented in the early twentieth century have been either completely destroyed or severely compromised and most are no longer visible on the landscape. Archaeological methods have become more sophisticated, and the understanding of the construction and chronology of shellmounds, as well as the cultural history of the surrounding countryside, has grown considerably since the mass

excavations and destruction of shellmounds in the first half of the twentieth century. Today, most analysis and interpretation of shellmound function relies upon existing data recovered with outdated techniques and incomplete understanding of the complexities of chronology and structure. Recent construction projects have rediscovered intact portions of some shellmounds once thought to be completely destroyed.

Districts and Landscapes

Districts include a concentration, linkage, or continuity of pre-contact sites that derive importance from being unified spatially and/or typologically. Districts comprise both features that lack individual eligibility, are individually eligible, or a combination of both. Districts can contain multiple property types. A district must be within a definable geographic area. In addition, landscapes, such as the specific location where significant traditional events, activities, or cultural observances have taken place, may be considered culturally significant. Two archaeological districts in Santa Clara County, the Coyote Creek Archaeological District and the Circle of Circles Archaeological District, are listed in the California Register of Historical Resources. There are also documented landscapes, including the Juristac Tribal Cultural Landscape, which has been recommended eligible for listing in the California Register of Historical Resources as a Tribal Cultural Landscape.

Cemeteries and Isolated Human Remains

Cemeteries, or indigenous burial sites, including interments and cremations, are most often found in association with residential sites, but occasionally concentrations of burials were placed in a cemetery with no evidence of occupation. Isolated human remains, are occasionally found in the Santa Clara Valley with no apparent associations. All burial sites, whether a cemetery or isolated burial, is considered an important and protected resource.

Isolated Artifacts and Re-deposited Materials

Isolated artifacts have occasionally been found in the Santa Clara Valley with no apparent associations. Such finds may represent objects lost during their use, or more likely, re-deposited materials (secondary deposits) that may result from various processes in antiquity (such as erosion out of a deposit by wave action or creek flow) or historic or modern ground disturbance (such as construction work). Re-deposited cultural materials and isolated artifacts have been removed from their original context and may have limited information potential. In certain cases, isolated remains may have great potential informational value due to the rarity of such items, as in the case of re-deposited Middle Holocene artifacts.

Historic-era Property Types

Historic-era property types that could be found in the Program Renewal Area include remnants of historic-era landscape features and refuse features. Other historic-era property types include architectural features such as foundations or walls, and infrastructure features such as utilities. However, these property types are most effectively addressed through archival research and would not likely be evaluated as significant. Submerged maritime resources may also be present in the Program Renewal Area, such as the barge identified in Alviso Slough in 2010 (Pacific Legacy 2010). The results of the CHRIS records search indicate there are 58 historic-era resources in the immediate vicinity of the Program Renewal Area, including two historic districts, the Valley Water dams district and Grant Historic Landscape,

as well as a quarry, ponds, mining sites, artifact concentrations, and structures such as bridges, trestles, and culverts. A more detailed description of the types of historic-era property types is discussed below.

Landscape Features

Landscape features in the archaeological record are often ephemeral resources, such as fence lines and ditches, which may give evidence of historic-era land uses. More substantial landscape features may include elements such as stone walls and irrigation canals. While historic maps are critical for understanding landscape evolution, the research potential for landscape features varies, and often depends on what is understood about historic-era land use from the documentary record. Significant alterations to watercourses within Santa Clara Valley during the historic period could be considered to have archaeological components such as artifacts, features, and structural foundations and represents the growing Bay Area population who settled by and increasingly drew from available freshwater sources.

Refuse Features

Refuse features that result from domestic and commercial use of an area have proven to be one of the most useful sources for historic-era archaeological investigations in urban settings. Two primary types of refuse features are recognized in archaeological practice: hollow-filled refuse features and sheet refuse features. Hollow-filled refuse features include refuse pits, privies, wells, and other similar features. These property types were created for specifically functional use and during their use-life or upon abandonment they became receptacles for refuse. Discrete refuse features provide archaeologists with a glimpse of the day-to-day practices of the occupants who used them. As such, these features frequently have the ability to address important research themes. Subsurface, hollow-filled refuse features are commonly associated with late-nineteenth century or early-twentieth century dwellings that were present before later structures were built, and they are often the target of archaeological testing programs.

Sheet refuse features include broad artifact scatters, as well as more ephemeral surface scatters that are sometimes indicative of more extensive archaeological deposits located beneath the surface. Sheet refuse often accumulates on living surfaces over a period of time, or sheet refuse may also be introduced as fill to raise low ground. The long accumulation time involved in creating such property types can be problematic for archaeologists – it may be difficult to make substantive interpretive statements from a sheet refuse layer deposited over many years by numerous occupants. Some sheet refuse deposits may have information potential, but only if they can be securely dated and if the remains are abundant and varied (Van Bueren et al. 2003). Larger refuse deposits may also be important if they can be associated with a particular residential or ethnic group (Voss 2008).

Architectural Features

Architectural features that may be considered archaeological resources include subsurface structural remains such as foundations, wall footings, and floor remnants. This property type encompasses a wide variety of buildings and other structures. In many cases, architectural remains correlate with buildings and structures depicted on maps, photographs, and other documents, especially in an area as well-documented as the Program Renewal Area. When that is the case, the ability of those remains to contribute information to important research

themes may be limited, especially for later nineteenth and twentieth century features. Many research questions that could be addressed by architectural features are often better suited to other research media, such as analysis of primary documents, rather than archaeological study. However, archaeological investigation can sometimes add previously undocumented details to the historical record.

Infrastructure Features

Infrastructure includes those features related to development and maintenance of the region, such as roads, cisterns, sewer lines, drainpipes, power lines, water lines, and hydrants. Infrastructure features often correlate to utility maps and the locations of architectural features such as buildings. Numerous infrastructure features, including rail tracks and water lines, are identified on historic Sanborn maps and are likely still present throughout the Program Renewal Area. Documentation of infrastructure features is often available in the historical record; however, it is possible that features may be considered significant if they add previously undocumented details to the historical record.

Maritime and Land Reclamation Features

Potential maritime features within the Program Renewal Area include undocumented shoreline maritime infrastructure, such as piers or wharves, boats, barges, or features associated with land reclamation. Features associated with the process of land reclamation could also be considered maritime features and may be encountered during ground disturbing activities. Such features could include landfill retaining structures, bulkhead, or piles. The significance of an individual features would depend on the type of resource represented, as well as its integrity.

Districts

Districts include a concentration, linkage, or continuity of historic-era resources that derive importance from being unified spatially and/or typologically. Districts may be comprised of both features that lack individual eligibility and/or are individually eligible. Districts can contain multiple property types including buildings, structures, objects, sites, and landscape features. A district must be within a definable geographic area based upon a shared relationship among the features that comprise the district.

Paleontological Resources

The Santa Clara Valley contains a diverse record of geologic and biologic history spanning more than 150 million years and dates from the Jurassic Period to the present. The processes of multiple tectonic influences (faulting, uplift, sedimentary deposition, sea level fluctuations) have combined to create a significant record of both marine and terrestrial fossils in the Program Renewal Area.

Much of the paleontological interest in the region is caused by discoveries of fossilized Pleistocene vertebrates from Quaternary deposits in the South San Francisco Bay Area. Descriptions of these fossil vertebrates have provided scientists with one of the most complete records of Pleistocene fauna in California (Santa Clara County Parks and Recreation Department 2006).

Sediments of Holocene age that form thin surficial cover are considered to be of little paleontological interest and are, therefore, considered to possess low sensitivity for fossil specimens (Santa Clara County Parks and Recreation Department 2006).

Specific to the Program Renewal Area, in 2005, a fossil of a young Columbian mammoth (*Mammuthus columbi*) was found on a floodplain/overflow area east of the Guadalupe River downstream of Trimble Road in San Jose, just north of Mineta San Jose International Airport. The fossil dates from the late Pleistocene epoch and included portions of skull, tusks, molar teeth, femur, toes, ribs, and other bone fragments (University of California Museum of Paleontology 2005).

3.5.4 Impact Analysis

Methodology

CEQA requires assessment of a project's potential effects on historical resources, as defined in Section 15064.5 of the CEQA Guidelines (see below). In general, historical resources are those listed or eligible for inclusion on the California Register or in a local register or identified based on a survey that meets the requirements of Pub. Res. Code Sections 5020.1 (k) and 5024.1(g). The identification of historical resources involves several steps, including identifying cultural resources within a project's boundaries; evaluating the resources to determine if they qualify as historical resources; and determining whether the project has a substantial direct or indirect effect on historical resources. Resources found not to be "historical resources" or otherwise "historically significant" need no further management, unless they are "unique archaeological resources". In general, effects on significant CEQA resources can be reduced to less-than-significant levels by applying the proper treatment or management measures, such as avoidance, and if avoidance is not feasible, further documentation, or data recovery.

As discussed above in Section 3.5.3, "Environmental Setting," the potential for the occurrence of pre-contact and historic-era cultural resources generally is high along existing waterways. Furthermore, because of alluvial flooding along waterways, the potential for buried cultural deposits is high. Several components of the Program Renewal would require ground disturbing activities that could disturb previously documented or unknown and potentially important pre-contact and historic-era cultural resources. The Program Renewal would not include any activities that could affect buildings, so an evaluation of buildings was not undertaken as part of this analysis.

An analysis of the types of activities to be undertaken and their potential impacts on cultural resources is provided below. These or similar activities have been occurring in Valley Water-maintained canals and channels for many years. Both the SMP-1 and SMP-2 EIRs provided a programmatic approach to reducing impacts to cultural resources to a less-than-significant level. Treatment measures included in Program Renewal BMPs include the same pre-construction surveys, avoidance, monitoring, and protocols for inadvertent discoveries, including evaluation of finds and potentially data recovery. The impact analysis baseline is based on the existing conditions at the time of the May 2022 Notice of Preparation and evaluates impacts from the maintenance activities implemented for the existing Program (SMP-2) and the new activities proposed for the Program Renewal.

Potential Impacts of Program Renewal Activities

Routine activities undertaken as part of the Program Renewal include sediment removal, vegetation management, bank stabilization, management of animal conflicts, minor maintenance (e.g., fence installation and repair, trash and debris removal), and large woody debris management. Minor maintenance activities added to the Program Renewal includes trash boom maintenance, work at maintenance yards, trash clean-up activities near bridges, and repairs to upper and lower maintenance roads in addition to grading maintenance yards, and maintenance at off-channel detention basins. These routine activities include varying degrees of ground-disturbing activities that may impact cultural resources. Ground-disturbing and construction activities could impact previously documented or unknown potentially important cultural resources.

Certain activities proposed by Valley Water do not have the potential to disturb native soils and therefore do not have the potential to impact cultural resources. Program activities have therefore been divided into two categories: (1) activities that will disturb native soils by excavation, construction, or sediment disposal; and (2) activities that will not disturb native soils.

Activities that will disturb native soils include maintenance activities required for sediment removal, vegetation management, bank stabilization, and minor maintenance that requires the disturbance of native soils by excavation and/or construction. This includes culvert replacement, stream channel access or clearing, sediment removal, hazardous tree removal, and the reuse of sediments for habitat restoration. Where cultural resources are present in native soils, disturbance of these native soils has the potential to impact such resources.

Activities that will not disturb native soils consists of activities such as those that are accomplished from the top of bank, including minor vegetation and debris removal from modified and natural channels; those conducted in imported fill material; those involving the use of handheld equipment; or those involving other non-ground-disturbing activities (e.g., management of animal conflicts). These activities do not have the potential to disturb native soils and therefore would not impact cultural resources. These activities do not require any additional assessment.

Criteria for Determining Significance

For the purposes of this analysis and consistent with CEQA Guidelines Appendix G, the Program Renewal would result in a significant impact on cultural and paleontological resources if it would:

A. Cause a substantial adverse change in the significance of a historical or archaeological resource as defined in Section 15064.5; or

B. Disturb any human remains, including those interred outside of formal cemeteries; or

C. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Environmental Impacts

Impact CR-1: Adverse Effect on Known and Previously Undiscovered Archaeological or Historical Resources (Less than Significant)

Ground-disturbing maintenance activities conducted under the Program Renewal would have the potential to disturb and have substantial adverse effects on known or previously undiscovered cultural resources within the Program Renewal Area, including CEQA-defined "historical resources" and "unique archaeological resources."

Sediment Removal and Bank Stabilization

Sediment removal and bank stabilization activities would involve ground disturbance of creek channels and banks in the Program Renewal Area, through implementation of the activities themselves and the potential construction of temporary access routes. Ground disturbances associated with these activities could adversely impact known or previously undiscovered archaeological or historical resources, including pre-contact indigenous resources such as midden; artifact deposits; residential sites; use areas; shellmounds; burials; and isolated artifacts as well as historic-era resources such as landscape features, refuse features, and other architectural remnants including maritime features. These types of resources would most likely be identified along natural stream channel alignments, although artificially constructed channels could also extend through areas of sensitivity. Sediment removal or bank stabilization activities could result in alteration of elements of these resources that made them eligible for the California Register or could result in a substantial change in the significance of a historical resource. Most of these activities would be conducted in modified or engineered channels; therefore, any undiscovered resources may have already been altered or destroyed during channel construction or historic maintenance activities. Nevertheless, stream channels are areas that are considered highly sensitive for the presence of cultural resources, and although most work would not extend below as-built conditions, work conducted in native soils below the engineered channel could have a substantial adverse effect on previously undiscovered CEQA-defined historical resources or unique archaeological resources which would be a significant impact.

Other Maintenance Activities

All other categories of maintenance (culvert replacement, stream channel access or clearing, hazardous tree removal, and the reuse of sediments for habitat restoration) include ground-disturbing activities that could impact known or previously undiscovered archaeological or historical resources. Other practices that may impact cultural resources include vegetation management activities such as discing, and minor maintenance activities including minor sediment removal or grading. The effects of these other maintenance activities on known or unknown archaeological or historical resources would be similar to those described for sediment removal and bank stabilization activities.

Applicable Best Management Practices

The BMPs summarized below would be implemented as part of the Program Renewal to minimize the potential for disturbances to archaeological, paleontological, or historical

resources. Full descriptions of each BMP are provided in Chapter 2, *Project Description,* **Table 2-10**.

- **BMP GEN-47: Minimize Impacts to Inadvertently Discovered Cultural Resources** will ensure that work occurring in areas where archaeological or historical resources are identified will be restricted or stopped until an archaeologist determines if the find meets the California or National Register criteria of significance, or if the find is a unique archaeological or tribal cultural resource. If the resource is assessed as significant and cannot be avoided, an Action Plan will be developed including preparation of a data recovery program, as needed.
- **BMP GEN-50: Review of Projects with Native Soil** will ensure that an analysis is conducted of project sites that would involve disturbance/excavation of native soil to determine the potential for affecting archaeological or historical resources. If resources would be impacted and could not be avoided, appropriate management actions (e.g., monitoring during construction, presence/absence testing for subsurface resources, data recovery, etc.) would be developed.

Conclusion

By implementing these BMPs, known cultural resources would be identified, evaluated, and avoided if significant, and procedures would be followed to minimize impacts on previously unknown archaeological or historical resources. Because these BMPs would assure that the Program Renewal would not cause substantial adverse changes in the significance of CEQA-defined historical resources or unique archaeological resources, this impact would be **less than significant,** and no mitigation would be required.

Mitigation Measures: No mitigation is required.

Impact CR-2: Disturbance of Human Remains (Less than Significant)

Ground-disturbing maintenance activities conducted under the Program would have the potential to unearth human remains, including Native American remains.

Sediment Removal/Bank Stabilization

As described above, sediment removal and bank stabilization activities would involve ground-disturbing activities. These activities could impact human remains, including Native American human remains, which would be a significant impact in the absence BMP GEN-49. Native Americans consider the remains of their ancestors and the offerings buried with them to be sacred and wish to prevent the disturbance of interments.

Other Maintenance Activities

Other proposed maintenance activities (vegetation management, minor maintenance, and management of animal conflicts) would, in some cases, also involve ground-disturbing activities that could potentially impact human remains, including Native American human remains.

Applicable Best Management Practices

The BMPs summarized below would be implemented as part of the Program Renewal to appropriately respond to the discovery of human remains, consistent with requirements of Pub. Res. Code Section 5097.98 and Health and Safety Code Section 7050.5. A full description of this BMP is provided in Chapter 2, *Project Description,* Table 2-10.

- **BMP GEN-49: Discovery of Human Remains** will ensure that if human remains are identified, all work will be restricted or stopped until proper protocols are met, including meeting the requirements of Pub. Res. Code Section 5097.98 and Health and Safety Code Section 7050.5, which requires work to halt in the vicinity of the find, the County coroner to inspect the find and determine the cause of death. If the find is determined to be Native American in origin, the coroner is required to notify the Native American Heritage Commission, who assigns a Most Likely Descendant. The Most Likely Descendant makes recommendations for the appropriate treatment of the human remains.

Conclusion

By implementing BMP GEN-49, the County coroner would be contacted if human remains are identified and, if determined to be Native American, the Native American Heritage Commission would assign a Most Likely Descendant who would make additional recommendations. The Most Likely Descendant makes recommendations for the appropriate treatment of the human remains. This impact would be **less than significant**, and no mitigation would be required.

Mitigation Measures: No mitigation is required.

Impact CR-3: Impacts to Sensitive Paleontological Resources (Less than Significant)

The Program Renewal could affect known or unknown paleontological resources during ground-disturbing or excavation activities.

Sediment Removal/Bank Stabilization

Because the majority of sediment removal and bank stabilization activities would be conducted in channels that have been modified from their natural condition, they would not be expected to contain geologic material with a high likelihood of containing paleontological resources. As such, the discovery of paleontological resources during Program Renewal activities is extremely unlikely. However, activities that would result in excavation of native soils, such as bank stabilization, could uncover previously undiscovered paleontological resources.

Other Maintenance Activities

Other proposed maintenance activities (vegetation management, minor maintenance, and management of animal conflicts) could involve ground-disturbing activities, including potential excavation of native soils. The potential effects of these activities on known or

undiscovered paleontological resources would be similar to that described for sediment removal and bank stabilization activities.

Applicable Best Management Practices

The BMP summarized below would be implemented as part of the Program Renewal to minimize the potential for impacts to sensitive paleontological resources. A full description of this BMP is provided in Chapter 2, *Project Description,* Table 2-10.

- **BMP GEN-48: Discovery of Paleontological Resources** will ensure that work in areas where paleontological resources are identified will be restricted or stopped until a paleontologist performs minor hand-excavation to describe the paleontological resources present and provides treatment recommendations for the find.

Conclusion

BMP GEN-48 would include stop-work and treatment measures in the event of a discovery of paleontological resources. As a result, this impact would be less than significant, and no mitigation would be required.

Mitigation Measures: No mitigation is required.

3.6 Energy

3.6.1 Introduction

This section evaluates the impacts on energy resources of the Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal). This analysis evaluates the Program Renewals energy demands; provides input on operation-related energy use; and considers the Program Renewal's size, location, equipment use, and features that could be incorporated to conserve energy resources.

The baseline that was used for the Energy analysis is the existing energy use generated by the current Stream Maintenance Program (SMP-2) activities. To the extent that new areas have been added for the Program Renewal, as well as the addition of new types of treatments requiring new pieces of equipment, an incremental increase in energy use would result in potential increases compared to the current baseline condition's existing energy resources.

3.6.2 Regulatory Setting

The following subsections discuss federal and state laws and regulations that pertain to energy for the Program Renewal. Applicable regional and local plans, policies, regulations, and ordinances related to energy are described in **Appendix C**, *General Plan Policies and Ordinances*. In summary, Appendix C discusses several plans throughout Santa Clara County and local jurisdictions that contain policies aimed at energy conservation and the increase in use of renewable energy sources as well as transitioning to electrical vehicles and equipment. Additionally, the Valley Water Climate Change Action Plan, which is described in Section 3.3, "Air Quality," is relevant to energy because it describes policies for reducing the use of fossil fuels by using electric and alternative fuels for vehicles and off-road equipment, as well as discusses the use of renewable energy sources for electricity generation.

Federal Plans, Policies, Regulations, and Laws

See Section 3.3, "Air Quality," for a full description of the Federal Vehicle Emission Standards, which are relevant to the energy analysis.

Energy Policy and Conservation Act

The Energy Policy and Conservation Act of 1975 was established in response to the oil crisis of 1973, which increased oil prices due to a shortage of reserves. The Act required that all vehicles sold in the United States meet certain fuel economy goals,[1] known as the Corporate Average Fuel Economy (CAFE) standards. The National Highway Traffic Safety Administration (NHTSA) of the U.S. Department of Transportation (DOT) administers the CAFE program, and the U.S. Environmental Protection Agency (USEPA) provides the fuel economy data.

[1] Fuel economy standards are expressed in miles per gallon.

Energy Policy Act of 2005

The Energy Policy Act of 2005 seeks to reduce reliance on non-renewable energy resources and provide incentives to reduce current demand on these resources. For example, under the Energy Policy Act, consumers and businesses can attain federal tax credits for purchasing fuel-efficient appliances and products. Businesses are eligible for tax credits for buying hybrid vehicles, building energy-efficient buildings, and improving the energy efficiency of commercial buildings. Additionally, tax credits are given for the installation of qualified fuel cells, stationary microturbine power plants, and solar power equipment. The Energy Policy Act of 2005 also established the first renewable fuel volume mandate in the United States. The original Renewable Fuel Standard program required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012.

Under the Energy Independence and Security Act of 2007, the Renewable Fuel Standard program was expanded to include diesel and to increase the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.

State Plans, Policies, Regulations, and Laws

See Section 3.3, "Air Quality," for a discussion on transportation-related standards and regulations that also relate to energy. These standards and regulations include the Advanced Clean Truck (ACT) Regulation, Advanced Clean Cars Program, Advanced Clean Fleets (ACF) Regulation, the In-Use Off-road Diesel-Fueled Fleets Regulation, Small Off-road Engine Regulation, and the Portable Equipment Registration Program.

Section 3.7, "Greenhouse Gas Emissions," describes the Renewable Portfolio Standard (RPS) and other related bills for renewable energy generation requirements in California, as well as the Low Carbon Fuel Standard, that are relevant to energy. Section 3.7 also describes Assembly Bill 32 and Senate Bill (SB) 32, the California Global Warming Solutions Act, the Climate Change Scoping Plan, and the Renewable Energy Portfolio, all of which are also applicable to energy.

Warren-Alquist Act

The 1975 Warren-Alquist Act established the California Energy Resources Conservation and Development Commission, now known as the California Energy Commission (CEC). The Act established a state policy to reduce wasteful, uneconomical, and unnecessary uses of energy by employing a range of measures.

Integrated Energy Policy

In 2002, the Legislature passed SB 1389, which required the CEC to develop an integrated energy plan biannually for electricity, natural gas, and transportation fuels, for the California Energy Report. The plan calls for the state to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for zero emission vehicles (ZEVs) and their infrastructure needs, and encouragement of urban designs that reduce vehicle miles traveled and accommodate pedestrian and bicycle access.

The latest update is the 2022 Update to the Integrated Energy Policy Report (CEC 2023a). The 2022 Integrated Energy Policy Report (IEPR) Update identifies actions the state and others can take to ensure a clean, affordable, and reliable energy system. The 2022 IEPR Update covers a broad range of topics, including energy reliability and western electricity integration, decarbonizing the electricity sector, and transportation electrification.

Regional Programs

Section 3.7, "Greenhouse Gas Emissions," describes Valley Water's Climate Action Plan (CCAP) and other regional programs that are relevant to energy.

3.6.3 Environmental Setting

Energy resources involve electricity that is transmitted to end users to power electrical equipment and is measured in terms of kilowatts or megawatts. Natural gas is a common form of energy used for electricity generation, heating and industrial processes and is measured in terms of energy content in British thermal units (Btu) or cubic feet of gas. Gasoline and diesel are used in passenger vehicles, heavy-duty vehicles, and off-road equipment to operate the vehicles and equipment and is typically reported in terms of gallons of fuel consumed.

Regional Setting

With a relatively mild Mediterranean climate and strict energy efficiency and conservation requirements, California has lower energy consumption rates on a per person basis than most other parts of the country.

California relies on a regional power system composed of a diverse mix of natural gas, and renewable, hydroelectric, and nuclear generation resources. Approximately 70 percent of the electrical power needed to meet California's demand is produced in the state; the balance, approximately 30 percent, is imported from the Pacific Northwest and the Southwest. In 2021, California's in-state electricity use was derived from natural gas (50 percent), coal (0.2 percent), large hydroelectric resources (6 percent), nuclear sources (9 percent), and renewable resources that include geothermal, biomass, small hydroelectric resources, wind, and solar (35 percent) (CEC 2022a).

Electricity and natural gas in California are generally consumed by stationary users such as residential, commercial, and industrial facilities, whereas petroleum-based fuel is generally consumed by transportation-related uses (U.S. Energy Information Administration [US EIA] 2022a).

Program Renewal activities would require the use of fuel for vehicles and equipment primarily in the form of gasoline and diesel. Therefore, these energy resources are discussed below in the context of the regional and local setting for the Program Renewal.

Transportation Fuel Generation, Demand, and Use

Fuel is used primarily for powering off-road equipment (construction and operational) and vehicles (commercial trucks and other vehicles). The typical fuel types are diesel and gasoline.

The Northern California region produced an annual average of 6,138,527 thousand gallons of gasoline and 2,363,161 thousand gallons of diesel over the 5-year period of 2018-2022 (CEC 2023b).

California is the seventh largest producer of crude oil and has the third largest refining capacity in the nation (US EIA 2022a). The energy consumed by the transportation sector accounts for roughly 83 percent of California's petroleum products demand (US EIA 2022b). According to the CEC, the state relies on petroleum-based fuels for 98 percent of its transportation needs (US EIA 2022a, 2022b). In 2022, taxable gasoline sales (including aviation gasoline) in California accounted for approximately 12.5 billion gallons of gasoline (California State Board of Equalization [CBE] 2023a), and taxable diesel fuel sales accounted for approximately 2.8 billion gallons of diesel fuel (CBE 2023b).

The CEC forecasts show that the demand for gasoline in California will range from 12.1 billion to 12.6 billion gallons in 2030, with most of the demand generated by light-duty vehicles[2]. While the models show an increase in light-duty vehicles along with population and income growth over the forecast horizon, total gasoline consumption is expected to decline, primarily due to increasing fuel economy (stemming from federal and state regulations) and gasoline displacement from the increasing market penetration of ZEVs. For diesel, demand is forecasted to increase modestly by 2030, following the growth of California's economy, but it will be tempered by an increase in fleet fuel economy and market penetration of alternative fuels, most prominently by natural gas in the medium- and heavy-duty vehicle sectors (CEC 2018).

According to the CEC, in 2021, sales of gasoline and diesel fuel in Santa Clara County were 599 million gallons and 50 million gallons, respectively (CEC 2022b). Note that the CEC only tracks fuel sales at the retail level, which allows for data to be collected on a county-by-county basis, whereas the CBE tracks all fuel sales, retail and non-retail, at the statewide level. Thus, the impact calculations presented in the impact analysis rely on separate data sets for comparison to Santa Clara County and the statewide transportation fuel consumption figures.

Electricity Generation, Demand, and Use

Electricity is used primarily for lighting, equipment, and other uses associated with building, structures, and vehicle operations. Electricity sources range from renewable (hydroelectric, solar, wind, geothermal, biomass) to nonrenewable (natural gas, petroleum, nuclear, coal).

In 2021, total system electric generation for California was 277,764 gigawatt-hours (GWh), up two percent from 2020's total generation of 272,576 GWh (CEC 2022a). Electricity from non–carbon dioxide (CO_2)–emitting electric generation categories (i.e., nuclear, large hydroelectric, and renewable generation) accounted for 49 percent of total in-state generation.

Total system electric generation in California is predicted to increase in coming years. Factors contributing to the projected increase include greater numbers of light duty electric vehicles, increased electricity consumption from manufacturing, and decreases in savings from energy efficiency programs as population increases. With regard to the total consumption of

[2] Light-duty vehicles include passenger and fleet cars and trucks that weigh less than 8,500 pounds.

electricity across all sectors, California consumed 247,250 GWh of electricity in 2021 (US EIA 2022c).

Pacific Gas and Electric Company (PG&E) provides electrical services to most residential, commercial, industrial, and agricultural consumers in much of Northern California, including the Bay Area. In 2021, PG&E generated and/or procured a total of 33,149 GWh of electricity (PG&E 2022a). PG&E has established contracts and commitments to ensure there is adequate electricity generation and natural gas capacity to meet its current and future energy loads (PG&E 2022b).

California law requires load-serving entities (e.g., companies or governments that are obligated by law or via contract to provide electrical power to users) to gradually increase the amount of renewable energy they deliver to their customers to at least 33 percent of their total annual retail sales by 2020, 44 percent by 2024, 52 percent by 2027, 60 percent by 2030, and 100 percent by 2045. This program, the RPS (described under "Regulatory Setting" in Section 3.7, "Greenhouse Gas Emissions"), became effective in December 2011 and has since been enhanced with the passage of SB 350 and SB 100. Renewable generation resources, for purposes of the RPS program, include bioenergy, small hydroelectric facilities (30 megawatts [MW] or less), wind, solar, and geothermal energy. In 2023, PG&E obtained approximately 30 percent of its electricity from renewable sources and delivered 100% greenhouse gas-free electricity to residential and business customers (PG&E 2022c).

Natural Gas Use

Natural gas is used primarily for heating and water heating and is typically associated with building operations.

One third of energy consumed in California is natural gas, which is largely imported from other regions (CEC 2019). Californians consumed 21,728 million therms of natural gas in 2021, which is equal to approximately 2,172,800,000 million Btu (MMBtu) (US EIA 2022d). Nearly 31 percent of the natural gas burned in California is used for electricity generation, and most of the remainder is consumed in the residential (21 percent), industrial (34 percent), and commercial (11 percent) sectors.

PG&E provides natural gas service to industrial, large commercial, natural gas-fired electric generation facilities, and residential users that are connected to the gas system throughout much of northern California, including the Bay Area. In 2021, the total consumption of natural gas in Santa Clara County was 417 million therms, or 41,728,162 MMBtu (CEC 2022b), which was approximately 2 percent of California's total gas consumption.

Valley Water

Electricity Generation

Valley Water participates in the Power and Water Resources Pooling Authority (PWRPA), which consists of publicly owned electric utilities that coordinate pooling of energy resources and supplement wholesale power purchasing. PWRPA coordinates construction and maintenance of the facilities and negotiates agreements. Ninety-five percent of Valley Water's purchased electricity is sourced from PWRPA, which enables Valley Water to source carbon-free electricity from utility-scale solar and hydroelectric projects (Valley Water 2021). Every facility Valley Water operates (office, WTP, pump plant, vehicle charger, etc.) derives power

from PWRPA, with just a small portion of purchased electricity coming from PG&E and/or Community Choice Aggregations as needed. For this reason, Valley Water's electricity-related greenhouse gas (GHG) emissions are almost negligible, since the electricity it buys from PWRPA is emission-free hydropower. Since some of the sources of this carbon-free electricity are based on hydroelectric projects, it is subject to variability, especially during drought conditions. The 2022 Power Content Label for PWRPA is shown in **Table 3.6-1**.

Table 3.6-1. PWRPA 2022 Power Content Label

Energy Resources	Standard Water Portfolio[4]	Zero Carbon Water Portfolio[4]	2022 California Power Mix (for comparison)
Eligible Renewable[1]	25.8%	36.1%	35.8%
Biomass & Biowaste	0.0%	0.0%	2.1%
Geothermal	0.0%	0.0%	4.7%
Eligible Hydroelectric	1.1%	0.3%	1.1%
Solar	24.7%	35.8%	17.0%
Wind	0.0%	0.0%	10.8%
Coal	0%	0%	2.1%
Large Hydroelectric	3.7%	63.9%	9.2%
Natural Gas	5.5%	0%	36.4%
Nuclear	0%	0%	9.2%
Other	0%	0%	0.1%
Unspecified sources of power[2]	58.7%	0%	7.1%
Total[3]	100%	100%	100%

[1] The eligible renewable percentage above does not reflect RPS compliance, which is determined using a different methodology.

[2] Unspecified power is electricity that has been purchased through open market transactions and is not traceable to a specific generation source.

[3] Numbers may not add to 100% due to rounding.

[4.] As part of the PWRPA 2022 Power Mix, Standard Water Portfolio is the standard mix for clients while the Zero-Carbon Water Portfolio is for clients selecting to use a portfolio that is primarily from hydroelectric and renewables that do not contain carbons, such as from fossil fuel.

Source: PWRPA 2023

Existing SMP-2 Energy Use

Following the methodology described in Section 3.7.4 of using the existing SMP-2 estimate for equipment type and annual activity hours, the estimated annual gasoline usage is 20,611 gallons and annual diesel usage is 777,255 gallons. Further details regarding this emission estimate can be found in **Appendix D**, *Air Quality and GHG Emissions Calculations.*

3.6.4 Impact Analysis

Methodology

The baseline that was used for the energy analysis is the existing energy use generated by the current SMP-2 activities. To the extent that new areas have been added for the Program Renewal, as well as the addition of new types of treatments requiring new pieces of equipment, an incremental increase in energy use would result compared to the existing baseline condition.

CEQA Guidelines Appendix F, *Energy Conservation,* identifies six categories of energy-related environmental impacts, listed below, in order to determine whether a project would result in the wasteful, inefficient, or unnecessary consumption of fuel or energy, and conversely whether the project would fail to incorporate renewable energy or energy efficiency measures into building design, equipment use, transportation or other project features. The six categories of potential energy-related environmental impacts are as follows:

1. The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.
2. The effects of the project on local and regional energy supplies and on requirements for additional capacity.
3. The effects of the project on peak and base period demands for electricity and other forms of energy.
4. The degree to which the project complies with existing energy standards.
5. The effects of the project on energy resources.
6. The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

The analysis included below for Impact ENE-1 assesses the fuel and electricity consumption of the Program Renewal during operation. The analysis included below for Impact ENE-2 evaluates the Program Renewal for consistency with applicable plans, listed earlier in this section, related to renewable energy and energy efficiency.

The analysis estimates the gasoline, diesel, and electricity consumption associated with the operation of the Program Renewal. Appendix D shows the energy calculations based on the methods and assumptions described below.

All gasoline use is assumed to originate from worker vehicles used in commuting to the Program Renewal work sites. In addition, all worker vehicles commuting to the Program Renewal work sites were conservatively assumed to use gasoline even though other options such as diesel, hybrid, electric and other alternative fuels are possible. Based on the number of worker vehicles trips and total vehicle miles traveled (VMT) specified in **Appendix H**, *Vehicle Miles Traveled (VMT) Calculations*, total worker vehicle miles traveled are estimated. The VMT is multiplied by the fuel efficiency of the vehicles based on EMFAC 2021, the

California Air Resources Board's (CARB's) Emission Factors model (CARB 2021[3]) fuel consumption for light-duty autos and light-duty trucks to yield the amount of gasoline used.

Operational diesel use was assumed to originate from the use of heavy-duty trucks and offroad vehicles. Similar to the estimate for gasoline use, the calculation for estimating diesel use is based on the total vehicle miles traveled by heavy, heavy-duty trucks, all of which are assumed to be diesel. The truck vehicle miles traveled is multiplied by the fuel efficiency of the vehicles based on EMFAC 2021 fuel consumption for heavy, heavy-duty trucks. For offroad equipment, the brake specific fuel consumption factor (or the amount of fuel consumed per horsepower) was based on values used by CARB in its OFFROAD model (CARB 2025). These brake specific fuel consumption factors are multiplied by the horsepower, load factor, and hours of activity to determine the amount of diesel fuel used.

Criteria for Determining Significance

Based on Appendix G of the CEQA Guidelines, it was determined that the Program Renewal would result in a significant impact related to energy if it would:

A. Result in a significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy, or wasteful use of energy resources, during operation of the Program Renewal; or
B. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Environmental Impacts

Impact ENE-1: Result in a Significant Environmental Impact Due to Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources (Less than Significant)

All aspects of fossil fuel consumption associated with the Program Renewal were considered in this analysis, including fossil fuel consumption from traffic generated during maintenance activities, worker commutes and material hauling. The following analysis presents the estimated fuel and electricity use during maintenance work.

The Program Renewal would result in an intermittent increase of energy consumption during maintenance activities associated with worker commutes, operation of maintenance equipment, truck trips, and material hauling. Program Renewal maintenance activities are estimated to use 14,614 gallons of gasoline annually and 15,098 gallons of diesel annually from the operation of on-road vehicles (i.e., worker commutes and vehicle hauling), as shown in **Table 3.6-2**. Off-road equipment is estimated to use 6,144 gallons of gasoline annually and 983,182 gallons of diesel fuel annually (Table 3.6-2). The total estimated gasoline use would be 20,758 gallons annually and the total estimate diesel fuel use would be 998,280 gallons annually during maintenance work.

In addition, there may be small amounts of propane and electricity used during the Program Renewal period to power alternative and ZEV equipment; however, there is no reliable

[3] EMFAC is a model developed and used by CARB to assess emissions from on-road vehicles and is approved by US EPA. EMFAC 2021 indicates the version of the software.

information available at this time to estimate energy consumption associated with that equipment. Although some equipment and vehicles would likely use hybrid or alternative fuel technology, this analysis conservatively assumes maximum consumption of diesel and gasoline.

Table 3.6-2. Fuel and Electricity Consumption

Energy Type	Off-Road	On-Road	Total
Gasoline (gallons)	6,144	14,614	20,758
Diesel Fuel (gallons)	983,182	15,098	998,280
Propane	*		*
Electricity (megawatt-hours)	*	*	*

* Estimates of potential propane and electricity use are not available at this time as these do not have readily available estimates for their consumption and have not been extensively used.

Source: Appendix D, Air Quality and GHG Emissions Calculations

Energy use during the Program Renewal would result in increased demand on local and regional supplies of fossil fuel, such as diesel and gasoline. Given that California is the seventh largest producer of crude oil and has the third largest refining capacity in the nation, the amount of fuel consumed during Program Renewal maintenance activities would not have a substantial impact on the availability of these fuels in the state (US EIA 2022a). Any impact on local fuel supplies would be intermittent and would not require an increase in fuel production capacity. Similarly, due to the relatively small demand on gasoline and diesel fuel during the Program Renewal maintenance activities (less than 0.01 percent of California's total production of gasoline and diesel), there would not a be a temporary disruption to local fuel supplies or a need for additional fuel facilities to be constructed. Therefore, impacts on the demand of gasoline and diesel fuel would be minimal.

The electricity that would be consumed during the Program Renewal maintenance activities is unknown at this time due to the lack of historical use of electrical equipment. Program Renewal equipment that is most likely to be electric includes more traditional landscape equipment used for vegetation management such as mowers, chains saws, and leaf blowers which would be charged at Valley Water buildings, while larger pieces of equipment typically used in bank stabilization and sediment removal work may not be feasible to be electric. Valley Water has several of its own electricity-generating projects under PRWPA; these would be unlikely to experience energy supply shortfalls caused by using electrical equipment during implementation of the Program Renewal. Therefore, the peak capacity effect on the transmission grid during the maintenance season would not be substantial. Valley Water has some discretion in its decisions to charge equipment unlike concerns with building ventilation and heating, ventilation, and air conditioning (HVAC) systems or manufacturing operations.

The energy needs for the Program Renewal would be intermittent and occur throughout the primary work season and less frequently during the rest of the year and would not require additional capacity or substantially increase peak or base period demands for electricity and other forms of energy. Thus, energy would not be consumed in a wasteful, inefficient, or unnecessary manner when compared to other activities in the region. Program Renewal

vehicles and equipment would incorporate energy efficiency and renewable features as available.

Applicable Best Management Practices

The BMPs summarized below would be implemented as part of Program Renewal to reduce energy use during maintenance activities, although to the exact extent cannot be quantified. Full descriptions of each BMP are provided in Chapter 2, *Project Description.*

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of the work area, staging areas, and access routes are kept to the minimum area necessary to complete maintenance work to minimize the amount of GHG emissions.

- **BMP GEN-37: Vehicle and Equipment Maintenance** will ensure that vehicles and equipment are properly maintained so that GHG emissions are reduced.

- **BMP GEN-42: Pump/Generator Operations and Maintenance** will ensure that pumps and generators will be sufficiently maintained and operated so that impacts to water quality and aquatic species emissions are minimized. Generators will be stored and operated with secondary containment. Implementation of these measures will reduce the amount of exposure of exhaust emissions from the operation and maintenance of pumps and generators during channel dewatering.

Conclusion

For the reasons described above, the Program Renewal would not result in the consumption of energy in a wasteful, inefficient, or unnecessary manner, BMPs and Mitigation Measure GHG-1 would further reduce energy consumption, and impacts would be **less than significant**.

Mitigation Measures: No mitigation is required.

Impact ENE-2: Conflict With or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency (No Impact)

Energy would be consumed during Program Renewal activities (approximately 20,758 gallons of gasoline and 998,280 gallons of diesel fuel annually) (see Table 3.6-2); however, this amount of energy would not impede or conflict with applicable renewable energy or efficiency plans.

California has developed goals, regulations, and policies related to renewable energy, including the renewable portfolio standard, which requires California to increase the amount of power supplied by renewable electricity sources. In addition to the state policies, general plans, sustainability plans, and climate action plans covering the Program Renewal Area include policies related to renewable energy and energy efficiency. Applicable plans include policies to head toward 100 percent renewable energy by 2045 in line with the Renewable Portfolio Standard, Integrated Energy Policy, Climate Change Scoping Plan, and Valley Water's CCAP; a reduction in the use of fossil fuels and increased use of zero emission vehicles and equipment in line with the Scoping Plan and Valley Water's CCAP; and policies to encourage energy efficiency and conservation in the Climate Change Scoping Plan and Valley Water's CCAP. The Program Renewal would use energy-efficient equipment in line with CARB

fleet and equipment requirements, including the modifications to existing regulations that require the use of renewable diesel fuel, which are on the path to renewable energy and zero emission vehicles and equipment.

Further, Valley Water's continued participation in PWRPA would enable ongoing incorporation of renewable energy into the electricity supply. As described above, the Program Renewal would not generate energy demand from the electrical grid to warrant the construction or operation of additional energy infrastructure. The Program Renewal primarily involves the use of fossil fuels and alternative fueled equipment and vehicles and would not have a significant draw on electrical resources. Additionally, the use of gasoline and diesel fuel during Program Renewal activities would be intermittent throughout the year.

Based on the above analysis, Program Renewal activities would not conflict with or obstruct a renewable energy or energy efficiency plan.

Applicable Best Management Practices

The BMPs summarized below would be implemented as part of the Program Renewal to reduce energy use during maintenance activities, although to the exact extent cannot be quantified. Full descriptions of each BMP are provided in Chapter 2, *Project Description.*

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of the work area, staging areas, and access routes are kept to the minimum area necessary to complete maintenance work to minimize the amount of GHG emissions.
- **BMP GEN-37: Vehicle and Equipment Maintenance** will ensure that vehicles and equipment are properly maintained so that GHG emissions are reduced.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** will ensure that pumps and generators will be sufficiently maintained and operated so that impacts to water quality and aquatic species emissions are minimized. Generators will be stored and operated with secondary containment. Implementation of these measures will reduce the amount of exposure of exhaust emissions from the operation and maintenance of pumps and generators during channel dewatering.

Conclusion

Program Renewal maintenance activities would comply with existing energy standards and for the reasons described above, would not conflict with a renewable energy or energy efficiency plan. Impacts would be **less than significant,** and no mitigation is required.

Mitigation Measures: No mitigation is required.

3.7 Greenhouse Gas Emissions

3.7.1 Introduction

This section presents the regulatory setting, environmental setting, and potential impacts of Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal) related to climate change and greenhouse gas (GHG) emissions.

Data sources used in the preparation of this section include state and federal regulations and reference materials from the California Air Resources Board (CARB) and the Bay Area Air District analyzes GHG impacts from Program Renewal maintenance activities.

3.7.2 Regulatory Setting

The following subsections discuss federal and state laws and regulations that pertain to climate change and GHG for the Program Renewal. Regional programs related to climate change and GHG are also presented below. Applicable regional and local plans, policies, and regulations or ordinances related to climate change and GHG are presented in **Appendix C**, *General Plan Policies and Ordinances*. In summary, Appendix C discusses several plans throughout the County and local jurisdictions that contain policies aimed at GHG emission reduction and adaptation to climate change. This includes policies aimed at GHG emissions reductions from mobile sources, reduction in vehicle miles traveled (VMT), increased use of renewable energy, water conservation, fire and flood planning as well as sea level rise planning, and transitioning to electrical vehicles and equipment.

Federal Plans, Policies, Regulations, and Laws

See Section 3.3, "Air Quality," for a full description on the Federal Vehicle Emission Standards, which are relevant to the GHG analysis.

State Plans, Policies, Regulations, and Laws

See Section 3.3, "Air Quality," for a discussion on transportation related standards and regulations that also relate to GHG emissions. These standards and regulations include the Advanced Clean Truck (ACT) Regulation, Advanced Clean Cars Program, Advanced Clean Fleets (ACF) Regulation, the In-Use Off-road Diesel-Fueled Fleets Regulation, Small Off- road Engine Regulations, and the Portable Equipment Registration Program.

Assembly Bill 32 and Senate Bill 32 – California Global Warming Solutions Act

In September 2006, then-Governor Schwarzenegger signed the California Global Warming Solutions Act (Assembly Bill [AB] 32). AB 32 (Health and Safety Code, Division 25.5) establishes regulatory, reporting, and market mechanisms to achieve quantifiable reductions in GHG emissions and establishes a cap on statewide GHG emissions. AB 32 required that statewide GHG emissions be reduced to 1990 levels by 2020. This reduction was intended to be accomplished by enforcing a statewide cap on GHG emissions that was phased in starting in 2012. To effectively implement the cap, AB 32 directed the California Air Resources Board (CARB) to develop and implement regulations to reduce statewide GHG emissions from stationary sources.

In 2016, Senate Bill (SB) 32 and its companion bill AB 197 amended Health and Safety Code, Division 25.5 Section 38500 et seq. and established a new GHG reduction target of 40 percent below 1990 levels by 2030, and 85 percent below 1990 levels for anthropogenic emission by 2045, with an aspirational goal of carbon neutrality by 2045. The bills also include provisions to ensure the benefits of state climate policies reach into disadvantaged communities.

Assembly Bill 1279

AB 1279 (2022) of 2022 (Health and Safety Code Section 38562.2) requires California to achieve net zero GHG emissions as soon as possible but no later than 2045 and maintain net negative GHG emissions thereafter. By 2045, anthropogenic GHG emissions must be reduced by at least 85 percent below 1990 levels.

2022 Scoping Plan for Achieving Carbon Neutrality

A specific requirement of AB 32 was to prepare a Climate Change Scoping Plan for achieving the maximum technologically feasible and cost-effective GHG emission reduction by 2020. CARB developed and approved the initial Scoping Plan in 2008, outlining the regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs that would be needed to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the state's long-range climate objectives (CARB 2009).

Most recently, CARB approved the 2022 *Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan) in December 2022. The 2022 Scoping Plan outlines the proposed framework of action for achieving the 2045 GHG target of an 85 percent reduction in anthropogenic GHG emissions relative to 1990 levels; the update also adds carbon neutrality as a science-based guide for California's climate work (CARB 2022). The 2022 Scoping Plan outlines how carbon neutrality can be achieved to reduce GHGs to meet the emission targets by reducing anthropogenic (human-caused) emissions and expanding actions to capture and store carbon. New to the 2022 Scoping Plan is a commitment to incorporate and quantify natural and working lands as a key component to GHG reductions and actions around capture and storage of carbon. The 2022 Scoping Plan strategy for meeting the state's 2030 GHG target incorporates the full range of legislative actions and state-developed plans that have relevance to the year 2030. The 2022 Scoping Plan is heading toward the 2045 anthropogenic target of 85 percent below 1990 levels and an aspirational goal of carbon neutrality, including the following reductions in key sectors relevant to the Program Renewal:

- The transportation sector targets reductions based on the technology of vehicles and associated refueling infrastructure for those vehicles; the fuel used as the energy source to power vehicles and the facilities that produce them; and vehicle miles traveled (VMT), which relates to development patterns and available transportation options.

  The electricity grid sector has a target of 38 million metric tons of carbon dioxide equivalents ($MMTCO_2e$) in 2030 and 30 $MMTCO_2e$ in 2035, which includes a goal of generating 20 gigawatts of offshore wind by 2045 and specifies that the increased demand for electrification occurs without new fossil gas–fired resources.

Natural and working lands sectors include targets to conserve natural working lands and coastal waters, and to implement actions to accelerate natural removal of carbon and improve resilience to climate change.

In the 2022 Scoping Plan, CARB recommends statewide targets of no more than 226 $MMTCO_2e$ from AB 32 GHG inventory sector emissions. For the 2045 scenario in the 2022 Scoping Plan, maximum GHG emissions from AB 32 inventory sector emissions are 65 $MMTCO_2e$.

Appendix D of the 2022 Scoping Plan provides guidance for GHG analyses in local agency California Environmental Quality Act (CEQA) documents. The guidance is focused on land use plans and projects, but some of it can also apply to water and infrastructure projects. In particular, Section 3.2.2 of the 2022 Scoping Plan generally endorses a net-zero threshold of significance, while noting that it may not be feasible or appropriate for every project. Also, Section 4.1 of the 2022 Scoping Plan recommends a "mitigation hierarchy" not found in the CEQA Guidelines. CARB recommends prioritizing CEQA GHG mitigation according to a geographic hierarchy and includes carbon offsets as an option.

Executive Order S-13-08 and SB 1320

Then-Governor Schwarzenegger signed Executive Order (EO) S-13-08 on November 14, 2008. The order called on state agencies to develop California's first strategy to identify and prepare for expected climate impacts. As a result, the *2009 California Climate Adaptation Strategy* (CAS) report was developed to summarize the best-known science on climate change impacts in the state, assess vulnerability, and outline possible solutions that can be implemented in and across state agencies to promote resiliency (California Natural Resources Agency [CNRA] 2009); it was updated in 2014, 2018, and 2021 (CNRA 2014, 2018, 2021). The fifth update is currently being prepared. The state has also developed an Adaptation Planning Guide (California Emergency Management Agency [CEMA] 2012) to provide a decision-making framework intended for use by local and regional stakeholders to aid in the interpretation of climate science and develop a systematic rationale for reducing risks caused or exacerbated by climate change. In 2020, SB 1320 codified the requirement for coordination with the California Governor's Office of Planning and Research (OPR) and CNRA, State Energy Resources Conservation and Development Commission, and the Strategic Growth Council to develop the California Climate Change Assessment at least every 5 years.

California's Wildfire and Forest Resilience Action Plan

The Wildfire and Forest Resilience Action Plan (Action Plan) (Forest Management Task Force 2021) is designed to strategically accelerate efforts to: restore the health and resilience of California forests, grasslands, and natural places; improve the fire safety of our communities; and sustain the economic vitality of rural forested areas. The Action Plan serves as a roadmap for implementing the Agreement for Shared Stewardship of California's Forest and Rangelands with the United States Forest Service, and for aligning the state's efforts with other federal, local, tribal, regional, and private organizations.

Renewables Portfolio Standard

The state of California adopted standards to increase the percentage of energy from renewable resources that retail sellers of electricity, including investor-owned utilities and

community choice aggregators, and it must be provided in their portfolio. The Renewables Portfolio Standard (RPS) was established in 2002 under SB 1078, accelerated in 2006 under SB 107, and expanded in 2011 under SB 2. The standards are referred to as the RPS. Qualifying renewables under the RPS include bioenergy such as biogas and biomass, small hydroelectric facilities (30 megawatts [MW] or less), wind, solar, and geothermal energy. The California Public Utilities Commission (CPUC) and California Energy Commission (CEC) jointly implement the RPS program.

In November 2008, then-Governor Schwarzenegger signed EO S-14-08, which expanded the State's RPS to 33 percent renewable power by 2020. In September 2009, then-Governor Schwarzenegger continued California's commitment to the RPS by signing EO S-21-09, which directed CARB to enact regulations to help the state meet its RPS goal of 33 percent renewable energy by 2020.

Senate Bill 350 Clean Energy and Pollution Reduction Act (SB 350)

SB 350, also known as the Clean Energy and Pollution Reduction Act of 2015, was enacted on October 7, 2015, and provides a new set of objectives in clean energy, clean air, and pollution reduction by 2030. The objectives include the following:

1. To increase the procurement of California's electricity from renewable sources from 33 percent to 50 percent by December 31, 2030.
2. To double the energy efficiency savings in electricity and natural gas final end uses (e.g., to heat and cool spaces, power appliances, power lights, and heat water) of retail customers through energy efficiency and conservation.

100 Percent Clean Energy Act (SB 100)

On September 10, 2018, then-Governor Brown signed SB 100, establishing that 100 percent of all electricity in California must be obtained from renewable and zero-carbon energy resources by December 31, 2045. SB 100 also creates new standards for the RPS goals that were established by SB 350 in 2015. Specifically, SB 100 increases required energy from renewable sources for both Investor-Owned Utilities and Publicly Owned Utilities from 50 percent to 60 percent by 2030. Incrementally, these energy providers are also required to have a renewable energy supply of 44 percent by 2024, and 52 percent by 2027. The updated RPS goals are considered achievable, since many California energy providers are already meeting or exceeding the RPS goals established by SB 350.

Clean Energy, Jobs, and Affordability Act (SB 1020)

SB 1020, also known as the Clean Energy, Jobs, and Affordability Act of 2022, establishes the requirement that eligible renewable resources and zero-carbon resources supply 90 percent of all retail sales of electricity to California end-use customers by December 31, 2035; 95 percent of all retail sales of electricity to California end-use customers by December 31, 2040; 100 percent of all retail sales of electricity to California end-use customers by December 31, 2045; and 100 percent of electricity procured to serve all state agencies by December 31, 2035. It also contains provisions for cooperation between CPUC and Independent System Operators (ISOs) providing electricity for the purpose of transmission planning by allowing the exchange of confidential business information without risk of public disclosure requirements.

Low Carbon Fuel Standard (Executive Order S-1-07)

The Low Carbon Fuel Standard (LCFS), established in 2007 through Executive Order S-1-07 and administered by CARB, requires producers of petroleum-based fuels to reduce the carbon intensity of their products that started with a 0.25-percent reduction in 2011 and culminated in a 10 percent total reduction in 2020. In September 2018, CARB extended the LCFS program to 2030, making significant changes to the design and implementation of the program, including a doubling of the carbon intensity reduction to 20 percent by 2030.

Petroleum importers, refiners, and wholesalers can either develop their own low carbon fuel products or buy LCFS credits from other companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas, and hydrogen.

Regional Programs

Bay Area Air District CEQA Air Quality Guidelines

In June 2010, the Bay Area Air Quality Management District (now Bay Area Air District) Board of Directors adopted CEQA thresholds of significance and an update of the CEQA Air Quality Guidelines, which included significance thresholds for GHG emissions based on the emission reduction goals for 2020 articulated by the California State Legislature in AB 32. These thresholds were revised in the Bay Area Air Quality Management District 2022 CEQA Guidelines for land use plans and projects,[1] shifting from a "brightline" threshold, which is a level of emissions not to exceed regardless of the size or scope of the project, to a threshold requiring either compliance with a prescriptive list of project design elements for buildings and transportation or consistency with a local GHG reduction strategy that meets the criteria cited in CEQA Guidelines Section 15183.5(b) (BAAQMD 2022).

Although the 2022 CEQA Guidelines recommend GHG thresholds of significance for land use plans and projects, they do not recommend GHG thresholds of significance directly relevant to the Program Renewal (i.e., for stream maintenance activities). The Bay Area Air Quality Management District's 2022 CEQA Guidelines discuss general GHG mitigation approaches for land use plans and projects, and for stationary sources, but do not specifically recommend GHG mitigation measures relevant to operational emissions from stream maintenance activities. The Bay Area Air Quality Management District notes that its guidelines are nonbinding recommendations intended to assist lead agencies, and they may be updated as needed in the future; any updates will also be nonbinding and advisory.

Valley Water Climate Change Action Plan

Valley Water's Climate Change Action Plan (CCAP) is Valley Water's guide to addressing climate change in its mission areas of water supply, flood protection, and ecosystem stewardship. This plan builds upon Valley Water's existing climate change efforts, such as reduction of Valley Water's greenhouse gas emissions and commitment to carbon neutrality, and adaptation of operations to the changing climate. Following an extensive stakeholder

[1] Land use projects are typical projects that develop land into residential, commercial, and government uses such as buildings and traffic improvements.

review process, the CCAP was adopted by Valley Water's Board of Directors on July 13, 2021 (Valley Water 2021).

The CCAP provides goals, strategies, and possible actions to address Valley Water's vulnerability to climate change impacts in each of Valley Water's mission areas, including water supply, flood protection, and ecosystem stewardship. There are seven goals in the CCAP to help guide Valley Water's response to climate change. The first three goals focus on the reduction of Valley Water's greenhouse gas emissions and the final four goals aim to help adapt to climate change. **Table 3.7-1** outlines the goals and strategies contained in the CCAP.

Table 3.7-1. Goals and Strategies from the Climate Change Action Plan

Goal / Strategies
Goal 1: Reduce Direct Greenhouse Gas Emissions
• Reduce GHG emissions associated with the Valley Water fleet
• Reduce GHG emissions from trips between Valley Water offices and work sites
• Reduce GHG emissions associated with Valley Water-owned equipment
• Minimize GHG emissions associated with planning, design, construction, operation, and maintenance of capital projects
• Increase GHG sequestration on Valley Water properties and other areas
• Continue to update Valley Water's GHG accounting practices
Goal 2: Expand Renewable Energy and Improve Energy Efficiency
• Continue to support increased renewable energy in the agency's energy portfolio
• Continue to support increased renewable energy in the agency's energy portfolio
• Continue to improve energy efficiency at agency facilities
Goal 3: Reduce Indirect Greenhouse Gas Emissions
• Reduce emissions from Valley Water employee commutes
• Reduce waste produced at facilities
• Continue to create and expand other efforts to minimize indirect emissions
Goal 4: Water Supply Adaptation
• Diversify local water supplies and expand drought-resistant water supply
• Improve demand management and increase water conservation efforts
• Increase reliability of imported water
• Support efforts to maintain and enhance source water quality
• Implement source water improvement and water treatment actions
• Increase flexibility and resilience of water utility operations and assets
• Support ecological water supply management objectives
Goal 5: Flood Protection Adaptation in Santa Clara County

Goal / Strategies
• Minimize riverine flooding risks
• Minimize flood risk in coastal areas
• Improve the flood preparedness of people, property, and habitat
• Implement projects and plans to increase the flexibility and resilience of flood protection operations and assets
• Expand the use of flood forecasting and modeling tools in the planning and design of agency projects to maximize protection from flood risks
Goals 6: Ecosystem Adaptation in Santa Clara County
• Expand the availability of data on regional ecosystems to avoid detrimental climate change-related ecosystem impacts
Goal 7: Emergency Preparedness
• Maximize Valley Water's emergency preparedness for climate-related impacts

Source: Valley Water 2021

Valley Water Ends Policy No. E-5

In July 2021, Valley Water's Board of Directors adopted the Climate Change Mitigation and Adaptation Ends Policy No. E-5: "Valley Water is carbon neutral and provides equitable, climate-resilient water supply, flood protection, and water resource stewardship to all communities in Santa Clara County. This will be accomplished through the implementation of the Climate Change Action Plan." Applicable goals and objectives are as follows:

CCMA GOAL 5.1: Minimize greenhouse gas emissions from Valley Water's operations.

CCMA Objective

5.1.1: Expand the use of clean technology in vehicles, equipment, and buildings, and develop carbon-efficient construction and service delivery practices.

5.1.2: Optimize energy use and expand renewable energy portfolio.

5.1.3.: Incentivize low carbon practices, projects, and efforts by employees, contractors, and partners. Adapt Valley Water's assets and operations to reduce climate change impacts.

CCMA GOAL 5.2: Adapt Valley Water's assets and operation to reduce climate change impacts.

CCMA Objective

5.2.1: Improve the resiliency of Santa Clara County's water supply to drought and other climate change impacts.

5.2.2: Provide equitable protection from sea level rise and flooding, prioritizing disadvantaged communities.

5.2.3: Improve ecosystem resiliency through water resources stewardship.

5.2.4: Prepare for climate-related emergencies and provide equal access to information and services, particularly to disadvantaged communities.

Valley Water Greenhouse Gas Reduction Plan

Valley Water is preparing a Greenhouse Gas Reduction Plan (GHGRP) that is consistent with the framework outlined under CEQA Guidelines Section 15183.5 and is anticipated to be adopted in 2025. An administrative draft of the GHGRP was released to the public in December 2024 (Valley Water 2024). The GHGRP provides an inventory of Valley Water's GHG emissions through 2021, a forecast of future GHG emissions, and a list of measures to achieve a goal of net zero emissions by 2045. It provides specific measures to reduce GHG emissions and metrics to measure progress and will be considered for adoption in a public process following preparation of a CEQA document analyzing potential environmental impacts of the GHGRP. Consistency with the GHGRP can be used in the future, once it is adopted and the CEQA document certified, to streamline CEQA compliance for future Valley Water projects.

Current reduction measures described in the GHGRP to achieve net zero emissions by 2045 include the following:

VF-1: Zero Emission On-Road Fleet: Convert 35% of on-road fleet fuel use to zero-emission fuels (e.g., electricity, renewable diesel, hydrogen) by 2030 and 100% by 2045.

OF-1: Zero Emission Off-Road Fleet: Convert 50% of Valley Water's off-road fleet conventional diesel use to zero-emission fuels by 2030 and 100% by 2045 regardless of engine tier.

HG-1: Phase Out High-GWP [-Global Warming Potential] Refrigerants: Replace high-GWP refrigerants with low-GWP alternatives above and beyond the requirements of SB 1206.

FE-1: Facility Electrification: Electrify 30% of existing facility natural gas use by 2030 and 60% by 2045.

EC-1: Reduce Employee Commute Emissions: Implement incentives to encourage employees to reduce their VMT or reduce emissions from their commute vehicles.

SW-1: Increase Solid Waste Diversion: Divert 80% of waste from Valley Water offices from landfills by 2030 and 90% by 2045. Improve solid waste tracking by conducting regular assessment of waste characterization.

CN-1: Zero Emission Off-Road Construction Equipment: For all contracted construction projects, require the use of zero-emission fuels (e.g., electricity, renewable diesel, biodiesel, hydrogen) instead of conventional diesel in 17% of off-road construction equipment fuel use in equipment greater than 25 hp [horsepower] by 2030 and 45% by 2045 regardless of the engine tier.

CN-2: Zero Emission On-Road Construction Vehicles: For all contracted construction projects, require the use of zero-emission fuels (e.g., electricity, renewable diesel, biodiesel, hydrogen) instead of conventional fuel in 35% of on-road construction vehicle fuel use by 2030 and 95% by 2045.

WA-1: Community-Wide Water Conservation: Conserve 96,800 acre-feet of water per year by 2030 and 118,000 acre-feet by 2045.

CS-1: Carbon Sequestration: Sequester carbon in habitat enhancement and restoration projects. Collaborate with regional conservation agencies to develop habitat enhancement and restoration above and beyond project mitigation requirements.

CS-2: Purchase Carbon Offsets: If necessary, purchase carbon offsets from verified offset registries prioritizing local or regional projects and, if necessary, projects outside of the state, but within the United States. Prohibit carbon offset purchases that are unverified or located in locations outside the United States.

3.7.3 Environmental Setting

This section discusses greenhouse gases and anticipated climate change conditions in the Program Renewal Area.

Greenhouse Gases and Climate Change

GHGs are gases that trap heat in the atmosphere by allowing sunlight to enter the atmosphere but trapping a portion of the outward-bound infrared radiation, which warms the air. The process is similar to the effect of greenhouses, which are used to grow plants year-round even during cold months. In greenhouses, the internal temperatures increase, and gases are trapped—thus the name "greenhouse gas."

Global climate change is the result of a change in the prevailing weather patterns on Earth that can be measured by wind patterns, storms, precipitation, and temperature. Climate change is a global problem, and GHGs are global pollutants, unlike criteria air pollutants (such as ozone precursors) and toxic air contaminants (TACs), which are pollutants of regional and local concern. Both natural processes and human activities emit GHGs. The natural accumulation of GHGs in the atmosphere regulates the Earth's temperature; however, emissions from human activities, such as fossil fuel–based electricity production and the use of internal combustion engines and motor vehicles, have elevated the concentration of GHGs in the atmosphere since the start of the industrial revolution. This human-caused (anthropogenic) accumulation of GHGs has contributed to an increase in the temperature of the Earth's atmosphere and has contributed to global climate change.

Although there is disagreement as to the rate of global climate change, multiple studies published in peer-reviewed scientific journals show that 97 percent or more of actively publishing scientists agree: climate-warming trends over the past century are very likely due to human activities (National Aeronautics and Space Administration 2015). Emissions of carbon dioxide (CO_2) and nitrous oxide (N_2O) are byproducts of fossil fuel combustion, but are also emitted from other sources, including cement manufacture and land use changes (such as converting grassland to urban development). Methane (CH_4), a highly potent GHG,

results from off-gassing associated with agricultural practices and landfills, as well as from incomplete combustion of fossil fuels.

The principal GHGs are CO_2, CH_4, N_2O, sulfur hexafluoride (SF_6), perfluorocarbons (PFCs), hydrofluorocarbons (HFCs), and nitrogen trifluoride (NF_3). CO_2 is the reference gas for estimating GHG emissions; that is, the global warming potential (GWP) of CO_2 is used as the standard by which other GHGs are measured. To account for the GWP of different GHGs, emissions are often quantified and reported as CO_2 equivalents (CO_2e), a measure of how much global warming a given type and mass of GHG may cause compared to the equivalent amount of CO_2. For example, SF_6 is a GHG commonly used in the utility industry as an insulating gas in circuit breakers and other electronic equipment. SF_6, while comprising a small fraction of the total GHGs emitted annually worldwide, is a much more potent GHG, with 22,800 times the GWP of CO_2. GHG emissions are commonly reported in units of metric tons, rather than the more common U.S. short tons, because GHG emissions are commonly compared on a global scale.

GWP ratios are provided by the Intergovernmental Panel on Climate Change (IPCC). Historically, GHG emission inventories were calculated using ratios from the IPCC's Second Assessment Report (SAR), published in 1996. The IPCC has since updated the ratios based on the latest science in its Fourth, Fifth, and Sixth Assessment Reports (IPCC 2007, 2015, 2022). CARB currently uses GWP ratios from the Fourth Assessment Report (IPCC 2007) for the statewide GHG emissions inventory (CARB 2024), as well as in the current version of the California Emissions Estimator Model (CalEEMod) (California Air Pollution Control Officers Association 2022) that was used to calculate CO_2e values for the Program Renewal. Compounds that are regulated as GHGs are discussed in more detail below.

Carbon Dioxide

In the atmosphere, carbon generally exists in its oxidized form as CO_2. Natural sources of CO_2 include the respiration (breathing) of humans, animals, and plants; volcanic outgassing; decomposition of organic matter[2], and; and evaporation from the oceans. Human-caused sources of CO_2 include the combustion of fossil fuels and wood, waste incineration, mineral production, and deforestation. Natural CO_2 removal processes, such as photosynthesis by land- and ocean-dwelling plant species, cannot keep pace with this extra input of human-made CO_2; consequently, the gas is building up in the atmosphere. CO_2 accounted for approximately 80 percent of anthropogenic GHG emissions in California in 2019 (CARB 2022).

Methane

CH_4 is produced when organic matter decomposes in environments lacking sufficient oxygen. Natural sources include wetlands, termites, and oceans. Decomposition occurring in landfills accounts for the majority of human-generated CH_4 emissions in California and in the United States as a whole. Agricultural processes such as intestinal fermentation in animals, manure management, and rice cultivation are also large sources of CH_4 in California. Methane is also

[2] Organic matter is matter composed of organic compounds that come from the remains of organisms such as plants and animals.

released at points of natural gas extraction and in leakages throughout the gas pipeline system.

The GWP of CH_4 is considered by CARB to be approximately 25 times that of CO_2 as averaged over a 100-year timescale. On this timescale, CH_4 accounted for approximately 9 percent of anthropogenic GHG emissions in California in 2019 (CARB 2022). However, because CH_4 breaks down rapidly into CO_2 and water once in the atmosphere, there is growing recognition among climate scientists that a 20--year time horizon is more relevant. The 20-year GWP of CH_4 is between 84 and 87 times greater than that of CO_2. That means methane is a much larger contributor to California's anthropogenic GHG emissions over the shorter time frame of 20 years than originally calculated over 100 years.

Nitrous Oxide

N_2O is produced naturally by a wide variety of biological sources, particularly microbial action in soils and water. Tropical soils and oceans account for the majority of natural source emissions. N_2O is a product of the reaction that occurs between nitrogen and oxygen during fuel combustion. Both mobile and stationary combustion emit N_2O, and the quantity emitted varies according to the type of fuel, technology, and pollution control device used, as well as maintenance and operating practices. Agricultural soil management and fossil fuel combustion are the primary sources of human-generated N_2O emissions in California. N_2O has a GWP of approximately 298 times that of CO_2, and its emissions accounted for approximately 3 percent of anthropogenic GHG emissions in California in 2019 (CARB 2022).

Hydrofluorocarbons, Perfluorocarbons, and Sulfur Hexafluoride

HFCs are primarily used as substitutes for ozone-depleting substances and have global warming potentials that range from hundreds to thousands of times that of CO_2. PFCs and SF_6 are emitted from various industrial processes, including semiconductor manufacturing and electric power transmission and distribution. These accounted for approximately 6 percent of anthropogenic GHG emissions in California in 2019 (CARB 2022).

Nitrogen Trifluoride

NF_3 is primarily used in manufacturing semiconductor and liquid crystal display (LCD) panels, certain types of solar panels, and chemical lasers. The ability to measure NF_3 atmospheric concentrations has only recently become possible, and this has revealed much higher concentrations than originally assumed. This is a major cause of concern because NF_3 is an extremely potent GHG and has a GWP of 17,200 times that of CO_2 (WRI and WBCSD 2013).

Effects of Climate Change

Climate change refers to any significant change in measures of climate (such as temperature, precipitation, or wind) lasting for an extended period (decades or longer). The scientific community's understanding of the fundamental processes responsible for global climate change has improved over the past decade, and its predictive capabilities are advancing. However, there remain significant scientific uncertainties in, for example, predictions of the following: local effects of climate change; occurrence, frequency, and magnitude of extreme

weather events; effects of aerosols; changes in clouds; shifts in the intensity and distribution of precipitation; and changes in oceanic circulation.

For California, projected effects from climate change are described in California's Fourth Climate Change Assessment (California Climate Change Center [CCCC] 2019). Based on projections using climate modeling, temperatures in California are expected to rise between 5.6 degrees Fahrenheit (°F) and 8.8°F above year 2000 averages by 2050 (CCCC 2019). The predicted changes in the future climate have been found to affect the natural environment in California in the following ways (CCCC 2012, 2019):

- Increased wildfire risk and wildfire severity;
- Adverse effects on native freshwater fish species;
- Increased ground-level ozone levels and particulate air pollution;
- Earlier snowmelt and runoff;
- Faster-than-historical sea level rise and increased coastal flooding; and
- Impacts on the agricultural industry from population decreases of pollinators and increases of pests and disease.

These changes in California's climate and ecosystems are projected to occur because California's population is expected to increase from 40 million in 2020 to 45 million by 2050 (California Department of Finance [CDF] 2023a). As the population increases, the demand for transportation, water, and electrical utilities, as well as other commodities, will increase correspondingly, resulting in an increase in the amount of anthropogenic GHG emissions anticipated under a "business as usual" scenario.

Although the possible outcomes and the feedback mechanisms involved are not fully understood and much research remains to be done, the potential for substantial environmental, social, and economic consequences over the long term may be substantial. All of these impacts would have either direct or indirect adverse effects for the residents and businesses in and near the Program Renewal Area.

Emissions Inventories

An emissions inventory that identifies and quantifies the primary human-generated sources and sinks (things that absorb more carbon than they release, such as plants, ocean, and soil) of GHGs is a well-recognized and useful tool for addressing human society's contributions to climate change. This section summarizes the latest information on global, United States, California, and local GHG emission inventories available at the time of Draft EIR preparation.

U.S. Emissions

In 2022, the United States emitted about 5,489 $MMTCO_2e$ after accounting for land sequestration.[3] Of the major sectors nationwide, transportation accounted for the highest amount of GHG emissions (approximately 28 percent), followed by electricity (25 percent), industrial (23 percent), commercial and residential (13 percent), and agriculture

[3] Land sequestration is the storage of carbon and nitrogen that is stored for a period of time in the land, such as in the roots and vegetation of plants or absorbed in water in the ocean.

(10 percent). Between 1990 and 2022, total net U.S. GHG emissions decreased by 2 percent. Since peaking in 2005, total net emissions have decreased by about 17 percent (U.S. Environmental Protection Agency [USEPA] 2024).

State of California Emissions

CARB compiles GHG inventories for the State of California. Based on CARB's 2022 GHG inventory data, California emitted 371.1 $MMTCO_2e$, including emissions resulting from imported electrical power (CARB 2024). Between 1990 and 2022, the population of California grew by approximately 9.7 million (from 29.8 to 39.1 million) (CDF 2023a), representing an increase of approximately 31 percent from 1990 population levels. In addition, the California economy, measured as gross state product, grew from $773 billion in 1990 to $3.60 trillion in 2022, representing an increase of approximately 365 percent (over four times the 1990 gross state product) (CDF 2023b). Despite this population and economic growth, CARB's 2022 statewide inventory indicates that California's net GHG emissions in 2022 were below 1990 levels of 431 $MMTCO_2e$, which was the 2020 GHG reduction target codified in Health and Safety Code, Division 25.5, also known as the Global Warming Solutions Act of 2006 (AB 32). The 2022 data continued to show a long-term trend of decreasing GHG emissions and showed that emissions were 9.3 $MMTCO_2e$ lower than 2021.

Valley Water Emissions

The most recent final emissions inventory for Valley Water is presented in the 2021 Climate Change Action Plan, which summarizes GHG emissions and offsets from 2010 to 2017. **Table 3.7-2** shows that, since 2014, the CCAP concludes that Valley Water has achieved carbon neutrality.

Table 3.7-2. Valley Water Estimated GHG Emissions and Offsets 2010-2017

Calendar Year	2010	2011	2012	2013	2014	2015	2016	2017

3.7.4 Impact Analysis

Methodology

The baseline that was used for the GHG emissions analysis is the existing GHG emission levels generated by the current Stream Maintenance Program (SMP-2) activities. To the extent that new areas have been added for the Program Renewal, as well as the addition of new types of treatments requiring new pieces of equipment, an incremental increase in GHG emissions would result to potentially new and existing sensitive receptors compared to the existing baseline condition.

Although Program Renewal activities would be countywide, transitory, and short term, similar to construction activities, they would serve the purpose of maintaining existing features rather than constructing new features. Therefore, as discussed in Section 3.3, "Air Quality," the Bay Area Air District has indicated that emissions resulting from Program Renewal activities would be considered operational emissions for the purposes of estimating air quality impacts. GHG emissions from Program Renewal activities were estimated for two sources: off-road vehicles and on-road vehicles.

Off-road vehicle and on-road vehicle emissions were estimated using CalEEMod version 2022.1.1.29 (CAPCOA 2022). Information on equipment size and activity for 2023 was provided by Valley Water. It was assumed that equipment used currently, and in the future, will be Tier 4 final engines for off-road equipment. Valley Water indicated that some of their equipment in the past used liquefied petroleum gas (LPG). LPG was not incorporated into the analysis since the CalEEMod GHG emissions model does not include default emission factors for these pieces of equipment; instead, equipment using LPG was treated as being diesel equipment. Based on the change from existing (SMP-2) miles for a 7-year period to the Program Renewal's miles treated for a 10-year period, a factor of 1.29 was used to scale up the activity of the equipment and vehicles unless other information about future activity was provided by Valley Water. Details of the CalEEMod inputs and outputs are found in **Appendix D**, *Air Quality and Greenhouse Gas Emission Calculations,* for both current SMP-2 and Program Renewal scenarios.

The GHG emissions from pesticide use under the Program Renewal would be extremely small in the context of the overall Program emissions. Therefore, they were not included in the emissions calculations and are not anticipated to result in any material change in the magnitude of the impact.

The existing SMP-2 emissions are subtracted from the anticipated Program Renewal emissions to provide the incremental change in emissions from baseline. The incremental change from the existing baseline conditions is the Program Renewal impact used to make a comparison to the CEQA significance thresholds.

Criteria for Determining Significance

For the purposes of this analysis, the Program Renewal would result in a significant impact on global climate change if it would:

A. generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or

B. conflict with an applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

Note that emissions associated with the Program Renewal were estimated for the various maintenance activities as a whole; for this reason, the impact discussion in this section is not broken down by the individual activities.

The Bay Area Air Quality Management District CEQA Air Quality Guidelines (BAAQMD 2023) do not contain any quantitative significance thresholds for operational GHG emissions or prescriptive measures for infrastructure projects since Valley Water did not have an adopted qualified GHGRP at the time of Draft EIR preparation. The Bay Area Air District does not have any guidance for analyzing operational emissions for projects that are not land use projects, stationary sources, or under a local GHG reduction strategy.

The impact analysis evaluates whether implementation of the Program Renewal would result in significant impacts related to GHG levels based on the anticipated maintenance activities required for the Program Renewal. For Impact GHG-1, the SEIR uses a net-zero threshold, which is conservative and consistent with Scoping Plan guidance. For Impact GHG-2, the GHG emissions are compared to the GHG reduction targets set forth in SB 32 and applicable strategies outlined in the latest Scoping Plan.

Environmental Impacts

Impact GHG-1: Generate GHG Emissions, Either Directly or Indirectly, that may have a Significant Impact on the Environment (Less than Significant with Mitigation)

Use of vehicles and equipment for Program Renewal maintenance activities would require fossil fuel combustion that would generate GHG emissions. This analysis considers emissions from both existing SMP-2 activities (which are used as the existing conditions baseline) and additional emissions resulting from implementation of the Program Renewal. **Table 3.7-3** summarizes annual emissions estimates for the existing SMP-2 and for the Program Renewal. For additional information on how emissions were estimated refer to Appendix D.

Table 3.7-3. Existing and Program Renewal Proposed Annual CO_2e Emissions

Emissions Source	Existing Estimated Emissions	SMP-3 Proposed Estimated Emissions
Off-Road & On-Road	2,841	3,673
Pesticide Use	-	-
Total	*2,841*	*3,673*
Bay Area Air District Threshold	None	None

Note: All emission estimates are in metric tons per year.

Source: Appendix D, Air Quality and Greenhouse Gas Emission Calculations

Table 3.7-3 shows that annual emissions from the Program Renewal would increase because of updated projections, which was accounted for using an additional 1.29 factor to reflect the estimated increase of work to be completed. The net increase in GHG emissions for the Program Renewal compared to existing SMP-2 GHG emissions is 832 $MTCO_2e$ per year, conservatively based on using 2026 emission factors. Future emission factors are anticipated to decrease and this would decrease the estimated emissions.

The rate of CO_2e emissions would decrease between 2027 and 2036, primarily because of Valley Water's tiered vehicle and equipment replacement programs that are consistent with its CCAP. Nevertheless, the Program Renewal would generate additional GHG emissions, which would have a significant impact on the environment.

Applicable Best Management Practices

The BMPs summarized below would be implemented as part of Program Renewal to reduce GHG emissions during maintenance activities, although to the exact extent cannot be quantified. Full descriptions of each BMP are provided in Chapter 2, *Project Description*.

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of the work area, staging areas, and access routes are kept to the minimum area necessary to complete maintenance work to minimize the amount of GHG emissions.
- **BMP GEN-37: Vehicle and Equipment Maintenance** will ensure that vehicles and equipment are properly maintained so that GHG emissions are reduced.
- **BMP GEN-42: Pump/Generator Operations and Maintenance** will ensure that pumps and generators will be sufficiently maintained and operated so that impacts to water quality and aquatic species emissions are minimized. Generators will be stored and operated with secondary containment. Implementation of these measures will reduce the amount of exposure of exhaust emissions from the operation and maintenance of pumps and generators during channel dewatering.

Conclusion

Table 3.7-3 shows that annual emissions of GHGs from Program Renewal would increase compared to existing GHG emissions. Since there is an increase in the future GHG emissions even with implementation of BMPs, this would be a **significant impact.**

Implementation of mitigation measures would reduce the impacts from GHG emissions. Implementation of **Mitigation Measure GHG-1** would require Valley Water's contractors to implement mobile source GHG emission reduction measures. However, it was uncertain at the time of Draft EIR preparation to what extent some of the off-road and on-road equipment and vehicles would be able to be used in remote areas where electricity supply and infrastructure for electric vehicles may not be readily available or practical.

Through implementation of **Mitigation Measure GHG-2,** Valley Water would use emissions credits to offset net GHG emissions from the Program Renewal that are not demonstrated to be reduced by Mitigation Measure GHG-1.

While the effectiveness of implementing Mitigation Measure GHG-1 was unknown at the time of Draft EIR preparation, Mitigation Measure GHG-2 requires Valley Water to purchase offsets for net emissions from Program Renewal activities not demonstrated to be reduced by Mitigation Measures GHG-1 or reduced by a future qualified GHGRP. Therefore, with the use of offsets, the impact of GHG emissions would meet the net zero threshold. As a result, impacts from GHG emissions after implementation of Mitigation Measures GHG-1 and GHG-2 are **less than significant with mitigation**.

Mitigation Measure GHG-1: GHG Emissions Reduction Practices for Maintenance Activities

Valley Water shall require the contractor to implement mobile source and other GHG emission reduction measures. All requirements shall be included in applicable bid documents, purchase orders, and constructs, with the contractors demonstrating the ability to supply the compliant on- or off-road construction equipment for use prior to any ground-disturbing and maintenance activities. The measures to include are as follows:

- Use zero-emission and hybrid-powered equipment to the greatest extent possible, provided adequate electricity supply and infrastructure is available in the planned work area. The performance criteria for meeting this standard are that at least two commercial rental facilities in the San Francisco Bay Area Air Basin are available, and that electricity and charging infrastructure be located near the planned work area.
- Require that all on-road heavy-duty trucks to meet the most stringent emissions standard as a condition of contract; this currently means that trucks need to be a 2015 model year (or newer).
- Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to no more than two minutes. Provide clear signage that posts this requirement for workers at the entrances to the site.
- Use CARB-approved renewable diesel fuel R99 or R100 in off-road construction equipment and on-road trucks.
- Use USEPA SmartWay certified trucks for deliveries and equipment transport.
- Require that all construction equipment be maintained and properly tuned in accordance with manufacturer's specifications. Equipment should be

checked by a certified mechanic in accordance with the manufacturer's specifications and determined to be running in proper condition prior to operation.

- Encourage and provide carpools, shuttle vans, transit passes, and/or secure bicycle parking to construction workers, and offer meal options on site or shuttles to nearby meal destinations for construction employees.
- Recycle or salvage nonhazardous construction and demolition debris.
- Develop a plan to efficiently use water for adequate dust control because substantial amounts of energy can be consumed during the pumping of water.

Mitigation Measure GHG-2: GHG Emissions Mitigation Program

Valley Water will purchase emissions credits annually to offset GHG emissions increases from the Program Renewal. The total credits will be equal to the annual increase in emissions compared to the current SMP-2, which would be approximately 832 $MTCO_2e$ per year, reduced by any annual emissions reductions from implementing Mitigation Measure GHG-1 that can be demonstrated.

Valley Water will prioritize purchase of offsets that are not "otherwise required" (CEQA Guidelines Section 15126.4(c)(3)) using the following preference hierarchy: within the San Francisco Bay Area Air Basin, originating within California, and originating in other states with offset laws at least as strict as California's. However, all offset credits shall meet the following validation criteria as defined by 17 CCR 95802: the offset credits must be real, permanent, quantifiable, verifiable, enforceable, and additional. Offset protocols must also be consistent with CARB requirements under 17 CCR 95972. Offset credits shall be registered with a recognized and reputable carbon registry (e.g., Climate Action Reserve, the American Carbon Registry, or Verra).

Valley Water will maintain documentation of any GHG offsets, ensuring that the offsets are real, permanent, quantifiable verifiable, enforceable, and additional. If in the future Valley Water approves a qualified GHGRP consistent with CEQA Guidelines Section 15183.5(b) and the Program Renewal is demonstrated to be consistent with the GHGRP, then the annual requirements for offsets may be replaced by implementing applicable measures in the GHGRP.

Impact GHG-2: Conflict with an Applicable Plan, Policy, or Regulation of an Agency Adopted for the Purpose of Reducing the Emissions of GHGs (Less than Significant with Mitigation)

Implementation of the Program Renewal would result in GHG emissions as shown in Table 3.7-3. The overall goal of SB 32 and AB 1279 is to have a net decrease in GHG emissions, so the Program Renewal's increase in GHG emissions would be inconsistent this goal, which is a significant impact. Mitigation Measure GHG-1 would reduce Program Renewal GHG emissions, but the extent of this reduction is currently unknown. Mitigation Measure GHG-2 would include purchase of offsets as necessary to ensure a net zero increase in GHG emissions for the Program Renewal. Thus, the Program Renewal with mitigation would be consistent with the GHG reduction targets of SB 32 and AB 1279. Similarly, the Program Renewal with

mitigation would be consistent with California's 2022 Scoping Plan policies and goals, which are based on achieving SB 32 and AB 1279 emissions reduction targets. The Program Renewal will enhance several maintenance programs to assist with adaptation plans including vegetation management and downed tree management maintenance activities.

Various local general plans, climate action plans, and sustainability plans as discussed in Section 3.7.2 above and Appendix C contain goals and policies aimed at reducing GHG emissions and preparing for climate change impacts. Many of these policies encourage reduction of VMT from vehicles and use of alternative fueled and/or electric vehicles and equipment. Valley Water's alternative fueled vehicles currently consist of 15 percent hybrid vehicles and 2 percent electric vehicles compared to the total vehicle fleet and most of the hand tools are electric as well as some of the lawn maintenance equipment (Lewis, pers. comm., 2024). This indicates that Valley Water has made strides toward zero-emission vehicles (ZEVs) and equipment which are expected to increase in the future, so the Program Renewal would generally be consistent with local plans and policies for reducing GHG emissions. Note that a program or project is consistent with a local general plan if, considering all its aspects, it will further the objectives and policies of the general plan and not obstruct their attainment; consistency with each local policy is not required. (See, e.g., Friends of Lagoon Valley v. City of Vacaville, 154 Cal.App.4th 807 (2007)).

The Valley Water CCAP provides goals, strategies, and possible actions to reduce its GHG emissions and address the ways that Valley Water is vulnerable to climate change impacts in each of Valley Water's mission areas, including water supply, flood protection, and ecosystem stewardship (Valley Water 2021). The CCAP sets seven goals to guide Valley Water's response to climate change. The Program Renewal's maintenance activity consistency with applicable CCAP strategies is demonstrated in **Table 3.7-4**. As shown therein, Program Renewal maintenance activities would be consistent with, and not conflict with, the Valley Water CCAP.

Based on the above analysis, impacts related to conflicts with GHG emissions reduction plans would be less than significant with implementation of Mitigation Measures GHG-1 and GHG-2.

Table 3.7-4. Valley Water CCAP Strategies Consistency Analysis

Goals	Strategy No. and Description	Program Renewal Consistency
Goal 1: Reduce Direct GHG Emissions	1.1 Reduce GHG emissions Associated with the Valley Water fleet	Consistent. Maintenance equipment and fleets would reduce emissions through the use of engine electrification (including hybrid equipment), the use of renewable fuels where possible, and reduced idling time/equipment operation time. These actions would reduce GHG emissions from project construction equipment fleet.
	1.2 Reduce GHG emissions from trips between Valley Water offices and work sites.	Consistent. Program Renewal activities would utilize maintenance routes that minimize GHG emissions.
	1.3 Reduce GHG emissions associated with valley Water-owned equipment	Consistent. Valley Water already uses electric, hybrid, and alternatively fueled

Goals	Strategy No. and Description	Program Renewal Consistency
		equipment for Program activities and will continue to expand these under Mitigation Measure GHG-1.
	1.4 Minimize GHG emissions associated with planning, design, construction, operation, and maintenance of capital projects.	Consistent. Maintenance equipment and fleets would reduce emissions through the use of engine electrification (including hybrid equipment), the use of renewable fuels where possible, and reduced idling time/equipment operation time. These actions would reduce GHG emissions from the Program Renewal maintenance equipment fleet.
Goal 3: Reduce Indirect GHG Emissions	3.3 Create and expand other efforts to minimize indirect GHG emissions	Consistent. Valley Water's commitment to renewable energy sources minimizes indirect GHG emissions.

Applicable Best Management Practices

The BMPs summarized below would be implemented as part of the Program Renewal to reduce GHG emissions during maintenance activities, although to the exact extent cannot be quantified. Full descriptions of each BMP are provided in Chapter 2, *Project Description*.

- **BMP GEN-4: Minimize the Area of Disturbance** will ensure that the footprint of the work area, staging areas, and access routes are kept to the minimum area necessary to complete maintenance work to minimize the amount of CO_2e emissions and therefore reduce the amount of GHG emissions.

- **BMP GEN-37: Vehicle and Equipment Maintenance** will ensure that vehicles and equipment are properly maintained so that the release of CO_2e emissions are reduced and therefore GHG emissions are reduced.

- **BMP GEN-42: Pump/Generator Operations and Maintenance** will ensure that pumps and generators will be sufficiently maintained and operated so that impacts to water quality and aquatic species emissions are minimized. Generators will be stored and operated with secondary containment. Implementation of these measures will reduce the amount of exposure of exhaust emissions from the operation and maintenance of pumps and generators during channel dewatering.

Conclusion

In conclusion, since the Program Renewal GHG emissions increases would conflict with the emissions reduction goals of SB 32, AB 1279, and the 2022 Scoping Plan, the impact is significant. Mitigation Measures GHG-1 and GHG-2 will reduce the amount of GHG emissions to a net zero increase with reductions in maintenance activity emissions and the use of offsets. Thus, the potential for conflicts with SB 32, AB 1279, and the 2022 Scoping Plan would be **less than significant with mitigation**.

Mitigation Measures: See Mitigation Measures **GHG-1** (**GHG Emissions Reduction Practices for Maintenance Activities)** and **GHG-2** (**GHG Emissions Mitigation Program)** above.

3.8 Hazards and Hazardous Materials

3.8.1 Introduction

This section presents the regulatory setting, environmental setting, and potential impacts of Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal) related to hazards and hazardous materials. Program Renewal activities may involve the use of hazardous materials (such as those used for maintenance equipment), involve work within areas of existing contamination, or could have impacts related to other types of hazard issues such as mosquitoes, emergency response, and pesticide use. Data resources used in the preparation of this section included the State Water Resources Control Board's (SWRCB's) GeoTracker, and the California Department of Toxic Substances Control's (DTSC's) EnviroStor database. Impacts related to wildland fires are discussed in Section 3.15, "Wildfire."

3.8.2 Regulatory Setting

The following subsections discuss federal, state, and regional laws and regulations that pertain to hazards and hazardous materials for the Program Renewal. Applicable local plans, policies, regulations, or ordinances related to hazards and hazardous materials are included in Appendix C, *General Plan Policies and Ordinances*. In summary, Appendix C discusses several plans throughout Santa Clara County (County) and local jurisdictions that contain relevant programs, strategies, policies, and goals to manage hazardous materials safely and efficiently, and to plan for emergency access and evacuation in the event of a hazardous materials incident.

Federal Plans, Policies, Regulations, and Laws

Comprehensive Environmental Response, Compensation, and Liability Act

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA, also called the Superfund Act) (42 U.S. Government Code [USC] Section 9601 et seq.) is intended to protect the public and the environment from the effects of past hazardous waste disposal activities and new hazardous material spills. Under CERCLA, the U.S. Environmental Protection Agency (USEPA) has the authority to seek out the parties responsible for hazardous materials releases and to assure their cooperation in site remediation. CERCLA also provides federal funding (the "Superfund") for the remediation of hazardous materials contamination (USEPA 2024a). The Superfund Amendments and Reauthorization Act of 1986 (Public Law 99-499) amends some provisions of CERCLA and provides for a Community Right-to-Know program.

USEPA has the authority to implement CERCLA in all 50 states and all U.S. territories, using a variety of enforcement tools. The identification, monitoring, and remediation of Superfund sites are usually coordinated by state environmental protection and/or waste management agencies.

When potentially responsible parties cannot be identified or located, or when responsible parties fail to act, USEPA has the authority to remediate abandoned and/or historical sites

where hazardous materials contamination is known to exist and to pose a human health hazard.

Pursuant to CERCLA, USEPA maintains National Priorities List of uncontrolled or abandoned hazardous waste sites identified for priority remediation under the Superfund program. Sites are identified for listing based on USEPA's hazard ranking system or if they meet certain other requirements.

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) (42 USC Section 6901 et seq.) was enacted in 1976 as an amendment to the Solid Waste Disposal Act to address the nationwide generation of municipal and industrial solid waste. RCRA gives USEPA the authority to control the generation, transportation, treatment, storage, and disposal of hazardous waste, including underground storage tanks storing hazardous substances. RCRA also establishes a framework for the management of nonhazardous wastes (USEPA 2024b). RCRA addresses only active and future facilities; it does not address abandoned or historical sites, which are covered by CERCLA (see preceding discussion).

RCRA was updated in 1984 by the passage of the federal Hazardous and Solid Waste Amendments (HSWA), which require the gradual phasing out of land disposal of wastes. HSWA also increased the USEPA's enforcement authority and established more stringent hazardous waste management standards, including a comprehensive underground storage tank program.

Federal Insecticide, Fungicide, and Rodenticide Act

The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) (7 USC 136 et seq.) was enacted in 1947. The purpose of FIFRA is to establish federal jurisdiction over the distribution, sale, and use of pesticides. Key provisions of FIFRA require pesticide applicators to pass a licensing examination for status as "qualified applicators," create a review and registration process for new pesticide products and provide thorough and understandable labeling that includes instructions for safe use.

Occupational Safety and Health Administration

The Occupational Safety and Health Administration (OSHA) is responsible at the federal level for ensuring worker safety. OSHA sets federal standards for implementation of workplace training, exposure limits, and safety procedures for the handling of hazardous substances (as well as other hazards). These standards, codified in 29 Code of Federal Regulations (CFR) Part 1910, address issues that range in scope from walking and working surfaces, to exit routes and emergency planning, to hazardous materials and personal protective equipment (PPE). They include exposure limits for a wide range of specific hazardous materials, as well as requirements that employers provide PPE to their employees wherever it is necessary (29 CFR Section 1910.132).

U.S. Department of Transportation Hazardous Materials Transportation Act

The U.S. Department of Transportation (U.S. DOT) Hazardous Materials Transportation Act (HMTA) (49 USC Chapter 51) was enacted in 1975 and regulates interstate transport of

hazardous materials and wastes. The HMTA specifies driver training requirements, load labeling procedures, and container design and safety requirements. Transporters of hazardous wastes must also meet the requirements of other statutes, such as the RCRA. The HMTA requires that carriers report accidental releases of hazardous materials to the U.S. DOT at soon as is practical. Incidents that must be reported include deaths, injuries requiring hospitalization, and property damage exceeding $50,000. The U.S. DOT, the Federal Highway Administration, and the Federal Railroad Administration are the agencies responsible for administering the Hazardous Materials Transportation Act. This law may apply to the transportation of hazardous materials to or from the Program Renewal work sites if such materials are identified or required as part of construction or maintenance activities.

State Plans, Policies, Regulations, and Laws

California state regulations, which are equal to or more stringent than federal regulations, require those handling hazardous wastes to plan for and manage waste with proper handling, storage, and disposal, so that risks to human health and the environment will be reduced.

Hazardous Waste Control Act of 1972

The Hazardous Waste Control Act of 1972 created the state's Hazardous Waste Management Program, which is similar to but more stringent than the federal program under RCRA. The Hazardous Waste Control Act is implemented at the state-level by regulations contained in Title 26 of the California Code of Regulations. Regulations in 26 Cal. Code of Regs. list more than 800 materials that may be hazardous and establish criteria for their identification, packaging, and disposal. Under the Hazardous Waste Control Act and 26 Cal. Code Regs., hazardous waste generators must complete a manifest that accompanies the waste from the generator to the transporter to the ultimate disposal location. Copies of the manifest must be filed with the DTSC.

California Department of Pesticide Regulation, Pesticides and Pest Control Operations

USEPA has delegated primary authority to the California Department of Pesticide Regulation (CDPR) to enforce federal and state laws pertaining to the proper and safe use of pesticides (CDPR 2024a). However, County Agricultural Commissioners (CACs) and their staffs are largely responsible for the in-field enforcement of CDPR's pesticide use regulations in California's 58 counties. Personnel from CDPR's headquarters and CDPR field staff provide training, coordination, technical, and legal support to the counties.

Title 3 – Food and Agriculture, Division 6, Pesticides and Pest Control Operations in the Cal. Code of Regs. describes the role of CDPR and provides guidance related to pesticide regulatory programs; pesticides (including pesticide registration and the identification and use of restricted materials); licensing, work requirements, and worker protections program; and environmental protection for groundwater, air quality, aquatic and marine environments, surface water, and compost (CDPR 2024b). CACs, on behalf of CDPR, are responsible for the in-field enforcement of these various human health and environmental protections from pesticides.

General NPDES Aquatic Pesticide Use Permit for Aquatic Weed Control

The SWRCB has adopted a general National Pollutant Discharge Elimination System (NPDES) permit (Water Quality Order No. 2013-002-DWQ, General Permit No. CAG990005) for the regulation of aquatic pesticides to control aquatic weeds in waters of the United States (SWRCB 2016). This General NPDES permit currently only authorizes the discharge of the following aquatic pesticides: 2,4-D, acrolein, calcium hypochlorite, copper, diquat, endothall, fluridone, glyphosate, imazamox, imazapyr, penoxsulam, sodium carbonate peroxyhydrate, sodium hypochlorite, triclopyr-based aquatic algaecides and aquatic herbicides, and adjuvants containing ingredients using the surrogate nonlyphenol. Aquatic pesticides that are applied to waters of the United States in accordance with FIFRA label requirements are not considered pollutants. However, pesticides or by-products that persist in or leave the treatment area after a specified treatment period are considered pollutants and require coverage under this General Permit.

To obtain coverage under the General NPDES permit, a discharger must comply with all of the monitoring, reporting, and other restrictions detailed in the permit. First, an applicant must submit a Notice of Intent, a vicinity map, and an annual fee to the applicable Regional Water Quality Control Board (RWQCB) to apply for coverage under the permit. An applicant must comply with the specific monitoring requirements identified in the permit and must submit annual reports (at the least) to the applicable RWQCB. The General NPDES permit for weed control requires that dischargers comply with effluent limitations, including developing and implementing an Aquatic Pesticide Application Plan (APAP), and complying with applicable receiving water limitations (SWRCB 2016). Valley Water developed an APAP in 2013 that guides Valley Water's use of algaecides and aquatic herbicides in accordance with the General NPDES permit and updated this APAP in 2022 (Valley Water 2022). A discharger covered by the permit must follow all pesticide label instructions and any terms contained in Use Permits issued by CACs. In addition, applicators of a pesticide designated as a restricted material must either be licensed by CDPR or must work under the supervision of a licensed professional (SWRCB 2016). All aquatic pesticides applied by Valley Water under the General NPDES permit are done so in accordance with the permit requirements.

California Emergency Services Act

Under the Emergency Services Act of 2015, the State of California developed an emergency response plan to coordinate emergency services provided by federal, state, and local agencies. Rapid response to incidents involving hazardous materials or hazardous waste is an important part of the plan, which is administered by the California Office of Emergency Services (Cal OES). This office coordinates the responses of other agencies, including USEPA, the California Highway Patrol (CHP), the nine RWQCBs, the various air quality management districts, and county disaster response offices.

California Occupational Safety and Health Administration Standards

Title 8 of the California Occupational Safety and Health Administration (Cal/OSHA) regulations specifies that workers who may be exposed to contaminated soils and vapors, or possibly contaminated groundwater, be subject to monitoring and personal safety equipment requirements that specifically address airborne contaminants. Workers who are in direct contact with contaminated soil or groundwater are required to perform all activities in

accordance with a site-specific health and safety plan, as outlined in the Cal/OSHA standards. The primary intent of the Title 8 requirements is to protect worker health.

Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations

The California Air Resources Board (CARB) has established the Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mining Operations to minimize the generation of asbestos from earth disturbance or construction activities (17 Cal. Code Regs. Section 93105). The Asbestos ATCM applies to any project that would include sites to be disturbed in a geographic ultramafic rock unit area, or an area where naturally occurring asbestos (NOA), serpentine, or ultramafic rocks are determined to be present. Under the ATCM, prior to any grading activities at a development site, a geologic analysis is required to determine if serpentine rock is present. If NOA is found at a development site, preparation of an Asbestos Health and Safety Program and an Asbestos Dust Mitigation Plan are required. These plans require approval by the Bay Area Air District before construction begins.

Cortese List Government Code Section 65962.5

California Government Code Section 65962.5 requires the California Environmental Protection Agency (CalEPA) to develop, at least annually, an updated Cortese List (CalEPA 2024). The California DTSC is responsible for a portion of the information contained in the Cortese List. Other state and local government agencies, including the SWRCB and the California Integrated Waste Management Board, are required to provide additional hazardous material release information for the Cortese List.

California Environmental Protection Agency

CalEPA is responsible for creating and enforcing environmental regulations within California. The DTSC is housed within CalEPA and was formed under the Hazardous Waste Control Act. The DTSC is responsible for regulating hazardous waste, remediating existing contamination, and identifying ways to reduce production of hazardous wastes. The DTSC can delegate enforcement responsibilities to local jurisdictions.

California Environmental Protection Agency Unified Program

CalEPA oversees California's Unified Program which protects Californians from hazardous waste and hazardous materials by ensuring that local regulatory agencies apply statewide standards when permits are issued and conduct inspections and enforcement activities. Specifically, the Unified Program consolidates the administration, permit, inspection, and enforcement activities of the following environmental and emergency management programs: Aboveground Petroleum Storage Act (APSA) Program, Area Plans for Hazardous Materials Emergencies, California Accidental Release Prevention (CalARP) Program, Hazardous Materials Business Plan (HMBP) Program, Hazardous Material Management Plan (HMMP) and Hazardous Material Inventory Statements (HMIS), Hazardous Waste Generator and Onsite Hazardous Waste Treatment (tiered permitting) Programs, and Underground Storage Tank Program.

Motor Vehicle Code

In addition to the RCRA hazardous waste transportation standards, California regulates the transportation of hazardous waste originating or passing through the state. State regulations are contained in the Cal. Code Regs., Title 13, Vehicle Code. Hazardous waste must be regularly removed from generating sites by licensed hazardous waste transporters. Transported materials must be accompanied by hazardous waste manifests. The CHP and the California Department of Transportation (Caltrans) are responsible for enforcing federal and state regulations pertaining to the transport of hazardous materials through California. The CHP enforces materials and hazardous waste labeling and packaging regulations that prevent leakage and spills of material in transit and provides information to cleanup crews in the event of an incident. Vehicle and equipment inspection, shipment preparation, container identification, and shipping documentation are all part of the responsibility of the CHP. The CHP conducts regular inspections of licensed transporters to assure regulatory compliance. The CHP and Caltrans also respond to hazardous materials transportation emergencies. Caltrans has emergency chemical spill identification teams at locations throughout the state.

California Valley Fever Regulations

Regulations covering Valley Fever are promulgated in Cal. Code Regs., Title 8 Regulations, in the sections summarized below.

- Section 3203, Injury and Illness Prevention: This section requires employers to establish and implement a written Injury and Illness Prevention Program (IIPP) that shall identify the person or persons with authority and responsibility for implementing the IIPP, establish a system for ensuring that employees are trained to recognize and comply with safe and healthy work practices, and establish a system for communicating with employees in a form readily understandable by all affected employees on matters relating to occupational safety and health.
- Section 5141, Control of Harmful Exposures: This section requires that harmful exposures shall be prevented by engineering controls whenever feasible. Whenever engineering controls are not feasible or do not achieve full compliance, administrative controls shall be implemented if practicable. Control by respiratory protective equipment shall be used to prevent harmful exposures (1) during the time period necessary to install or implement feasible engineering controls, and (2) where feasible engineering controls and administrative controls fail to achieve full compliance; and (3) in emergencies.
- Section 5144, Respiratory Protection: This section establishes the permissible practice for the use of respiratory protection: "(1) In the control of those occupational diseases caused by breathing air contaminated with harmful dusts, fogs, fumes, mists, gases, smokes, sprays, or vapors, the primary objective shall be to prevent atmospheric contamination. This shall be accomplished as far as feasible by accepted engineering control measures. When effective engineering controls are not feasible, or while they are being instituted, appropriate respirators shall be used pursuant to this section. (2) Respirators shall be provided by the employer when such equipment is necessary to protect the health of the employee."

San Francisco Bay Regional Water Quality Control Board

In 2000, the San Francisco Bay RWQCB first published human health risk-based screening levels (RSLs) for over 100 commonly detected contaminants at sites with impacted soil and groundwater. The RSLs were revised in 2003 to become environmental screening levels (ESLs) and their scope broadened to include direct exposure screening levels for construction and trench workers and ecological risk and nuisance/gross contamination concerns (SWRCB 2024a). The ESLs are conservative risk-based screening levels initially informed by USEPA Region 9 Preliminary Remediation Goals and CalEPA California Human Health Screening Levels. Although initially developed to regulate water quality for the San Francisco Bay Basin Water Quality Control Plan, the conservative, risk-based ESLs have been adopted by many California regulatory agencies as default screening levels to evaluate risk to human health and the environment.

Healthy School Act of 2000 (California Education Code, Sections 17608-17613)

The Healthy School Act of 2000 restricts the use of certain pesticides at school sites and requires noticing for application of approved pesticides at schools. Under Section 17610 of the California Education Code, the use of a pesticide on a school site is prohibited if that pesticide is granted a conditional registration, an interim registration, or an experimental use permit by CDPR, or if the pesticide is subject to an experimental registration issued by USEPA, and (a) the pesticide contains a new active ingredient or (b) the pesticide is for new use. The use of a pesticide on a school site is prohibited if CDPR cancels or suspends registration, or requires phase-out of use, of that pesticide.

Under Section 17611 of the California Education Code, each school site must keep records of all pesticide use at the school site for a period of 4 years and make such information available to the public. Under Section 17612, the school designee must annually provide to all staff and parents/guardians of pupils written notification of the names of all pesticide products (as well as product active ingredients) that are expected to be applied at the school site in the upcoming year. The school designee must post a warning sign in each area of the school site where pesticides are to be applied, displaying the pesticide product's name, manufacturer's name, USEPA's product registration number, intended date and areas of application, and reason for the pesticide applications.

Regional and Local Plans, Policies, Regulations, and Laws

Bay Area Air District

As described in Section 3.3, "Air Quality," the Bay Area Air District regulates air quality in the San Francisco Bay Area Basin (SFBAAB), including the County. Thus, projects located within the SFBAAB are subject to Bay Area Air District's rules and regulations. Specific rules applicable to the Program Renewal includes the Bay Area Air District administration of 17 Cal. Code Regs. Section 93105: Asbestos ATCM for Construction, Grading, Quarrying and

Surface Mining Operations. According to the Bay Area Air District Asbestos ATCM Regulatory Advisory (BAAQMD[1] 2002):

> The ATCM applies to road construction and maintenance, construction and grading operations, and quarries and surface mines when the activity occurs in an area where naturally-occurring asbestos is likely to be found. Areas are subject to the regulation if they are identified on maps published by the Department of Conservation as ultramafic rock units or if the Bay Area Air District or owner/operator has knowledge of the presence of ultramafic rock, serpentine, or naturally-occurring asbestos on the site. The ATCM also applies if ultramafic rock, serpentine, or asbestos is discovered during any operation or activity.

If the ATCM is found to apply, then (BAAQMD 2002):

> Construction projects that will disturb one acre or less are required to implement several actions to minimize the emission of dust such as vehicle speed limitations, application of water prior to and during the ground disturbance, keeping storage piles wet and covered, and track-out prevention and removal. Activities must not result in emissions that are visible crossing the property line.

Exemptions may be granted (BAAQMD 2002):

(1) if a geological evaluation demonstrates that ultramafic rock or serpentine is not likely to be found;

(2) for road construction and maintenance activities in a remote location; or

(3) for the processing of rock from an alluvial deposit.

3.8.3 Environmental Setting

This section presents an overview of hazards in the Program Renewal Area, including: (1) the potential types and locations of existing hazardous materials sites in the County; (2) emergency response, transportation and evacuation routes, and related considerations for routing of Program Renewal vehicles; (3) other types of hazards that could affect or be affected by the Program Renewal, such as herbicide use, mosquito infestation, naturally occurring asbestos, and Valley Fever; and (4) nearby school facilities and airports and airstrips that may be affected by Program Renewal activities.

Existing Hazardous Materials Sites

Numerous hazardous materials are found throughout Santa Clara County. Hazardous materials may be generated from business and industrial industries, including automotive and transportation industries, which store and use petroleum fuels, chlorinated solvents, and paints for repairs; manufacturing industries that use solvents, paints, metals, compressed gases, and cleaning agents; and the agricultural industry, which uses pesticides and

[1] The Bay Area Air District was formerly named the Bay Area Air Quality Management District (BAAQMD); the rebranding occurred in 2025. The Bay Area Air District documents that were prepared prior to 2025 and referenced in this EIR will be cited as BAAQMD.

fertilizers. Hazardous materials may be found in soil and groundwater in areas associated with these past land uses.

A database search was conducted of all data sources in the "Cortese List" (enumerated in Government Code Section 65962.5). These sources include the GeoTracker database, a groundwater information management system that is maintained by SWRCB; the EnviroStor database or the Hazardous Waste and Substances Site List maintained by the DTSC; and the USEPA Superfund Site database (SWRCB 2024b, DTSC 2024a, USEPA 2024c). According to the GeoTracker database, 3,660 known sites located in Santa Clara County have been contaminated with hazardous waste. Of these, 3,062 sites have been remediated and are considered closed; 502 sites are still open (i.e., active) (SWRCB 2024b). Within 1,500 feet of a Program Renewal channel, three sites are still active (refer to **Table 3.8-1**). According to the EnviroStor database, 967 known sites located in Santa Clara County have been contaminated with hazardous waste. Of these, 159 sites have been remediated and are considered closed and 48 remain open (DTSC 2024). Within 1,500 feet of a Program Renewal channel, 45 sites are still considered active (refer to Table 3.8-1). According to the EPA Superfund database, there are 23 superfund sites located in Santa Clara County. Of these, 10 have been cleaned up and 13 sites are still undergoing cleanup (USEPA 2024c). As shown in Table 3.8-1, a total of 563 hazardous materials sites are active within Santa Clara County. **Figure 3.8-1** shows the location of documented open hazardous materials clean-up sites within 1,500 feet of a channel that could need maintenance under the Program Renewal. Remediated sites could contribute to legacy sources of contamination at Program Renewal maintenance reaches; similarly, active sites have the potential to result in active sources of contamination at maintenance locations.

Underground storage tanks are common throughout the County. They are most often used for the storage of gasoline and diesel fuels, while also used for the storage of new and used motor oil, solvents, and chemicals. Leaking underground fuel tanks (LUFTs), mainly those containing petroleum, are the leading cause of soil and groundwater contamination in the County. LUFTs primarily occur in the urbanized areas of the County. Contaminated sites are tracked in SWRCB's GeoTracker database. According to the GeoTracker database, 44 open LUFT sites are in Santa Clara County (SWRCB 2024b). A total of 2,598 closed or remediated LUFT sites exist in Santa Clara County (SWRCB 2024b). LUFTs have the potential to cause contamination at Program Renewal maintenance locations.

In addition, portions of the Guadalupe River watershed within the Program Renewal Area are affected by historic mercury mining activities. Soil and groundwater in some areas of this watershed contain hazardous levels of mercury contamination (SWRCB 2024c). Refer to Section 3.14, "Water Quality," for more information on mercury concentrations and management actions in the Guadalupe River watershed.

Table 3.8-1. Active Hazardous Materials Sites within 1,500 Feet of Program Renewal Channels

Project Name	Address	City	Past Land Uses and Contamination
Moldaw Residences	899 East Charleston Road	Palo Alto	None specified
Moyer Chemical	1300,1310, 1336 Old Bayshore Highway	San Jose	Manufacturing, pesticides
Cupertino Village Cleaners	10989 North Wolfe Road	Cupertino	Dry cleaning
Chestnut Street	725 Chestnut Street	San Jose	Distributor, vehicle maintenance, transportation warehousing
Watson Park	Jackson Street	San Jose	Landfill
1601 S. California Avenue	1601 California Avenue	Palo Alto	Manufacturing, metal plating
Delia's Cleaners	7335 Bolinger Road	Cupertino	Dry cleaning
AJ Commercial Laundry/All Chem Supply	1173-1175 Campbell Avenue	San Jose	Laundry services
Vista Montana Park	4145 N. 1st Street	San Jose	Agricultural orchard, pesticides
South Bay Asbestos Area	Liberty Street and Guadalupe River	San Jose	Landfill
FMC	1125 Coleman Avenue	San Jose	Degreasing facility, vehicle storage and refueling, hazardous waste storage, manufacturing
Hammon Plating Corporation	890 Commercial Street	Palo Alto	Metal plating
Mora Drive	2221-2291 Mora Drive	Mountain View	Manufacturing
Lorentz Barrel and Drum Company	1507 South 10th Street	San Jose	Recycling
Former Serra Silicon Valley Corporation	1875 Dobbin Drive	San Jose	Manufacturing, metal plating
Pinehurst Community Garden	Between Lynn Avenue, Blossom Valley Drive, and Pinehurst Avenue	Los Gatos	None specified
Agnews East	3500 Zanker Road	San Jose	Aboveground storage tanks, underground storage tanks, agriculture, vehicle maintenance
The Montecito Vista Project	2745 Monterey Road	San Jose	Junkyard
Fluff Dry Cleaning	801-819 West El Camino Real	Mountain View	Dry cleaning
Swiss Cleaners	14540 Camden Avenue	San Jose	Dry cleaning

Project Name	Address	City	Past Land Uses and Contamination
Palo Alto Town & Country Village	855 El Camino Real	Palo Alto	Dry cleaning
Skylark San Jose	2482 Almaden Road	San Jose	Dry cleaning
Former Frito Lay Facility	650 North King Road	San Jose	Agriculture, manufacturing
954 Villa Street	954 Villa Street	Mountain View	Dry cleaning
HC 1849 Fortune LLC	1849 Fortune Drive	San Jose	None specified
Du-All Anodizing Corporation	730 Chestnut Street	San Jose	None specified
Italix Company, Inc.	120 Mast Street	Morgan Hill	None specified
Clearwater Environmental Management, Alviso Independent Oil	5002 Archer Street	Alviso	Hazardous waste storage
New Laurelwood Elementary School	1095 & 1055 Dunford Way, 1380 Rosalia Avenue	Sunnyvale	None specified
Ultra Chem/Scott Enterprises	1310 Old Bayshore Boulevard	San Jose	Distribution, manufacturing, pesticides, vehicle maintenance, industrial waste treatment facility
Target Masters West	122 Minnis Circle	Milpitas	Firing range
Compugraphics USA, Inc.	821 San Antonio Road	Palo Alto	None specified
2330 Monroe Street Affordable Housing Project	2330 Monroe Street	Santa Clara	Agriculture, orchard, and row crops
STION Corporation	6321 San Ignacio Avenue	San Jose	None specified
Los Altos High School Expansion	201 Almond Avenue	Los Altos	Agriculture, underground storage tanks
Safety Kleen San Jose	1147 Tenth Street	San Jose	Hazardous waste storage
Mountain View High School Expansion	3535 Truman Avenue and 1305 Bryant Avenue	Mountain View	Agriculture, orchard
Proposed San Antonio Elementary School	435 San Antonio Road; 2535 California Street; 350, 506, 510-520 Showers Drive	Mountain View	Agriculture, orchard, retail
Westwood Elementary School	435 Saratoga Avenue	Santa Clara	None specified
Communications Hill New School	Corner of Lina Street and Communications Hill Boulevard	San Jose	Mine

Project Name	Address	City	Past Land Uses and Contamination
Saving Cleaners	1641 McKee Road	San Jose	Dry cleaning
Baypointe Redevelopment	210 Baypointe Parkway	San Jose	Agricultural orchard and row crops
Briarwood Elementary School	1930 Townsend Avenue	Santa Clara	None specified
Las Golondrinas	77 Kentucky Place	San Jose	Unknown
Former PARC 3333 Coyote Hill Road	3333 Coyote Hill Road	Palo Alto	Laboratories, research
San Jose/ Santa Clara Water Pollution Control Plant*	700 Los Esteros Road	San Jose	Diesel
Sunnyvale Water Pollution Control Plant*	1444 Borregas Avenue	Sunnyvale	None specified
Palto Alto Water Quality Control Plant*	2501 Embarcadero Way	Palo Alto	None specified

Emergency Response, Evacuation, and Transportation Routes

Hazardous materials emergency response is the responsibility of the Santa Clara County Department of Environmental Health (DEH), which is the Certified Unified Program Agency (CUPA) for all areas in the County except the cities of Santa Clara, Gilroy, and Sunnyvale, which have their own CUPA that provides emergency response. Additionally, the Santa Clara County Fire Department, Mountain View Fire Department, and Palo Alto Fire Department assist and coordinate their activities with the Santa Clara County DEH (Unidocs 2018). These hazardous materials response teams are trained to respond to any level of hazardous materials incident in the County, including overturned tank trucks, fires involving hazardous materials and chemicals, incidents involving radioactive materials, downed electrical lines and ruptured natural gas lines, chlorine and toxic gas releases, fuel spills, and explosives and bombs. Valley Water coordinates with emergency response providers, as needed, during its routine maintenance activities. Furthermore, Valley Water has its own hazardous materials (HAZMAT) team that responds to numerous types of hazardous materials spills 24 hours a day, 7 days a week and will respond within two hours of the report (Valley Water 2024).

Although evacuation routes are not specifically identified in the Santa Clara County General Plan (1994), the Multijurisdictional Hazard Mitigation Plan (MJHMP) and the Safety Element of the General Plan are being updated concurrently and these updates will include an evacuation assessment (County of Santa Clara 2024). Additionally, the current MJHMP and Safety and Noise General Plan element establish policies and procedures to ensure the effective management of emergency operations and preparedness within Santa Clara County. In general, major arterials would serve as evacuation routes through the County and major highways providing regional access, such as U.S. 101, I-280, and SR-17, also would be used in the event of a large-scale evacuation.

Similarly, Valley Water transports its hazardous wastes through the County by truck, primarily along major arterials and highways, for disposal at treatment, storage, and disposal facilities in the County or other counties. County roads and city streets may be used to transport hazardous wastes from their sources to major highways. Haulers are required to use the most direct, safe route. The County of Santa Clara Emergency Operations Plan (EOP) identifies U.S. 101, I-880, I-680, and I-280 as the four major highways in the County that carry large quantities of hazardous materials. U.S. 101 and I-880 have the most truck traffic and are the most frequent location of hazardous materials spills (County of Santa Clara 2022).

Hazardous Waste Disposal Sites

Although Santa Clara County has some hazardous waste facilities that collect household hazardous waste, there are no certified hazardous waste disposal facilities located in the County. Thus, hazardous waste is disposed at hazardous waste facilities located outside of the County. Two hazardous waste disposal sites are located in California: the Kettleman Hills facility; and the Buttonwillow Landfill facility. The Kettleman Hills facility is located halfway between San Francisco and Los Angeles in Kings County and has a capacity of approximately 10.7 million cubic yards; however, it is only able to accept very small quantities of hazardous waste because it has nearly reached capacity. The landfill is currently seeking permits to continue to conduct hazardous waste landfill operations (DTSC 2024b; Waste Management, N.D.). The Buttonwillow Landfill facility, located west of Bakersfield, is a fully permitted hazardous waste facility that is permitted to receive, store, and treat a variety of hazardous and non-hazardous waste streams (Clean Harbors 2024). The permitted capacity of the

Buttonwillow landfill facility is 13,325,000 cubic yards and is estimated to reach capacity in 2040 (Clean Harbors 2024).

Both Kettleman Hills and Buttonwillow Landfill facilities are capable of treating, storing, and/or disposing solid, semi-solid, and liquid hazardous, extremely hazardous, and non-hazardous wastes (Waste Management 2024; Clean Harbors 2024).

Herbicide Use by Valley Water

One method Valley Water has used during implementation of the existing Stream Maintenance Program (SMP) to control vegetation along maintained channels has been the application of herbicides. Valley Water applies herbicides in accordance with the existing SMP Manual, and with federal and state regulations and permits. During 2014-2023, herbicides were applied to various creeks, channels, and other waterbodies throughout the County which are summarized in **Table 3.8-2**.

Table 3.8-2. 2014-2023 Herbicide Use Locations

Type of Waterbody	Name of Waterbody
River	Guadalupe River
Creek	Adobe, Alamitos, Barron, Berryessa, Calabazas, Calera, Calero, Canoas, Corrallitos, Coyote, Daves, Deer, East Little Llagas, Fisher, Flint, Golf, Greystone, Guadalupe, Hale, Heney, Lions, Llagas, Lone Hill, Los Coches, Los Gatos, Lower Penitencia, Lower Silver, Matadero, Miguelita, Mistletoe, North Babb, Norwood, Penitencia, Permanente, Piedmont, Prospect, Quimby, Randol, Regnart, Rodeo, Ross, Ruby, San Francisquito, San Tomas Aquino, Saratoga, Sierra, Smith, South Babb Stevens, Summerhill, Thompson, Tennant, Tularcitos, Upper Penitencia, Upper Silver, Uvas, West Branch Llagas, and West Little Llagas Creeks
Channel	Cochran, Junipero Serra, North Morey, Penitencia East, Permanente Diversion, South Morey, Stanford, Sunnyvale East, and Sunnyvale West Channels
Slough	Upper Miller Slough
Drain/Storm Drain	Princevalle Drain, El Camino Storm Drain

Table 3.8-3 summarizes the herbicides that would be applied under Program Renewal as well as the usage type, application frequency and method, and projected annual application amounts. Valley Water uses Category III and IV herbicides, which are the least toxic chemical herbicides designated by USEPA, with the exception of triclopyr-choline and paraffinic oil, which are Category II. In addition, all pesticide applicators are required to be licensed by the California Department of Pesticide Regulation or work under the supervision of someone who is licensed in accordance with Valley Water's Pesticide Policy.

Table 3.8-3. Summary of Herbicide and Adjuvant Types Proposed for Use under Program Renewal

Typical Application Location	Active Ingredient	Usage Type	Projected Annual Use	Application Frequency and Method
Upland Vegetation Upper maintenance roads and inboard or outboard levee slopes	Glyphosate	Post-emergent, cut-stump	600 gal/yr	1-2 times/year; target specific vegetation, spot spray, or cut-stump
	Triclopyr	Post-emergent, cut-stump	6 gal/yr	
	Aminopyralid + triclopyr	Post-emergent	300 gal/yr	
	Clopyralid	Post-emergent	4 gal/yr	
	Isoxaben	Pre-emergent	500 lb/yr	1 time/year; broadcast application to bare ground
	Dithiopyr	Pre-emergent	600 lb/yr	
	Aminopyralid	Pre-emergent and post-emergent	200 gal/yr	1-2 times/year; broadcast application for pre-emergent use; target specific vegetation or spot spray for post-emergent use
	Aminopyralid + Florpyrauxifen-benzyl	Post-emergent	200 gal/yr	1-2 times/year; target specific vegetation or spot spray
	Ethyl oleate	Non-ionic surfactant	100 gal/yr	Surfactant may be used in conjunction with application of other active ingredients
Aquatic Vegetation In channel, lower maintenance roads, access ramps, and terrace areas	Glyphosate	Post-emergent, cut-stump	500 gal/yr	1 time/ year; target specific vegetation/spot spray
	Imazapyr	Post-emergent	232 gal/yr	
	Imazamox	Post-emergent	100 gal/yr	
	Triclopyr-choline	Post-emergent	100 gal/yr	
	Ethyl oleate	Non-ionic surfactant	210 gal/yr	
	Paraffinic oil	Non-ionic surfactant	100 gal/yr	

Note: gal/yr = gallons per year

Mosquito Abatement

The Santa Clara County Vector Control District (SCCVCD) manages vector control in Santa Clara County. The SCCVCD manages vectors such as rats, mosquitoes, ticks, and fleas, to

control the spread of vector-borne diseases including malaria, West Nile virus, Lyme disease, and rabies (SCCVCD 2024a). The SCCVCD uses a variety of methods to control vectors, including stocking ponded areas with mosquito fish and screening irrigation drains.

Under the California Health and Safety Code, mosquito abatement districts are empowered to take all necessary and proper steps for the elimination and extermination of mosquitoes. SCCVCD routinely inspects potential mosquito breeding locations. If mosquito production is found, they take action to control or eliminate the problem (SCCVCD 2024b).

Naturally Occurring Asbestos

Asbestos is a naturally occurring fibrous mineral found in many parts of California, including Santa Clara County. When rocks containing these fibrous minerals are broken apart, asbestos fibers can become airborne and present a potential human health risk. Natural occurrences of asbestos are more likely to be encountered in, and immediately adjacent to, areas of ultramafic rocks. Outcrops of ultramafic rock are present in Santa Clara County (U.S. Geological Survey 2011). As shown in Figure 3.8-1, ultramafic rock is present adjacent to many Program Renewal channels in the Coyote, Guadalupe, and Pajaro watersheds.

Valley Fever

Valley Fever, sometimes called "San Joaquin Valley fever" or "desert rheumatism," is an infection caused by soil dwelling fungus (Coccidioides) that, when inhaled can affect the lungs, causing respiratory symptoms including cough, fever, chest pain, and tiredness. Valley Fever can be contracted from being exposed to ground disturbing activities and may be common in soil types throughout the Program Renewal Area. Although there are no commercially available tests to detect this fungus in soil, Valley Fever cases have been reported in the County since 2001 and have increased tenfold over the past 23 years. In 2024, Santa Clara County reported 107 cases, an increase from the 12 cases reported in 2001 (California Department of Public Health 2024). As climate conditions continue to change with more persistent drought conditions and changes in precipitation patterns, it is anticipated that Valley Fever cases will continue to increase.

School Facilities

In Santa Clara County, 34 school districts and 405 schools provide educational services to over 246,450 students (ED Data 2023). Program activities may occur in close proximity to schools. A total of 222 schools are located within 0.25 mile of Program Renewal channels (refer to **Table 3.8-4**).

Airports and Airstrips

Airports in Santa Clara County include San Jose Mineta International Airport, Reid-Hillview County Airport, San Martin Airport, Moffett Federal Airfield, and the Palo Alto Airport. These airports are shown in Figure 3.8-1. Some Program Renewal channels are located within airport safety zones defined in the Airport Comprehensive Land Use Plan. For example, the Guadalupe River is located within the San Jose Mineta International Airport safety zone.

3.8.4 Impact Analysis

Methodology

The analysis used a qualitative approach to assess the potential for the Program Renewal activities to result in adverse impacts to the public or environment during or after their implementation related to hazards and hazardous materials. The impact analysis baseline is the existing conditions at the time of the May 2022 Notice of Preparation and evaluates impacts from the maintenance activities implemented for the existing Program (SMP-2) and the new activities proposed for the Program Renewal. The assessment and significant determinations were guided by the significance criteria provided in the California Environmental Quality Act (CEQA) Guidelines, which are provided below. The analysis considered the implementation of applicable Best Management Practices (BMPs) and adherence to existing laws and regulations. Where feasible, mitigation measures were identified to reduce significant impacts.

Criteria for Determining Significance

Based on Appendix G of the CEQA Guidelines, the Program Renewal would result in a significant impact on hazards or hazardous materials if it would:

A. create a significant hazard to the public or environment through the routine transport, use, or disposal of hazardous materials;
B. create a significant hazard to the public or environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
C. emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
D. be located on a site that is included on a list of hazardous materials sites compiled pursuant to California Government Code Section 65962.5, and as a result, create a significant hazard to the public or the environment;
E. result in a safety hazard or excessive noise for people residing or working in the project area if the project is within the jurisdiction of an airport land use plan or, where such a plan has not been adopted within two miles of a public airport or public-use airport or private airstrip;
F. impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; or
G. expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

For purposes of the analysis included below, Appendix G CEQA significance criteria (a) and CEQA significance criteria (b) were combined into one discussion to better fit the Program Renewal.

Appendix G of the CEQA Guidelines suggests that a project may result in significant impacts if it creates a safety hazard or excessive noise for people residing or working in the project area if the project is located within the jurisdiction of an airport land use plan or within two miles of a public airport or private airstrip. Although Program Renewal activities may be

performed within two miles of an airport, these activities would not interfere with airport operations, would not involve the use of any equipment that would affect aircraft utilizing any airports in the Program Renewal Area, and would not result in a substantial safety hazard or excessive noise for people residing or working in vicinity of airports. For these reasons, this issue is not discussed further in this Draft Subsequent Environmental Impact Report (DSEIR).

Appendix G of the CEQA Guidelines suggests that projects may have a significant effect on hazardous and hazardous materials if they would expose people or structures to a significant risk of loss, injury, or death involving wildland fires (criterion g). The Program Renewal's potential for exposing people or structures to wildland fires is analyzed in Section 3.15, "Wildfire."

The Program Renewal's maintenance activities would not create standing water that would foster mosquitoes, nor would it interfere with abatement efforts conducted by the Valley Water, so this issue is not discussed further.

Environmental Impacts

Impact HAZ-1: Create a Significant Hazard to the Public or Environment through the Routine Use, Transport, Disposal, or Accidental Release of Hazardous Materials (Less than Significant with Mitigation)

Program Renewal activities would involve the routine transport, use, and disposal of hazardous materials such as herbicides, fuel, oil, solvents, and related materials. These materials would be primarily found within maintenance equipment but may also be stored onsite at designated staging areas for refueling or maintaining equipment or transported as necessary to work areas. Although maintenance activities would be temporary in any one location, and generally confined to a small area surrounding channels, maintenance activities would be in or near public areas where residents or recreational users could be exposed to hazardous materials and/or channels that could sequester or transport chemicals in the water and sediment. Therefore, routine transport, use, and disposal of hazardous materials could potentially create a hazard to the public or to the environment.

Additionally, hazardous materials could be potentially released to the environment through upset or accident conditions if adequate precautions are not taken. Such a release could harm aquatic or terrestrial organisms and pose a hazard to construction workers and/or the public. Additional details regarding the transport, use, disposal, and accidental release of hazardous materials for the Program Renewal activities are provided below.

Vegetation Management

Maintenance activities under the Program Renewal would involve the handling and application of herbicides. Specifically, the Program Renewal's vegetation management activities would include the transport of herbicides to the work site, use of herbicides to control vegetation within the channel and along the bank and upland areas, and the disposal of herbicide containers or applicator equipment after completing the work. Valley Water currently uses Category III and IV herbicides (with the exception of triclopyr-choline and paraffinic oil, which are Category II). Category III and IV herbicides are the least toxic

chemical herbicides designated by USEPA (refer to Table 3.8-3 above for the specific herbicides that could be used under the Program Renewal and the projected annual usage amounts) and continually works to minimize herbicide use as much as is practical, as described in the SMP Manual (**Appendix A**). Application of herbicides would comply with all herbicide label instructions and all relevant permits including the Statewide General NPDES permit for aquatic pesticide use. Valley Water also complies with its APAP, a comprehensive plan that describes projects, practices to reduce water quality impacts, and monitoring requirements. In addition, Valley Water's Pesticide Policy requires applicators of all pesticides to be licensed by the California Department of Pesticide Regulation or work under the supervision of someone who is licensed.

Additionally, as hazardous materials, herbicides would be subject to BMPs regarding the management of hazardous materials during Program Renewal activities, which would minimize effects associated with the transport, use, and disposal of herbicides during maintenance work. Implementation of BMPs would also help to minimize any potential for accidental releases of herbicides during application.

Vegetation management activities would require the use of fuels and lubricants for maintenance equipment. The use, transport, disposal, or accidental spills of these hazardous materials could adversely affect people or wildlife if the pollutants were released into the water or the ground. However, Program Renewal activities would be conducted in compliance with federal, state, and local regulations, including OSHA and Cal/OSHA requirements that include safety procedures for the handling of hazardous materials which would reduce the potential for a significant hazard to the public or environment. BMPs listed below would also reduce the potential for a significant hazard to the public or environment by implementing hazardous materials management and response measures.

Management of Animal Conflicts

Animal conflict management activities conducted under the Program Renewal would include integrated pest management, physical alterations such as surface compaction of levee faces or filling burrows, bird nest deterrence, bat inspection and exclusion, habitat modification through vegetation management, live (nonlethal) trapping, chemical repellents (e.g., plant extracts), and fumigation. Fumigants, including gas cartridges and aluminum phosphide, are only used when other animal control methods are inadequate to feasibly address a conflict. Fumigants would not be used within the habitat areas of special-status species amphibians. To prevent potential hazardous impacts associated with fumigation, fumigant application would follow all label use restrictions. Additionally, no rodenticides would be used under Program Renewal.

Additionally, management of animal conflicts would require the use of fuels and lubricants for maintenance equipment. Program Renewal activities would be conducted in compliance with federal, state, and local regulations including OSHA and Cal/OSHA requirements that include safety procedures for the handling of hazardous materials which would reduce the potential for a significant hazard to the public or environment. BMPs listed below would also reduce the potential for a significant hazard to the public or environment by implementing hazardous materials management and response measures.

Within the Program Renewal Area, NOA is known to be present adjacent to Program Renewal Area channels where maintenance activities may occur within the Guadalupe, Coyote, and

Pajaro watersheds (refer to Figure 3.8-1). Although there is no health threat if asbestos fibers in soil and rocks remain undisturbed and do not become airborne, ground disturbing activities such as management of animal conflicts could release NOA into the air and may expose the public, including maintenance workers to airborne asbestos. The Program Renewal would comply with Bay Area Air District's ATCM for Construction, which requires the implementation of measures to minimize dust emissions and would also implement BMP GEN-36 (Dust Management) which requires the implementation of dust control measures (e.g., watering disturbed surfaces, covering materials in haul trucks) to minimize potential impacts. However, a significant impact may still occur to the public when ground-disturbing activities occur in areas that contain NOA. Implementation of **Mitigation Measure HAZ-1** requires the implementation of dust control measures when conducting ground-disturbing activities using mechanized heavy equipment in areas containing NOA to reduce the potential for the hazards to become airborne. Through the implementation of **Mitigation Measure HAZ-1,** impacts related to hazards to the public and the environment through NOA would be less than significant with mitigation.

Other Maintenance

Other maintenance activities including sediment removal, bank stabilization, downed tree management, and minor maintenance activities would use heavy equipment that would require fuel, oil, lubricants, and other potentially hazardous materials. These hazardous materials would be transported to and from maintenance sites and would be removed once projects were completed. If hazardous materials were released into the water or the ground during equipment refueling or maintenance activities, contamination and harm to people or wildlife could result. However, similar to what was described above, Program Renewal activities would be conducted in compliance with federal, state, and local regulations including OSHA and Cal/OSHA requirements that include safety procedures for the handling of hazardous materials which would reduce the potential for a significant hazard to the public or environment. BMPs listed below would also reduce the potential for a significant hazard to the public or environment by implementing hazardous materials management and response measures.

Ground-disturbing activities such as sediment removal, bank stabilization, and minor maintenance activities could potentially disturb contaminated sediments that may be present in channels or the work area. Mobilization/transport of contaminated sediments or soils associated with the Program Renewal could potentially create a hazard to the public and the environment. Additionally, improper handling and disposal of contaminated sediments, including improper stockpiling of sediment, could also create a hazard to the public and the environment. As described in Section 3.14, "Water Quality," Valley Water would adhere to its Sediment Characterization Plan that requires sediment testing to determine if soil is contaminated, which would minimize impacts associated with soil disturbance. Additionally, handling and disposal of any contaminated sediment encountered/removed as part of Program activities would be subject to applicable laws and regulations governing hazardous materials, including Cal/OSHA regulations which require all activities to be performed in accordance with a site-specific health and safety plan to protect worker and public health. Compliance with these existing requirements, as well as implementation of BMPs listed below would minimize the potential for a significant hazard to the public or the environment by implementing hazardous materials management and disposal measures.

As described above, ground disturbing activities such as bank stabilization and sediment removal could release NOA into the air and may expose the public, including maintenance workers to airborne asbestos which would be a significant impact. The Program Renewal would comply with Bay Area Air District's ATCM for Construction, which requires the implementation of measures to minimize dust emissions and would implement BMP GEN-36 (Dust Management) which requires the implementation of dust control measures (e.g., watering disturbed surfaces, covering materials in haul trucks) to minimize potential impacts. However, a significant impact may still occur to the public when ground-disturbing activities occur in areas that contain NOA. Implementation of **Mitigation Measure HAZ-1** requires the implementation of dust control measures when conducting ground-disturbing activities using mechanized heavy equipment in areas containing NOA to reduce the potential for the hazards to become airborne. Through the implementation of **Mitigation Measure HAZ-1**, impacts related to hazards to the public and the environment through NOA would be less than significant with mitigation.

Applicable Best Management Practices

The BMPs summarized below would be implemented to reduce potential impacts associated with the use, transport, disposal, or accidental release of hazardous materials as a result of Program Renewal. A full description of each BMP is provided in Chapter 2, *Project Description*.

- **BMP GEN-2: Instream Herbicide Application** establishes protection measures for the use of instream herbicides and prohibits the use of herbicides in certain conditions to reduce potential impacts associated with herbicide use.
- **BMP GEN-24: Work Site Housekeeping** requires the work site to be maintained in a neat and orderly condition, including storing materials and equipment to avoid leaks or other potential impacts associated with hazardous materials.
- **BMP GEN-26: Staging and Stockpiling of Materials** establishes requirements for staging and stockpiling materials to minimize potential impacts associated with these activities, including storing materials away from areas where they could spill into waterbodies or storm drains.
- **BMP GEN-29: On-Site Hazardous Materials Management** requires the proper management of hazardous materials, including storing hazardous materials and wastes in watertight containers with appropriate secondary containment. Generators and other equipment with the potential to leak or spill hazardous materials would also be stored and operated with secondary containment to minimize potential impacts of a hazardous materials release.
- **BMP GEN-30: Existing Hazardous Materials** requires the removal and disposal of hazardous materials found at maintenance sites in accordance with applicable regulatory requirements.
- **BMP GEN-32: Painting and Paint Removal** requires Valley Water to avoid paving and seal coating in wet weather and when rain is forecasted to prevent hazardous materials from coming into contact with water.
- **BMP GEN-33: Spill Prevention and Response** includes the implementation of measures to prevent the accidental release of hazardous materials, specifies protocols for spill response and reporting, and requires that cleanup supplies are available on site.

- **BMP GEN-34: Existing Hazardous Sites** requires Valley Water to conduct a search for existing known contaminated sites during preparation of the Notice of Proposed Work (NPW). For any ground-disturbing activities within 1,500 feet of an open contamination site, Valley Water will work with the RWQCB case manager to ensure maintenance activities would not affect cleanup work or threaten the public or environment.
- **BMP GEN-35: Fire Prevention** implements measures to reduce the risk of fire from maintenance activities by equipping equipment with spark arrestors, having fire suppression available at the work site, and keeping flammable materials away from equipment.
- **BMP GEN-36: Dust Management** requires Valley Water to implement the Bay Area Air District's Basic Dust Control Measures that include watering exposed soils, covering haul trucks, limiting vehicle speeds, among others to reduce fugitive dust that may contain NOA.
- **BMP GEN-37: Vehicle and Equipment Maintenance** requires that vehicles and equipment are kept clean without excessive build-up of oil and grease, and that equipment used in creek channels be inspected for leaks each day prior to initiation of work. Equipment servicing and repairs will also be conducted outside of the channel to prevent pollutants from reaching surface waters.
- **BMP GEN-38: Vehicle Cleaning** requires that equipment be cleaned prior to transfer and use in a different watershed and vehicle and equipment washing will occur at approved wash areas in Valley Water's corporation yard.
- **BMP GEN-39: Vehicle and Equipment Fueling** prohibits fueling of vehicles and equipment in the channel or immediate floodplain and requires that designated fueling locations and secondary containment are provided to prevent the accidental release of fuel.
- **BMP ANI-2: Prevent Harm to the Salt Marsh Harvest Mouse, California Ridgway's Rail, and California Black Rail** prohibits the use of fumigants within the range of salt marsh harvest mouse, California's Ridgway's Rail, or California Black Rail identified on Program Renewal range maps.
- **BMP ANI-3: Burrowing Owl Buffer Zone** prohibits fumigant use within known burrowing owl locations.
- **BMP ANI-4: Animal Control in Sensitive Amphibian Habitat** prohibits the use of harmful rodenticides in the Program Renewal Area and prohibits the use of fumigants within habitat areas of special-status amphibians.
- **BMP HM-4: Posting and Notification for Pesticide Use** requires posting of areas where pesticides will be used.

Conclusion

Implementation of BMPs and compliance with all relevant federal, state, and local laws, regulations, and policies, including Cal/OSHA regulations regarding handling and disposal of contaminated soil, would minimize the potential for the Program Renewal to result in a significant hazard to the public or the environment from the use, transport, disposal, or accidental release of hazardous materials. Compliance with BMP GEN-36 (Dust Management) and Bay Area Air District's ATCM for Construction would reduce impacts from NOA, but not

to a less-than-significant level. Implementation of **Mitigation Measure HAZ-1** would further reduce impacts from NOA such that there would be no significant hazard to the public or the environment through reasonably foreseeable upset or accident conditions involving NOA. Therefore, the impact would be **less than significant with mitigation.**

Mitigation Measure HAZ-1: Implement Dust Control Measures in Areas Containing NOA and in the Event of High Risk of Valley Fever

Valley Water will be responsible for implementing the following dust control measures when conducting ground-disturbing activities using mechanized heavy equipment in areas containing NOA (as identified in Figure 3.8-1) consistent with the Bay Area Air District's NOA Technical Advisory Requirements (BAAQMD). When working in an area identified as containing NOA, if there are circumstances that suggest that NOA may not be present in the disturbed area (such as when working in areas that consist of fill brought in from outside the area), testing for NOA would be conducted. If testing determines that the soil does not contain significant amounts of NOA, the measures included below would not need to be implemented. However, if testing is not conducted in these areas or if testing reveals the presence of significant amounts of NOA, the following dust control measures will be implemented:

- Prior to any ground disturbance, areas to be graded or excavated shall be kept adequately wet with water to minimize visible emissions from the release of particulate matter into the air.
- Storage piles containing NOA shall be kept adequately wetted, treated with a chemical dust suppressant, or covered when material is not being added to or removed from the pile. Covers, when used, shall be physically secured and maintained throughout their use.
- As needed to prevent transportation of soil containing NOA, equipment shall be washed down after use and prior to the equipment moving from the work area onto a paved public road. Wheels shall be washed prior to moving equipment from construction areas containing NOA to areas that do not contain NOA.
- Construction vehicles shall be limited to 15 miles per hour (mph) or less on the work site. Vehicles hauling NOA-containing materials outside NOA-containing areas shall have loads wetted and/or covered such that no visible emissions are generated. Under no circumstances shall haul trucks be allowed to transport NOA-containing materials in a manner that allows visible particle emissions from either the wheels while traveling over NOA-containing materials or from the load of the truck.
- Suspension of ground-disturbing activities shall be required when wind speeds exceed 20 mph for a minimum of 30 minutes.
- Work boot wash stations shall be provided at the maintenance site.
- Vehicles that exit the site to a public paved road from an unpaved area shall utilize track-out prevention and control measures, including a gravel pad, a tire shaker, or a wheel wash system. Visible track-out from a paved public road shall be removed where vehicles exit the work site by using wet sweeping or a high-efficiency particulate air (HEPA) filter or vacuum device equipped with an equivalent particulate filter at the end of each

day.

- The Valley Water Environmental Health and Safety unit shall be consulted to determine whether modifications to these measures or additional safety measures are needed when working in an area that contains NOA.
- Valley Fever is currently relatively uncommon in Santa Clara County. In the event that Valley Fever reaches highly endemic levels in Santa Clara County, Valley Water Operations and Maintenance staff will consult with Valley Water's Environmental Health and Safety unit to establish measures that minimize the risk of Valley Fever infection. Where appropriate, these measures may incorporate measures for NOA listed above or adaptations thereof.

Impact HAZ-2: Impair Implementation of or Physically Interfere with an Adopted Emergency Response Plan or Emergency Evacuation Plan (Less than Significant)

This impact analysis discusses Program Renewal impacts on emergency response and evacuation generally and is not limited to adopted emergency response or evacuation plans. Program activities that involve the operation of heavy equipment on roadways (e.g., sediment removal, vegetation management, bank stabilization, etc.) could potentially interfere with traffic movement and impair emergency response or evacuation operations. Temporary road or lane closures, as well as traffic associated with the Program Renewal, could also potentially affect emergency response or evacuation operations. Program Renewal activities could require the use and/or temporary storage of heavy equipment, vehicles, sediments, and other materials near or on the work site which may require temporary road or lane closures. Temporary road closures may interfere with traffic movement and impair emergency response or evacuation procedures in the event of an emergency. In addition, increased traffic generated by Program Renewal activities from workers traveling to and from the work site may also interfere with emergency response and evacuation efforts (see Section 3.12, "Traffic and Transportation," for more discussion of transportation-related impacts). To the extent feasible, work would be staged and conducted to maintain two-way traffic flow on public roadways in the vicinity of work sites.

As described above, major arterials would serve as evacuation routes through the County as well as major highways (e.g., U.S. 101, I-280, I-880, and SR-17) in the event of a large-scale evacuation. Thus, these roads could be impacted if Valley Water activities required temporary lane or road closures during maintenance activities. Implementation of BMPs, described below, would reduce the potential for Program Renewal activities to impair emergency response or evacuation procedures by notifying the public of upcoming maintenance work, ensuring that emergency service providers are notified of any planned lane or road closures, implementing public safety measures to reduce impediments to traffic movement, and implementing appropriate traffic control measures in the event that temporary road or lane closures are required .

Applicable Best Management Practices

The BMPs summarized below would be implemented to minimize impacts to emergency response and emergency evacuation procedures as a result of implementation of the Program Renewal. A full description of each BMP is provided in Chapter 2, *Project Description*.

- **BMP GEN-43: Public Outreach** will ensure that the public and local governments, including emergency response providers, are informed of upcoming maintenance work to reduce potential effects to emergency response times.
- **BMP GEN-44: Implement Public Safety Measures** will ensure that work sites have proper signage and trucks will be allowed to pull into and out of work site access points during temporary lane closures to reduce traffic delays.
- **BMP GEN-46: Planning for Pedestrians, Traffic Flow, and Safety Measures** requires that temporary lane closures be coordinated with the appropriate jurisdictional agency and local emergency service provider, and appropriate traffic control measures are implemented so that emergency vehicle access and response is not impeded.

Conclusion

As stated above, implementation of BMPs would require Program Renewal-related traffic and temporary lane or road closures resulting from Program Renewal activities to be coordinated with local emergency response agencies to help maintain emergency access and evacuation routes. With the implementation of the above-listed BMPs, impacts on emergency response and evacuation, including impacts on emergency response and evacuation plans, would be **less than significant.**

Mitigation Measures: No mitigation is required.

Impact HAZ-3: Be Located on a Site Included on a List of Hazardous Materials Sites Compiled Pursuant to Government Section Code 56962.5 (Less than Significant)

According to the GeoTracker database, EnviroStor database, and USEPA Superfund database (SWRCB 2024b; DTSC 2024a; USEPA 2024c), a total of 563 sites are still active in Santa Clara County and either are being remediated or remain in need of remediation. Out of these active sites, 48 sites are located within 1,500 feet of a Program Renewal channel (refer to Table 3.8-1). As discussed previously, the locations and extent of maintenance activities change each year. The potential for the Program Renewal activities to affect known contaminated sites is discussed further below.

Sediment Removal/Bank Stabilization

Ground disturbing activities such as sediment removal and bank stabilization activities could potentially disturb known existing contaminated sites. However, the potential to disturb existing contaminated sites in the Program Renewal Area would be evaluated as part of the annual maintenance planning process under the NPW prior to conducting maintenance work. (refer to BMP GEN-34 [Existing Hazardous Sites]). If the database search determines that ground disturbing activities such as sediment removal and bank stabilization activities would occur within 1,500 feet of an open site, Valley Water will contact the case manager and work with the case manager to ensure that Program Renewal activities do not affect cleanup or monitoring activities or threaten the public or environment. Furthermore, additional BMPs would further minimize potential impacts associated with known contaminated sites by minimizing the area of disturbance and access points and ensuring proper disposal of found hazardous materials on site.

In addition, portions of the Guadalupe River watershed within the Program Renewal Area are affected by historic mercury mining activities. Soil and groundwater in some areas of this watershed contain hazardous levels of mercury contamination (SWRCB 2024c). Thus, there is a potential for sediment removal and bank stabilization activities to expose the mercury and potentially release it into the environment if proper handling methods are not implemented. Implementation of BMP GEN-3 (Avoid Exposing Soils with High Mercury Levels) would require soil testing for soils that are likely to be disturbed or excavated and if mercury levels are exceeded, this BMP requires soil remediation to be conducted.

Other Maintenance Activities

Other Program Renewal activities that involve ground disturbance, such as compacting levee surfaces under management of animal conflicts, vegetation management, and minor sediment removal activities, could have the potential to disturb existing contaminated sites. Similar to sediment removal and bank stabilization activities described above, implementation of BMPs listed below would reduce potential impacts by conducting a search of known contaminated sites prior to conducting maintenance work, testing soils in the Guadalupe River watershed for mercury and implementing appropriate remediation measures, minimizing the area of disturbance and stream access points, and ensuring proper disposal of found hazardous materials. Additionally, and similar to what was described above, Program Renewal activities would be conducted in compliance with federal, state, and local regulations including OSHA and Cal/OSHA requirements that include safety procedures for the handling of hazardous materials which would reduce the potential for a significant hazard to the public or environment.

Applicable Best Management Practices

The BMPs summarized below would be implemented to reduce potential impacts associated with Program Renewal activities occurring on a known hazardous materials site. A full description of each BMP is provided in Chapter 2, *Project Description*.

- **BMP GEN-3: Avoid Exposing Soils with High Mercury Levels** requires sediment removal and bank stabilization activities occurring in portions of the Guadalupe River watershed affected by historic mercury mining to test soil for mercury and implement remediation activities if soils exceed established mercury levels. Workers will also be required to wear personal protective equipment to maintain exposure levels below OSHA standards.
- **BMP GEN-4: Minimize the Area of Disturbance** requires soil disturbance to be minimized to the maximum extent feasible.
- **BMP GEN-28: Stream Access** establishes temporary access points close to the work area and requires the use of existing exiting ramps and roads to minimize disturbance around the work area and to channels.
- **BMP GEN-30: Existing Hazardous Materials** ensures that hazardous materials found on site are disposed of properly according to applicable regulatory requirements.
- **BMP GEN-34: Existing Hazardous Sites** requires Valley Water to conduct a search for existing known contaminated sites as part of the annual NPW prior to conducing maintenance work.

Conclusion

With the implementation of the above-listed BMPs, and compliance with applicable hazardous materials laws and regulations, ground-disturbing activities conducted under the Program Renewal would not create a significant hazard to the public or environment from known hazardous materials sites. Therefore, this impact would be **less than significant**.

Mitigation Measures: No mitigation is required.

Impact HAZ-4: Be Located on a Previously Undiscovered Contaminated Site (Less than Significant)

Channels are common locations for illegal dumping of trash containing hazardous wastes, such as tires, oil filters, and paint cans. In addition, pollutants transported in stormwater runoff can accumulate in these waterbodies. The potential for Program Renewal activities to be located on a previously undiscovered contaminated site is discussed further below.

Sediment Removal/Bank Stabilization

Ground-disturbing activities associated with bank stabilization and sediment removal activities could disturb previously unknown buried contamination including illegally dumped trash. Contaminants also are transported from streets and paved urban areas through storm drains and into channels. Areas surrounding storm drain culvert outfalls can accumulate urban contaminants, such as heavy metals and petroleum byproducts from automobiles. Many of these contaminants could bind with sediment in the channel bed, where they could accumulate. When sediment is removed, toxic concentrations of contaminants could be present in the excavated sediment at levels considered hazardous if released into the environment. Additionally, excessive erosion and bank instability could occur near culvert outfalls, resulting in the need for bank repairs and disturbance of contaminated soils. Program Renewal workers who are in direct contact with soil or groundwater that contained hazardous levels of constituents would perform all activities in accordance with a site-specific hazardous operations health and safety plan, as outlined in Cal/OSHA standards which would reduce the potential for impacts associated with contaminated soil or groundwater. As described in Section 3.14, "Water Quality," Valley Water would also adhere to its Sediment Characterization Plan, which requires sediment testing to determine if soil is contaminated, to minimize impacts associated with soil disturbance. Furthermore, implementation of BMPs listed below would reduce potential impacts to unknown contaminated sites by testing soils in the Guadalupe River watershed for mercury and implementing appropriate remediation measures, minimizing the area of disturbance and stream access points, ensuring proper disposal of found hazardous materials, implementing spill prevention and response measures, and conducting a search of known contaminated sites prior to conducting maintenance work. As described in Section 3.14, "Water Quality," over the long-term, sediment removal and bank stabilization would improve channel conditions by removing existing contamination from the channel (both trash and contaminated sediments) and by reducing the potential for erosion and sediment transport from unstable banks, respectively.

Other Maintenance Activities

Other Program Renewal activities, such as management of animal conflicts, vegetation management, and minor maintenance activities, that involve minor ground disturbance could have the potential to disturb undiscovered contaminated sites. To minimize potential impacts from contaminated soil and groundwater, Program Renewal workers would comply with all applicable federal and state regulations and plans including a site-specific hazardous operations health and safety plan, as outlined in Cal/OSHA standards which would reduce the potential for impacts associated with contaminated soil or groundwater. Additionally as described in Section 3.14, "Water Quality," Valley Water would also adhere to its Sediment Characterization Plan, which requires sediment testing to determine if soil is contaminated, to minimize impacts associated with soil disturbance. Implementation of BMPs listed below would also minimize potential impacts to encountering unknown contaminated sites by testing soils in the Guadalupe River watershed for mercury and implementing appropriate remediation measures, minimizing the area of disturbance and stream access points, ensuring proper disposal of found hazardous materials, implementing spill prevention and response measures, and conducting a search of known contaminated sites prior to conducting maintenance work.

Applicable Best Management Practices

The BMPs summarized below would be implemented to reduce potential impacts associated with Program Renewal activities occurring on an unknown hazardous materials site. A full description of each BMP is provided in Chapter 2, *Project Description*.

- **BMP GEN-3: Avoid Exposing Soils with High Mercury Levels** requires sediment removal and bank stabilization activities occurring in portions of the Guadalupe River watershed affected by historic mercury mining to test soil for mercury and implement remediation activities if soils exceed established mercury levels. Workers will also be required to wear personal protective equipment to maintain exposure levels below OSHA standards.
- **BMP GEN-4: Minimize the Area of Disturbance** requires soil disturbance to be minimized to the maximum extent feasible.
- **BMP GEN-28: Stream Access** establishes temporary access points close to the work area and requires the use of existing exiting ramps and roads to minimize disturbance around the work area and to channels.
- **BMP GEN-30: Existing Hazardous Materials** ensures that hazardous materials found on site are disposed of properly according to applicable regulatory requirements.
- **BMP GEN-33: Spill Prevention and Response** ensures that Valley Water would have equipment and materials for cleaning up spills on site and that appropriate measures are followed to prevent impacts to natural resources.
- **BMP GEN-34: Existing Hazardous Sites** requires Valley Water to conduct a search for existing known contaminated sites as part of the annual NPW prior to conducing maintenance work.

Conclusion

If unknown contaminants were found during Program Renewal activities, the area would be treated as if a hazardous spill had occurred, and any ground-disturbing activities, including disturbance of previously undiscovered contamination or soils, would be handled in a manner that would protect both worker health and the environment, in compliance with all laws and regulations, including the preparation of a site-specific hazardous operations health and safety plan, as outlined in Cal/OSHA standards, which would reduce the potential for impacts associated with contaminated soil or groundwater. Therefore, with the implementation of the above-listed BMPs, ground-disturbing activities conducted under the Program Renewal would not create a significant hazard to the public or environment from unknown contaminated sites. Therefore, this impact would be **less than significant**.

Mitigation Measures: No mitigation is required.

Impact HAZ-5: Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within 0.25 Mile of an Existing or Proposed School (Less than Significant with Mitigation)

A total of 405 public schools are located in Santa Clara County (Santa Clara County Office of Education 2024) and 222 schools are located within 0.25 mile of a Program Renewal channel (refer to Table 3.8-4). Most of these schools are in session during a traditional school calendar year; however, some are open year-round. Thus, children may be present at schools during Program Renewal implementation and could potentially be exposed to hazardous materials or emissions associated with Program Renewal activities.

Heavy construction equipment used in Program Renewal activities would emit some diesel exhaust and related emissions that can be hazardous. In general, these emissions (if they were to occur in close proximity to a school) would be similar to emissions associated with road construction projects and other construction projects, which, by necessity, must occur in proximity to a school from time to time. While the amount and duration of the emissions would depend on the specific characteristics of the maintenance project, the emissions would be well below the exposure period of concern (i.e., the exposure periods for diesel PM are based on 9-, 40-, and 70-year periods) due to the short-term and highly variable nature of the emissions (refer to Section 3.3, "Air Quality," for more of a discussion on diesel exhaust and emissions). Therefore, diesel emissions would not pose an acute health hazard to children at any nearby school.

As described under Impact HAZ-1, the Program Renewal would transport, store, use, and dispose of hazardous materials, such as herbicides, fuel, oil, lubricants, and solvents. While it is possible that such handling of materials could occur in proximity to a school, these activities would not pose a significant health hazard to school children. The Program Renewal would implement BMPs that would require safe storage, handling, and disposal of hazardous materials and minimize the potential for accidental releases of hazardous materials to the environment. Ground-disturbing activities may be located in an area that supports NOA, as discussed under Impact HAZ-1, or that involves a risk of exposure to Valley Fever, as discussed in Impact HAZ-6. However, because schools are generally located within urban areas, there is a low likelihood of undisturbed soils containing NOA being present within 0.25 mile of a school. Nevertheless, the release of NOA or the fungus that causes Valley Fever into the air from ground-disturbing activities could expose schools to airborne hazards, such as

asbestos or Valley Fever. The exposure of children to asbestos is of particular concern because their longer life expectancy (from the date of exposure) exceeds the latency period for asbestos-related disease. Thus, impacts related to exposure of sensitive receptors to NOA during ground-disturbing activities would be significant. For the reasons explained under Impact HAZ-1, implementation of **Mitigation Measure HAZ-1** would reduce impacts associated with NOA and other airborne hazards on nearby schools to less than significant with mitigation. Impacts associated with exposure to Valley Fever are discussed below in Impact HAZ-6.

As described above, herbicides would be used under the Program Renewal; however, if herbicide use were to be required in immediate proximity to, or within, school grounds, Valley Water would be required to follow the Healthy School Act and implement associated regulations required by the California Education Code. Compliance with these existing laws and regulations would minimize potential hazards from herbicide use by restricting the use of certain herbicides, noticing for the application of herbicides at schools, and posting signage of where the herbicide will be applied.

Animal conflict management may include the use of fumigants which may occur in close proximity to or within school grounds. However, fumigant application would follow all label use restrictions and be placed directly in animal (squirrel or gopher) burrows to minimize any potential hazards from fumigant use. Additionally, no harmful rodenticides would be used under the Program Renewal.

Applicable Best Management Practices

The BMPs summarized below would be implemented to minimize potential impacts associated with the handling of hazardous materials in close proximity to schools. A full description of each BMP is provided in Chapter 2, *Project Description*.

- **BMP GEN-2: Instream Herbicide Application Work Window** establishes protection measures for the use of instream herbicides and prohibits the use of herbicides in certain conditions to reduce potential impacts associated with herbicide use.
- **BMP GEN-24: Work Site Housekeeping** requires the work site to be maintained in a neat and orderly condition, including storing materials and equipment to avoid leaks or other potential impacts associated with hazardous materials.
- **BMP GEN-26: Staging and Stockpiling of Materials** establishes requirements for staging and stockpiling materials to minimize potential impacts associated with these activities including storing materials away from areas where they could spill into waterbodies or storm drains.
- **BMP GEN-29: On-Site Hazardous Materials Management** requires the proper management of hazardous materials including storing hazardous materials and wastes in watertight containers with appropriate secondary containment. Generators and other equipment with the potential to leak or spill hazardous materials would also be stored and operated with secondary containment to prevent the release.
- **BMP GEN-30: Existing Hazardous Materials** requires the removal and disposal of hazardous materials found at maintenance sites in accordance with applicable regulatory requirements.

- **BMP GEN-31: Paving and Asphalt Work** requires Valley Water to avoid paving and seal coating in wet weather and when rain is forecasted to prevent hazardous materials from coming into contact with water.
- **BMP GEN-33: Spill Prevention and Response** includes the implementation of measures to prevent the accidental release of hazardous materials, specifies protocols for spill response and reporting, and requires that cleanup supplies are available on site.
- **BMP GEN-34: Existing Hazardous Sites** requires Valley Water to conduct a search for existing known contaminated sites during preparation of the NPW. For any ground-disturbing activities within 1,500 feet of an open contamination site, Valley Water will work with the RWQCB case manager to ensure maintenance activities would not affect cleanup work or threaten the public or environment.
- **BMP GEN-35: Fire Prevention** implements measures to reduce the risk of fire from maintenance activities by equipping equipment with spark arrestors, having fire suppression available at the work site, and keeping flammable materials away from equipment.
- **BMP GEN-36: Dust Management** requires Valley Water to implement the Bay Area Air District's Basic Dust Control Measures that include watering exposed soils, covering haul trucks, limiting vehicle speeds, among others to reduce fugitive dust that may contain NOA.
- **BMP GEN-37: Vehicle and Equipment Maintenance** requires that all equipment is kept clean to prevent the excessive buildup of oil and grease and that incoming vehicles and equipment are checked for leaking fluids.
- **BMP GEN-38: Vehicle Cleaning** requires that equipment be cleaned prior to transfer and use in a different watershed and vehicle and equipment washing will occur at approved wash areas in Valley Water's corporation yard.
- **BMP GEN-39: Vehicle and Equipment Fueling** prohibits fueling of vehicles and equipment in the channel or immediate floodplain and requires that designated fueling locations and secondary containment are provided to prevent the accidental release of fuel.
- **BMP GEN-44: Implement Public Safety Measures** includes posting signs warning the public and recreational users of construction, allowing trucks to pull into access points during temporary lane closures, installing safety fencing along active bank repair sites, and providing traffic control and site security when necessary.
- **BMP GEN-46: Planning for Pedestrians, Traffic Flow, and Safety Measures** includes measures for coordinating temporary lane closures with appropriate jurisdictional agencies and providing signage and flaggers.
- **BMP ANI-2: Prevent Harm to the Salt Marsh Harvest Mouse, California Ridgway's Rail, and California Black Rail** prohibits the use of fumigants within the range of salt marsh harvest mouse, California's Ridgway's Rail, or California Black Rail as identified on the range maps for the Program Renewal.
- **BMP ANI-3: Burrowing Owl Buffer Zone** prohibits fumigant use within known burrowing owl locations.

- **BMP ANI-4: Animal Control in Sensitive Amphibian Habitat** prohibits the use of harmful rodenticides in the Program Renewal and prohibits the use of fumigants within habitat areas of special-status amphibians.
- **BMP HM-4: Posting and Notification for Pesticide Use** requires posting of areas where pesticides will be used.

Conclusion

Implementation of the above-listed BMPs would minimize the potential risks associated with the use of or exposure to hazardous materials during Program Renewal activities near schools, by properly storing and managing these materials, minimizing the transport of these materials to any local waterbodies, notifying local residents of the use of pesticides, and designing bait traps for targeted species (that typically would have standard design features, such as openings that would be difficult for non-target species to enter). However, impacts associated with NOA would still be significant. Implementation of **Mitigation Measure HAZ-1** would reduce impacts associated with NOA at nearby schools. Therefore, the impact would be **less than significant with mitigation**.

> **Mitigation Measure HAZ-1: Implement Dust Control Measures in Areas Containing NOA** (Refer to Impact HAZ-1 above)

Impact HAZ-6: Create a Significant Hazard to Construction Workers or the Public Through the Exposure to Valley Fever During Construction Activities (Less than Significant with Mitigation)

As described under Section 3.8.3, "Environmental Setting," the soil-dwelling fungus, Coccidioides, that causes Valley Fever is present within Santa Clara County, although it is not present at high endemic levels. Although Valley Fever is relatively uncommon, it may be present in the soils within the Program Renewal Area. Thus, ground-disturbing activities including sediment removal and bank stabilization, management of animal conflicts, and other minor maintenance (e.g., limited grading) conducted under the Program Renewal would disturb the soil and potentially release the fungus into the air if it is present on-site.

Program Renewal activities would be conducted in accordance with relevant health and safety requirements, including OSHA and Cal/OSHA requirements and regulations in Title 8 of the Cal. Code of Regs. to address potential release of Valley Fever spores associated with soils disturbance. In compliance with these requirements, the construction contractor would provide awareness training to workers and provide protection against Valley Fever spores to minimize the public and worker exposure to Valley Fever. Additionally, Valley Water would comply with BMP GEN-36 (Dust Management), which requires the implementation of dust control measures such as watering disturbed soils, covering haul trucks, limiting vehicles speeds to 15 mph, minimizing idling times. Compliance with BMP GEN-36 (Dust Management) would control and minimize the potential release of Valley Fever spores into the air. Furthermore, many of the ground-disturbing activities conducted under the Program Renewal would occur in areas that are frequently disturbed; therefore, there would be a lower likelihood of the fungus being present within these areas and being released into the air.

However, a significant impact may still occur to the public or maintenance workers when ground-disturbing activities occur in undisturbed soils that have a higher likelihood of containing the fungus that causes Valley Fever. Implementation of **Mitigation Measure HAZ-1** would minimize risks from soil that may contain the fungus that causes Valley Fever by requiring implementation of additional dust control and track-out control measures in undisturbed areas to minimize dust, and requiring Valley Water Operations and Maintenance staff to consult with Valley Water Environmental Health and Safety staff to establish any additional measures to reduce the risk of Valley Fever infection if Valley Fever reaches highly endemic levels in Santa Clara County. Through the implementation of **Mitigation Measure HAZ-1**, impacts related to hazards to the public and the environment through the exposure to Valley Fever would be less than significant with mitigation.

Applicable Best Management Practices

The BMP summarized below would be implemented to reduce potential impacts associated with exposure of maintenance workers and the public to Valley Fever during Program Renewal activities. A full description of each BMP is provided in Chapter 2, *Project Description*.

- **BMP GEN-36: Dust Management** requires Valley Water to implement Bay Area Air District's Basic Dust Control Measures that include watering exposed soils, covering haul trucks, limiting vehicle speeds, among others to reduce fugitive dust that may contain the fungus that causes Valley Fever.

Conclusion

Implementation of BMP GEN-36 (Dust Management) and compliance with OSHA and Cal/OSHA requirements and regulations in the Cal. Code of Regs, Title 8, Industrial Relations would minimize potential impacts from Valley Fever exposure during ground disturbing activities in disturbed areas. However, a significant impact may still occur when ground-disturbing activities occur in undisturbed areas that have a higher likelihood of containing the fungus that causes Valley Fever. Implementation of **Mitigation Measure HAZ-1** would further minimize risks from undisturbed soil that may contain the fungus that causes Valley Fever by requiring the implementation of additional dust control and track-out control measures to minimize dust emissions and consultation between Valley Water departments if Valley Fever reaches highly endemic levels in Santa Clara County. Therefore, impacts related to hazards to the public or environment through the exposure to Valley Fever would be **less than significant with mitigation**.

> **Mitigation Measure HAZ-1: Implement Dust Control Measures in Areas Containing NOA and in the Event of High Risk of Valley Fever** (Refer to Impact HAZ-1 above)

This page intentionally left blank

3.9 Hydrology and Geomorphology

3.9.1 Introduction

This section presents the regulatory setting, environmental setting, and potential impacts of the Santa Clara Valley Water District's (Valley Water's) Stream Maintenance Program Renewal (Program Renewal) as related to hydrology and geomorphology.

Hydrology is the science (or study) of water in the natural environment, with a focus on the circulation and distribution of water as expressed in the hydrologic cycle or water balance (Goudie 1994). Geomorphology is the study of the earth's surface, its landforms, and the processes that shape them. Within geomorphology, fluvial geomorphology is the more specific study of rivers and streams, and typically includes aspects of hydrology (the quantity and timing of watershed runoff that enters the river), hydraulics (the behavior of channelized flows in the river), and sediment dynamics (how sediment is variably eroded, transported, and deposited along the river continuum).

This section evaluates the potential for Program Renewal activities to affect the geomorphic form and function of rivers and creeks in the Program Renewal Area, particularly as it relates to erosion, sedimentation, and flooding, in accordance with the significance criteria established under the California Environmental Quality Act (CEQA). The section also evaluates impacts on groundwater supplies and recharge, and creation of surface runoff and impacts on stormwater drainage systems. This section supports the information presented in Section 3.4, "Biological Resources," and Section 3.14, "Water Quality."

3.9.2 Regulatory Setting

The following subsections discuss federal, state, and regional laws and regulations that pertain to hydrology and geomorphology for the Program Renewal. Applicable local plans, policies, regulations, and ordinances related to hydrology and geomorphology are included in **Appendix C**, *General Plan Policies and Ordinances*. In summary, Appendix C discusses several plans throughout Santa Clara County and local jurisdictions that contain relevant strategies, policies, and goals for conserving and reclaiming water, implementing flood protection, maintaining and enhancing the health of groundwater basins, maintaining and improving storm drainage facilities, minimizing stormwater runoff and erosion impacts, protecting life and minimizing property damage from potential flood hazards, and conserving creeks and riparian areas.

Federal Plans, Policies, Regulations, and Laws

Clean Water Act

The Clean Water Act (CWA) is the primary federal law that protects the quality of the nation's surface waters, including lakes, rivers, and coastal wetlands. Refer to Section 3.14, "Water Quality," for a detailed discussion of the CWA, including Sections 303, 401, 402, and 404. The Construction General Permit and Municipal Regional Stormwater National Pollutant Discharge Elimination System (NPDES) Permit, which are implemented at the State level pursuant to CWA Section 402, are also discussed in Section 3.14, "Water Quality."

National Flood Insurance Act of 1968 and Flood Disaster Protection Act of 1973

The National Flood Insurance Act of 1968 (42 United States Code [USC] 4001 et seq.) provides federally backed flood insurance to communities that enact and enforce floodplain regulations. As part of its flood insurance program, the Federal Emergency Management Agency (FEMA) has developed a Community Rating System, which rewards communities that practice proactive flood management and educational activities above and beyond the minimum requirements of the National Flood Insurance Program (NFIP). The reward is an across-the-board reduction in insurance premiums for residents and businesses in a participating community. The Flood Disaster Protection Act of 1973 (42 USC 4001 et seq.) expanded the NFIP by increasing limits of coverage and by requiring known flood-prone communities to participate in the NFIP.

FEMA Levee Design and Maintenance Regulations

Guidance and criteria for levees included in the NFIP are provided in the FEMA Levee Design and Maintenance Regulations (44 Code of Federal Regulations [CFR] 65.10). Major criteria include freeboard, closure structures, embankment protection, embankment and foundation stability, settlement, interior drainage, and other design criteria. Operation and maintenance requirements are also discussed. Each of these criteria includes specific design guidelines that must be met in order for the levee to remain in the NFIP.

State Plans, Policies, Regulations, and Laws

Porter-Cologne Water Quality Control Act

Refer to Section 3.14, "Water Quality," for discussion of the Porter-Cologne Act. As described therein, the Porter-Cologne Act requires the regional water quality control boards (RWQCBs) to adopt Basin Plans for the protection of surface water and groundwater quality.

California Fish and Game Code Section 1602 – Lake and Streambed Alteration Agreement Program

Under Section 1602 of the California Fish and Game Code (F&G Code), the California Department of Fish and Wildlife (CDFW) regulates projects that affect the flow, channel, or banks of rivers, streams, and lakes. Section 1602 requires public agencies and private individuals to notify and enter into a streambed or lakebed alteration agreement with CDFW before beginning construction of a project that will substantially divert, obstruct, or change the natural flow or the bed, channel, or bank of any river, stream, or lake, or use materials from a streambed.

Section 1602 contains additional prohibitions against the disposal or deposition of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into any river, stream, or lake. Section 1602 may apply to any work undertaken within the 100-year floodplain of any body of water or its tributaries, including intermittent stream channels. In general, however, it is construed as applying to work within the active floodplain and/or associated riparian habitat of a wash, stream, or lake that provides benefit to fish and wildlife. It typically does not apply to drainages that lack a defined bed and banks, such as swales, or to very small bodies of water and wetlands such as vernal pools.

California Statewide Groundwater Elevation Monitoring Basin Prioritization

In 2009, the California State Legislature amended the California Water Code with SBx7-6, which mandates a statewide groundwater elevation monitoring program to track seasonal and long-term trends in groundwater elevations in California. Under this amendment, the California Department of Water Resources (DWR) established the California Statewide Groundwater Elevation Monitoring program (CASGEM), which established the framework for regular, systematic, and locally managed monitoring in all of California's groundwater basins. The CASGEM program is essential to DWR's ranking all of California's basins by priority: high, medium, low, and very low. DWR's basin prioritization is based on the following factors:

1. Population overlying the basin or subbasin
2. Rate of current and projected growth of the population overlying the basin or subbasin
3. Number of public supply wells that draw from the basin or subbasin
4. Total number of wells that draw from the basin or subbasin
5. Irrigated acreage overlying the basin or subbasin
6. Degree to which persons overlying the basin or subbasin rely on groundwater as their primary source of water
7. Any documented impacts on the groundwater within the basin or subbasin, including overdraft, subsidence, saline intrusion, and other water quality degradation
8. Any other information determined to be relevant by DWR

The Santa Clara Subbasin (2-009.02) and Llagas Area Subbasin (3-003.01) underlie the Program Renewal Area. Both of these subbasins are designated as high priority under CASGEM and DWR's basin prioritization (DWR 2024).

Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act (SGMA) became law in 2015 and created a legal and policy framework to manage groundwater sustainably at a local level. SGMA allows local agencies to customize groundwater sustainability plans (GSPs) to their regional economic and environmental conditions and needs and establish new governance structures, known as groundwater sustainability agencies (GSAs). SGMA requires that GSAs develop GSPs or prescribed alternatives for groundwater basins designated as high and medium priority by DWR. GSPs are intended to facilitate the management of groundwater supply and use in a manner that avoids specific undesirable results. Undesirable results are defined as the following:

- Chronic lowering of groundwater levels (not including overdraft during a drought if a basin is otherwise managed);
- Significant and unreasonable reduction of groundwater storage;
- Significant and unreasonable seawater intrusion;
- Significant and unreasonable degraded water quality, including the migration of contaminant plumes that impair water supplies;
- Significant and unreasonable land subsidence that substantially interferes with surface land uses; and

- Depletions of interconnected surface water that have significant and unreasonable adverse impacts on beneficial uses of the surface water.

GSPs are required to include measurable objectives and minimum thresholds, as well as interim milestones in 5-year increments, to achieve the sustainability goal for the basin for the long-term beneficial uses of groundwater. Additionally, GSPs are required to include components related to groundwater quality monitoring, the monitoring and management of groundwater levels within the basin, mitigation of overdraft, and a description of surface water supply used or available for use for groundwater recharge or in-lieu use.

Valley Water is the GSA for the Santa Clara Subbasin (2-009.02) and Llagas Area Subbasin (3-003.01), which underlie the Program Renewal Area. Valley Water has developed a Groundwater Management Plan (GWMP), which serves as an Alternative to a GSP, as discussed further below.

Regional Plans, Policies, Regulations, and Ordinances

Valley Water's Water Resources Protection Ordinance 06-1

Valley Water manages water resources under Water Resource Protection Ordinance 06-1. This ordinance protects water resources managed by Valley Water by regulating modifications, entry, use or access to Valley Water facilities and/or Valley Water easements. The ordinance clarifies the governance of lands along and adjacent to streams, provides model Guidelines and Standards for management of these lands, and reinforces the role of local jurisdictions in regulating land use, but encouraging consultation with Valley Water regarding lands they manage.

In an effort to clarify and streamline local permitting for streamside activities, representatives from Valley Water, cities, the County, and business, agriculture, streamside property owner, and environmental interests created a partnership known as the Water Resources Protection Collaborative. Together the collaborative developed a manual of model guidelines and standards for land-use near streams.

Valley Water's Groundwater Management Plan for the Santa Clara and Llagas Subbasins

Valley Water's 2016 GWMP for the Santa Clara and Llagas Subbasins was submitted to and approved by DWR as an Alternative to a GSP. Valley Water subsequently submitted the 2021 GWMP to DWR in accordance with the periodic evaluation for the approved Alternative – and it was approved by DWR in 2024. The 2021 GWMP supersedes all previous GWMPs and is the current version in effect. The GWMP describes Valley Water's comprehensive groundwater management framework, including existing and potential actions to achieve basin sustainability goals and ensure continued sustainable groundwater management. The GWMP includes the following sustainability goals related to groundwater supply reliability and protection (Valley Water 2021):

- Manage groundwater to ensure sustainable supplies and avoid land subsidence.
- Aggressively protect groundwater from the threat of contamination.

These goals describe the overall objectives of Valley Water's groundwater management programs. The GWMP then includes basin management strategies to meet the sustainability goals. Many of the strategies have overlapping benefits, acting to improve water supply

reliability, minimize subsidence, and protect or improve groundwater quality, as follows (Valley Water 2021):

1. Manage groundwater in conjunction with surface water.
2. Implement programs to protect and promote groundwater quality.
3. Maintain and develop adequate groundwater models and monitoring networks.
4. Work with regulatory and land use agencies to protect recharge areas, promote natural recharge, and prevent groundwater contamination.

Finally, the GWMP includes sustainability indicators and outcome measures to gauge performance in meeting the basin sustainability goals, as shown in **Table 3.9-1** below (based on Table ES-1 in the GWMP).

Table 3.9-1. Groundwater Management Plan Outcome Measures and Outcome Measure – Lower Thresholds

Sustainability Indicator	Outcome Measure	Outcome Measure – Lower Threshold
Groundwater Storage	Projected end of year groundwater storage is greater than 278,000 AF in the Santa Clara Plain, 5,000 AF in the Coyote Valley, and 17,000 AF in the Llagas Subbasin.	Projected end of year countywide groundwater storage is greater than Stage 5 (150,000 AF) of the Water Shortage Contingency Plan.
Subsidence	Groundwater levels are above subsidence thresholds at the Santa Clara Plain subsidence index wells.	Groundwater levels are above the historical low water levels at the majority of the Santa Clara Subbasin subsidence index wells.
Groundwater Quality	For Santa Clara Subbasin water supply wells, at least 95% meet primary drinking water standards, and at least 90% have stable or decreasing trends for total dissolved solids (TDS).	At least 70% of water supply wells have stable or decreasing trends for nitrate and TDS.
Groundwater Quality	For Llagas Subbasin water supply wells, at least 95% meet primary drinking water standards, and at least 90% of wells have stable or decreasing trends for TDS.	At least 70% of water supply wells have stable or decreasing trends for nitrate and TDS.
Seawater Intrusion	In the Santa Clara Subbasin shallow aquifer, the 100 milligram per liter isocontour areas is less than the historical maximum extent area (57 square miles).	In the Santa Clara Subbasin shallow aquifer, the 100 milligram per liter chloride isocontour area is less than 81 square miles, which represents a one-mile radial buffer of the historical maximum extent area.

Notes: Based on Table ES-1 in the GWMP (Valley Water 2021).
AF = acre-feet; TDS = total dissolved solids

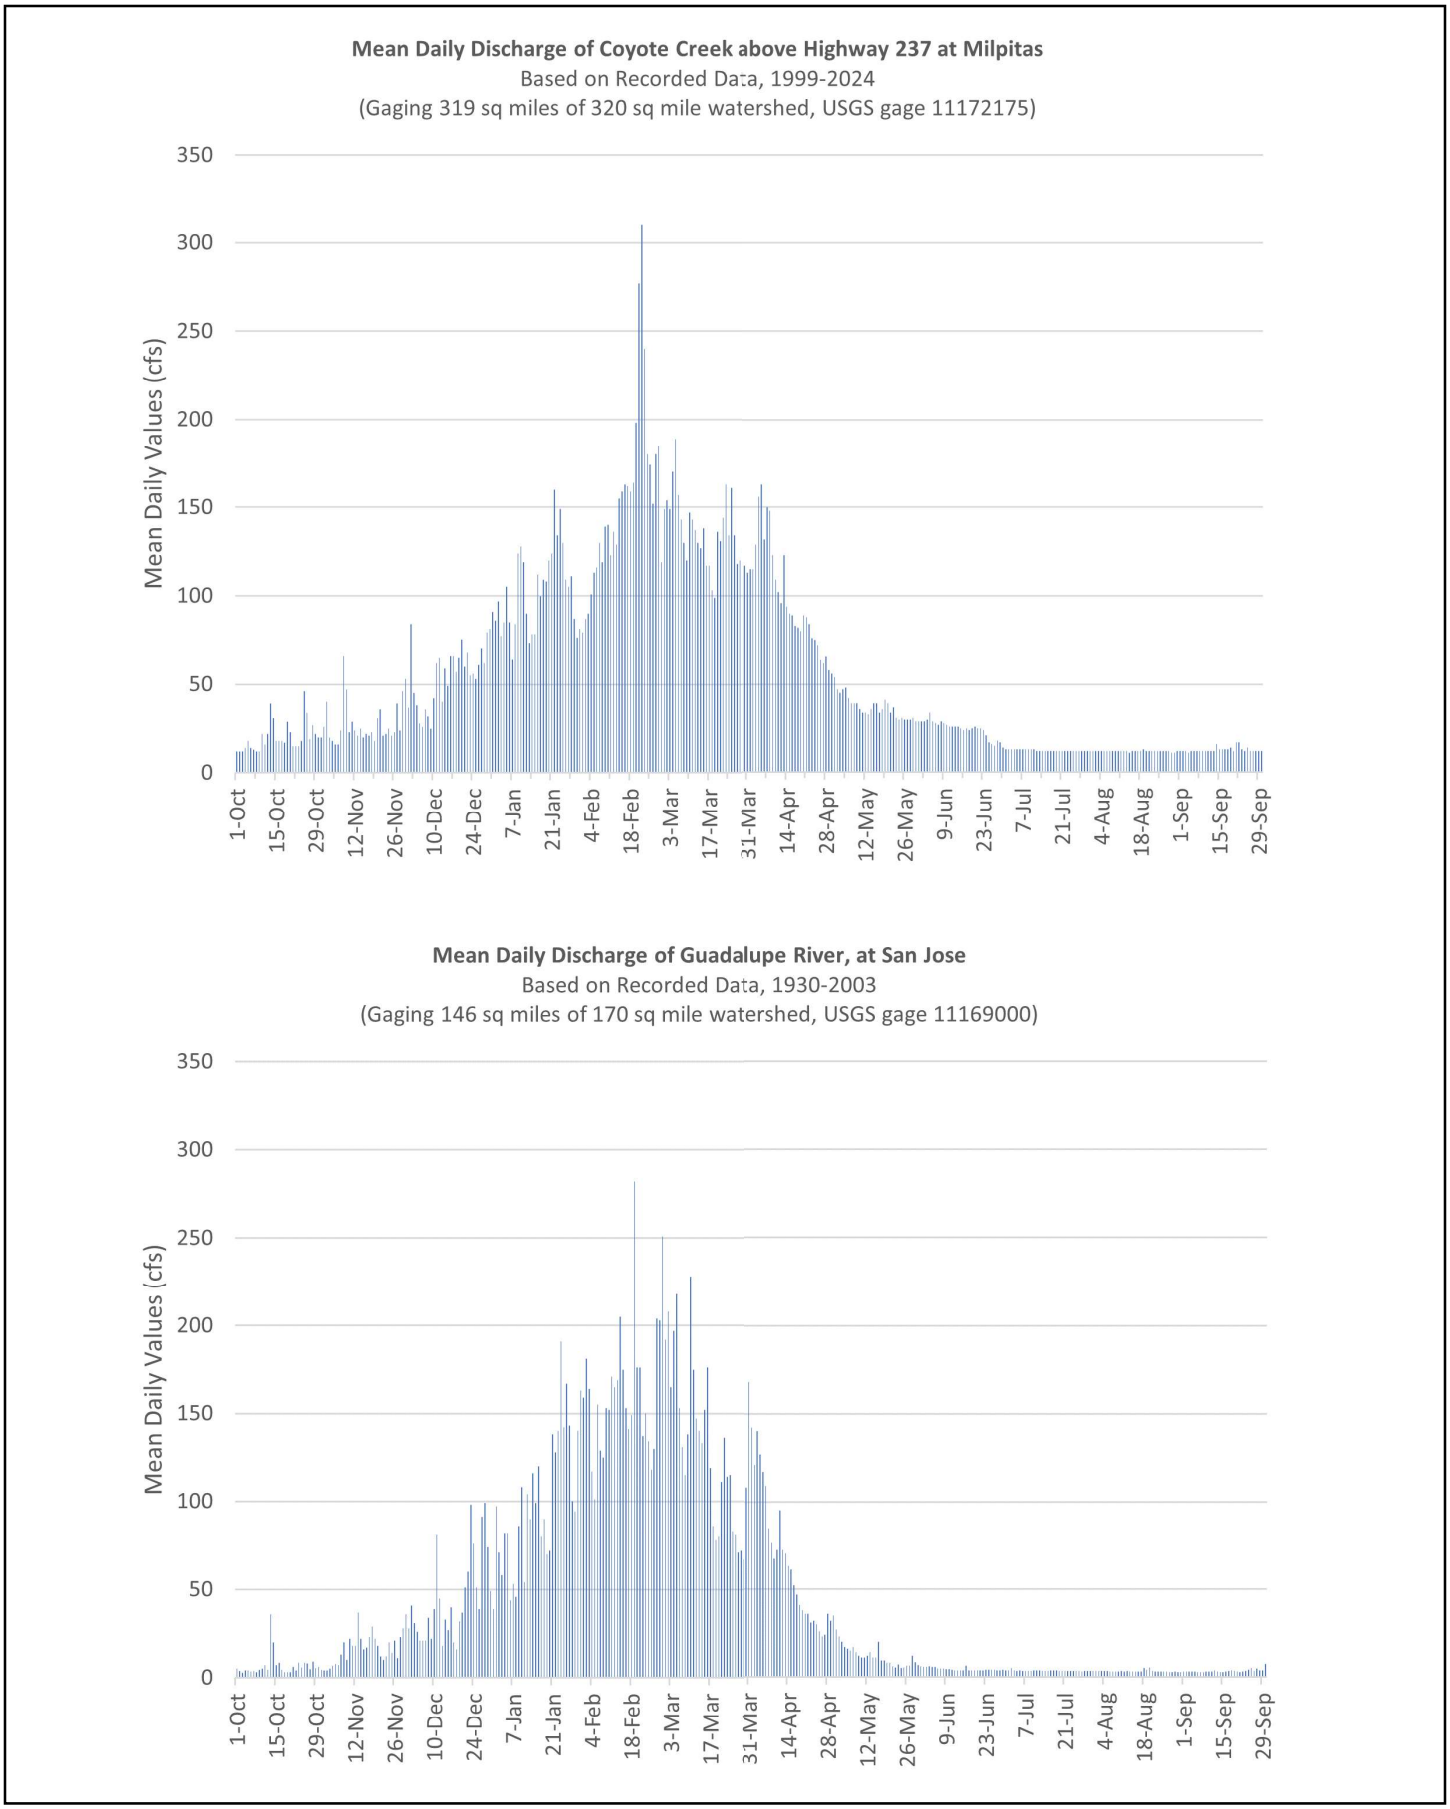
3.9.3 Environmental Setting

Climate and Hydrology

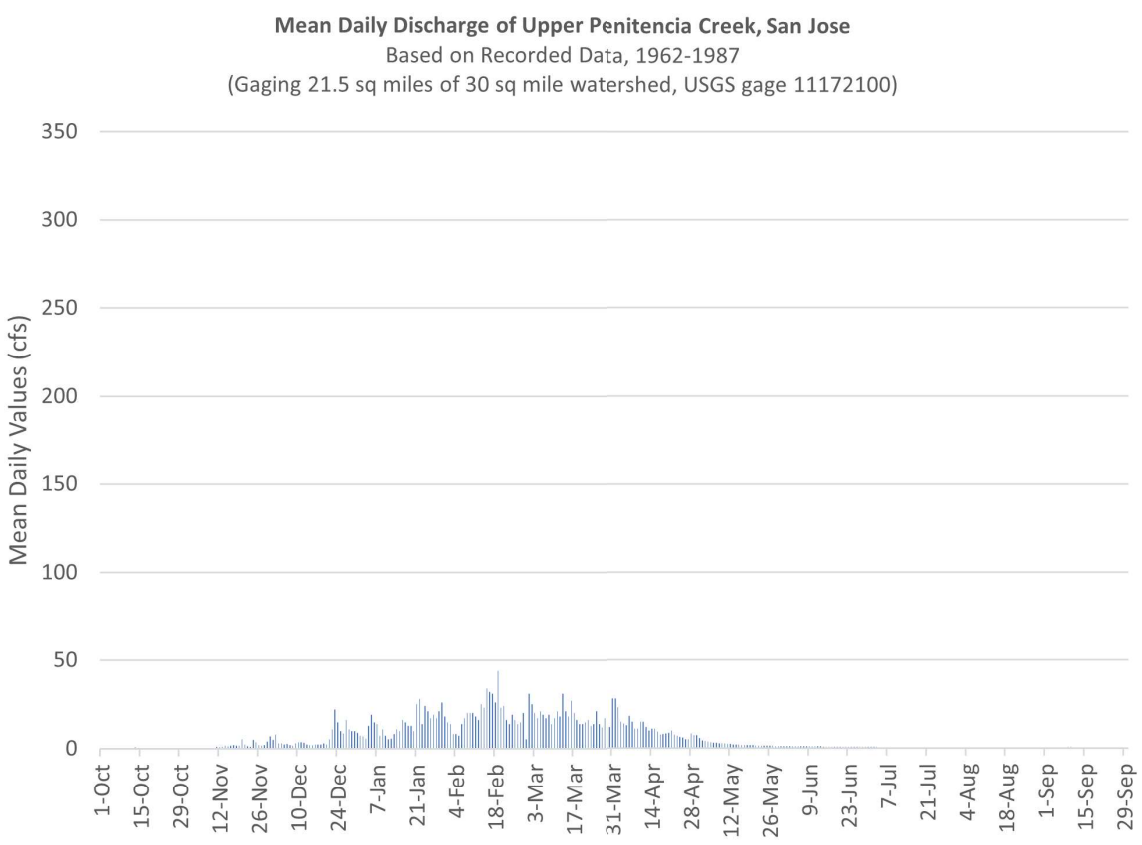


Surface water hydrology (primarily runoff and stream flow) is largely a function of climate, land cover, and soil. In much of California, including Santa Clara County, surface hydrology also is influenced by water resources management that may capture, store, release, or transfer surface water across or between watersheds. The Program Renewal Area experiences a Mediterranean climate, characterized by warm, dry summers and cool, wet winters. Precipitation is mainly concentrated in the winter months and falls primarily as rain, though the high elevations of the Santa Cruz Mountains and Diablo Range can receive limited snowfall. Weather in the region is subject to high annual variability as well as longer-term climatic cycles, including the Pacific-North American Oscillation, the El Niño Southern Oscillation, and the Pacific Decadal Oscillation (Andrews et al. 2004:337–348). These cycles affect temperature, precipitation, and the frequency of extreme weather events.

The Santa Cruz Mountains area receives the highest average rainfall totals in the county, ranging from 30 to 50 inches per year. Whereas the Diablo Range in the eastern Program Renewal Area receives substantially less average rainfall than the Santa Cruz Mountains, ranging from 20 to 32 inches, caused by a "rain shadow" effect as fronts move from the ocean over ranges toward the interior.

Rainfall, land cover, soil structure, soil moisture, slope, watershed size, reservoir operations, and other factors all influence the magnitude and duration of flows (or discharge) in rivers and streams in the Program Renewal Area. Urbanized lands with a higher proportion of impervious surfaces and reduced infiltration generally demonstrate a rapid runoff response to rainfall events. Such "flashy" hydrologic systems are noted for the short lag-times between rainfall and peak discharge and show very steep (needle-like) rising limbs of storm hydrographs[1]. Unregulated streams (i.e., those without water supply reservoirs, or located above impoundments) also may show more rapid runoff response compared to streams that have structural features that provide runoff retention or detention. Although typically unregulated, streams tend also to be surrounded by land uses that have higher rates of infiltration, reducing the amount of runoff.

Many of the streams in the Program Renewal Area are downstream of dams, and flows on these streams are regulated by these dams for water supply purposes. On regulated creek systems, peak discharges are reduced, the frequency/duration relationships are more equitable (less extreme), and base flow discharge (non-storm flow) typically extends into the later spring, summer, and fall months compared to non-regulated streams. Also, several of the reservoirs in the Program Renewal Area release flow through the summer months to recharge groundwater aquifers. **Figures 3.9-1a, 3.9-1b, 3.9-2, and 3.9-3** show streamflow data for representative streams within the Program Renewal Area.



[1] A hydrograph is a graph or measure of stream flow over time, typically with discharge plotted along the vertical axis and time charted along the horizontal axis.

Geology and Geomorphology

Many factors influence the geomorphology of rivers and streams, including geology, hydrology, climate, land use, and vegetation. With respect to the regional geology, Santa Clara County is situated in the Central Coast Range province of California. The Central Coast Range is characterized by its northwest-southeast trending mountain ranges. Typically, the ranges are separated by structural depressions (valleys) that fill with alluvium (stream transported sediment) derived from the adjacent ranges. Most often, the alluvial valleys contain a primary or "trunk" stream that collects runoff and sediment from the side valley tributary streams (generally to the east and west) that ascend higher in the contributing watershed toward the ridgelines.

This general pattern holds true in Santa Clara County, with the Santa Cruz Mountains to the west and the southern Diablo Range to the east. These two ranges frame the Santa Clara Basin below, which drains to San Francisco Bay. In the southern Program Renewal Area, the Gilroy Valley of the Pajaro Watershed serves as the central alluvial valley between the Santa Cruz Mountains and Diablo Ranges. The Pajaro Watershed drains to Monterey Bay. The ridge-valley structure of Santa Clara County presents a three-part continuum of geomorphic conditions, with crystalline or bedrock areas in the upper watersheds, transitioning to foothill alluvial fans, then to lower watershed bays and alluvial plains. These geomorphic zones are described below, following Helley et al. (1979) and Valley Water (2022).

Bedrock Uplands

Bedrock uplands form the steep, mountainous headwater terrain of the principal drainages in the Program Renewal Area. In the western Program Renewal Area (see **Figure 2-1** in Chapter 2, *Project Description*), the eastern slopes of the Santa Cruz Mountains form the headwaters of many Program Renewal Area waterways, including San Francisquito Creek, Adobe Creek, and the Guadalupe River. The underlying bedrock geology in this region is commonly the Franciscan Complex, a formation of compressed, uplifted, and rotated marine sedimentary materials that was deposited in the early Cretaceous Period (approximately 146 to 100 million years ago) (Norris and Webb 1990; Sullivan and Galehouse 1991). Locally, younger Mesozoic meta-sedimentary and volcanic rocks with smaller quantities of Tertiary sandstones, siltstones, and mudstones are exposed (PWA 2002). In the eastern Program Renewal Area, elevations in the Diablo Range vary from 500 to 2,800 feet above mean sea level, with slopes similar to those on the eastern Santa Cruz Mountains (Valley Water 2001). In addition to the Franciscan Complex geology, the Diablo Range includes the characteristic sandstone and mudstone depositional layers of the Great Valley Sequence.

Stream channels in bedrock upland areas are steep and often flow through deeply incised valleys with little or no floodplain area. In several drainages (e.g., Coyote, Alamitos, Guadalupe, and Los Gatos Creeks), the existence of reservoirs has effectively reduced the delivery of coarse sediment from the watershed uplands to the alluvial fans/plains below. The fine material (typically finer material and washload held in suspension) that is not trapped by reservoirs is transported downstream and can collect and deposit in the stream channels of the Program Renewal Area (SCVURPPP 2019).

Foothill Alluvial Fans

The foothill alluvial fans in the Program Renewal Area are found downstream of the bedrock uplands and provide a topographic transition to the alluvial plains further downstream in the

watershed. Alluvial fans collect stored sediment, much of it coarse gravel and sand. In the Coast Ranges, alluvial fans are typically geologically young depositional landforms from the Quaternary Period (the last 1.8 million years). Although depositional when viewed through longer geologic time scales, in the short term, present-day alluvial fans can function variably as zones of sediment erosion, sediment transport, or sediment deposition. Many of the current alluvial fan channels in the Program Renewal Area, particularly in the upper fan zones, are incising and transporting coarse sediments downstream (PWA 2019). Gullying and headward erosion through the alluvial fans in many instances have been caused or exacerbated by historic land use practices, development encroachment on stream corridors, and the channelization of streams that have essentially fixed their locations. Where streambanks have been artificially steepened, rotational slumps (the movement of a mass of soil and rock downslope and rotating) and other slope failures can occur (Valley Water 2001).

Bay Plain and Alluvial Valleys

The floodplains and alluvial valleys situated between the foothills and San Francisco Bay are formed of relatively young sedimentary deposits, dating from the Holocene epoch of the last 10,000 years. Sediment grain sizes are coarsest near the foothills and alluvial fans and become finer moving downstream toward San Francisco and Monterey Bays. Whereas upper alluvial fans may slope up to a 5 percent gradient, in the lower plain regions stream slopes typically are less than 1 percent. The lower bay plain is composed of medium to fine grained alluvium and estuarine deposits. Many of these deposits were laid during estuarine backwater flooding conditions when winter stream flows met high tides (PWA 2002). Near the margins of San Francisco Bay, estuarine sediments intergrade with fine alluvium in the deltas of Valley Water-maintained streams; extensive areas of artificial fill and diked baylands also are found.

Program Renewal Area Watersheds and Streams

The Program Renewal Area includes two primary watersheds: the Santa Clara Basin and the Pajaro Basin. For the purposes of resource management, Valley Water has divided the Santa Clara Basin further into four watershed management areas (WMA): Lower Peninsula, West Valley, Guadalupe, and Coyote WMAs. The Pajaro Basin includes the Uvas-Llagas WMA. These watersheds and WMAs are discussed further below.

In Chapter 2, *Project Description,* Figure 2-1 shows the Program Renewal Area, including the Santa Clara Basin and Pajaro Basin. **Figures 2-2 through 2-6** shows each of the WMAs within the Program Renewal Area in more detail, including the channel type distribution (i.e., modified, unmodified, unknown) within the WMA. Additionally, **Figure 3.9-4** below shows an overview of the watersheds and WMAs. Finally, **Table 3.9.2** in this section provides a summary of the main creeks and their drainages in each WMA.

Santa Clara Basin

The Santa Clara Basin includes approximately half of Santa Clara County and small parts of San Mateo and Alameda Counties (Figure 2-1). The Santa Clara Basin consists of San Francisco Bay south of the Dumbarton Bridge and the 824 square miles that drain, generally in a northerly direction, to the Bay. The Diablo Range and the Santa Cruz Mountains form the eastern, western, and southern basin boundaries. Land uses within the Santa Clara Basin range from residential, commercial, and industrial uses in the northern portion of the basin to a primarily rural southern portion with cattle ranching, water-supply catchments, and scattered low-density residential development (Santa Clara Basin Watershed Management Initiative [SCBWMI] 2003). As noted above, Valley Water has subdivided the Santa Clara Basin into four WMAs, each of which is discussed further below.

Lower Peninsula WMA

The Lower Peninsula WMA (98 square miles) is located in the northwest portion of the Santa Clara Basin (Figures 2-1 and 2-2, and Figure 3.9-4). The Lower Peninsula headwaters begin in the Santa Cruz Mountains at elevations greater than 2,500 feet. Tributary creeks fall steeply from the headwaters region to the more gently sloping alluvial fans and plains. Major streams under Valley Water's management within the Lower Peninsula WMA include San Francisquito, Stevens, Permanente, Adobe, Barron, and Matadero creeks (WMI 2007). These streams generally flow northward, conveying flows to the Palo Alto Flood Basin and, ultimately, San Francisco Bay. However, portions of Buckeye, Adobe, Permanente, and Stevens creeks flow more easterly/westerly, where their stream valleys follow the San Andreas Fault Zone, which disrupts their drainage pattern (Figure 2-2). As shown in Figure 2-2, the vast majority of the lengths of streams within the Lower Peninsula WMA (particularly the portions passing through urbanized areas closer to the Bay) are modified channels.

San Francisquito Creek marks the border between Santa Clara and San Mateo counties. Valley Water only maintains the side of the creek that is within Santa Clara County. Up to 1,500 cfs of runoff in Permanente Creek may be diverted to Stevens Creek via the Permanente Creek Diversion (Figure 2-2), built in 1959. During storm events, high flows from Barron Creek may be diverted to Matadero Creek via the Barron Creek Bypass structure. Valley Water manages

Stevens Creek Reservoir (3,465 acre-feet), the largest reservoir in the Lower Peninsula WMA, for water supply storage purposes with incidental flood protection benefits[2].

Land uses in the Lower Peninsula WMA generally consist of open space and low-density residential development in the upper watershed, with higher density residential and commercial development on the valley floor. Municipalities that are partially or entirely with the WMA include Los Altos Hills, Palo Alto, Mountain View, Los Altos, Cupertino, and Sunnyvale. A large quarry is located in the upper Permanente Watershed and mines limestone for cement production.

West Valley WMA

The West Valley WMA (85 square miles) is situated southeast of the Lower Peninsula WMA and northwest of the Guadalupe WMA (Figures 2-1 and 2-3, and Figure 3.9-4). The major natural drainages in this WMA are Calabazas, San Tomas Aquino, and Saratoga creeks. These streams begin as natural channels at relatively low elevations in the Santa Cruz Mountains (less than 1,500 feet) (WMI 2007). As these streams transition from the alluvial fan regions to the Bay plain, they become highly modified channels that traverse the Bay plain and ultimately discharge to Guadalupe Slough. The Sunnyvale West and East Channels, constructed channels that provide drainage for large portions of Sunnyvale, also discharge to Guadalupe Slough. Figure 2-3 shows that the vast majority of stream lengths in the West Valley WMA are modified channels.

Like much of the western Santa Clara Basin, land use in the upper West Valley WMA is primarily forest or undeveloped rangeland with low-density residential development, while the lower watershed is highly developed for residential and commercial uses. However, within the Calabazas drainage, several areas of heavy industry are present in the upper watershed. Municipalities that are partially or entirely within this WMA include Sunnyvale, Santa Clara, Cupertino, San Jose, Santa Clara, Campbell, Monte Sereno, Los Gatos, and Saratoga (SCBWMI 2003).

Guadalupe WMA

The Guadalupe WMA (Figures 2-1 and 2-4, and Figure 3.9-4) drains approximately 170 square miles, beginning in the eastern Santa Cruz Mountains near the summit of Loma Prieta (3,790 feet above mean sea level) and eventually discharging to San Francisco Bay via Alviso Slough. The Guadalupe River, the largest drainage in the watershed, begins at the confluence of Alamitos and Guadalupe creeks and flows north through heavily urbanized portions of San Jose and Santa Clara to Alviso Slough. Alamitos Creek flows northwesterly to Almaden Reservoir (2,000 acre-feet), and then flows northerly to its confluence with Calero Creek, and eventually to its confluence with Guadalupe Creek. Three main tributaries, Ross, Canoas, and Los Gatos creeks, join the Guadalupe River on the Bay plain as it flows north towards the Bay. As shown on Figure 2-4, the vast majority of the stream lengths within the Guadalupe WMA are modified channels.

Valley Water operates five reservoirs in the Guadalupe WMA for water supply storage purposes (with incidental flood protection benefits): Guadalupe, Calero, Almaden, Lexington,

[2] Valley Water does not conduct maintenance activities at reservoirs or dams as part of its Stream Maintenance Program. However, stream maintenance at the reservoir outfall below the dam is included, as is any necessary stream maintenance upstream of the reservoir (below the 1,000-foot contour).

and Vasona Reservoirs. Municipalities that are partially or entirely within this WMA include Campbell, Santa Clara, Los Gatos, Monte Sereno, and San Jose.

Coyote WMA

The Coyote WMA is the largest watershed in the Santa Clara Basin, encompassing over 320 square miles (Figures 2-1 and 2-5, and Figure 3.9-4). The Coyote WMA drains the west-facing slopes of the Diablo Range that lie within the Santa Clara Basin. The eastern and southern portions of the watershed are upland areas with elevations up to 4,000 feet above mean sea level; the northern and western portions encompass the valley floor. Coyote Creek is the principal drainage in the watershed; 29 major tributaries drain into Coyote Creek including Upper Penitencia Creek, Berryessa Creek, Lower Silver Creek, and Fisher Creek (SCVWD 2001). Streams in the watershed generally drain in a northwesterly direction to San Francisco Bay. As shown on Figure 2-5, unlike other WMAs in the Santa Clara Basin, most of the stream miles within the Coyote WMA are unmodified channels.

Coyote and Anderson reservoirs (22,925 and 89,073 acre-feet, respectively) capture runoff from the upper Coyote WMA and areas beyond the WMA boundaries. Anderson Reservoir's purpose is to facilitate groundwater recharge in the Santa Clara Valley groundwater basin, provide emergency water supply, and provide flood protection (PVWMA et al. 2007). Flows in the lower watershed are highly regulated by these reservoirs, which are managed largely for groundwater recharge. The Hayward and Calaveras faults are major potentially active earthquake faults that cross the watershed. The upper Coyote WMA includes unincorporated, predominantly agricultural areas. The entire city of Milpitas and portions of San Jose and Morgan Hill lie within the WMA boundaries (SCVWD 2001).

Pajaro Watershed

The Pajaro Watershed is one of the Central Coast's largest watersheds and is well-known for its world-class agricultural soils and powerful flooding characteristics (DWR 2009). Most of the watershed is mountainous or hilly, with level lands confined to the floodplains of Pajaro River and its tributaries (Central Coast RWQCB 2005). Unlike streams of the Santa Clara Basin, the Pajaro River drains directly to the Pacific Ocean, near the geographic center of Monterey Bay.

Major sub-watersheds within the Pajaro River Basin include the San Benito River and Tres Pinos, Uvas, Llagas, and Corralitos creeks, of which Uvas and Llagas creeks are within the Program Renewal Area (Figure 2-1). Agriculture has long been the dominant land use in the watershed and is a major source of nutrients and sediment loading to the Pajaro River. However, in recent years, substantial portions of the upper watershed area have been developed into residential subdivisions. In addition to residential and agricultural uses, historic mercury mining activities occurred in the Hernandez Lake area and gravel mining occurred along Pajaro and San Benito rivers (Central Coast RWQCB 2005).

Pajaro WMA

The Pajaro WMA is located within San Benito, Santa Clara, Santa Cruz, and Monterey counties and encompasses approximately 1,300 square miles (Figures 2-1 and 2-6, and Figure 3.9-4) (PVWMA et al. 2007). As noted above, Uvas and Llagas creeks lie within the Pajaro WMA, while the Pajaro River itself forms the southern boundary of the WMA. Uvas and Llagas creeks originate in the mountains to the west and flow in a generally south-southeastern direction

before joining the Pajaro River. Pacheco Creek is also within the WMA in the eastern portion (see Figure 2-1). As shown in Figure 2-6, the majority of stream miles in the Pajaro WMA are unmodified.

Major reservoirs in the Pajaro WMA include the Chesbro and Uvas reservoirs. Chesbro Reservoir discharges to Llagas Creek, and Uvas Reservoir discharges to Uvas Creek. Anderson Reservoir discharges to Coyote Creek, outside of the Pajaro Watershed, but was historically connected to the Pajaro River Basin via a pipeline. The purpose of Chesbro and Uvas reservoirs is to facilitate groundwater recharge in the Gilroy–Hollister groundwater basin (Chesbro Reservoir also is managed for flood protection). Municipalities that are partially or entirely within this WMA include San Jose, Morgan Hill, and Gilroy.

Channel Types and Drainage Features

As discussed in Chapter 2, *Project Description,* all Program Renewal maintenance activities would take place in channels below the 1,000-foot elevation contour. Within this zone, channels can be categorized into two broad types: modified and unmodified. In the simplest terms, modified channels are those that have been substantially altered from historical conditions. Some modified channels have had capital improvement projects (CIPs), while others were constructed in conjunction with land development projects or to maximize developable land adjacent to a creek. Most modified channels have established design flow conveyance criteria and will be maintained to those criteria. However, many modified channels were not built according to an engineered design with established design flow conveyance criteria.

By contrast, unmodified channels have not been substantially altered through human intervention (to Valley Water's knowledge) and are generally similar in form and location to the channel under historic conditions. Unmodified channels may have small areas of modification, including bridges, outfalls, culverts, gauges, or other appurtenant structures. Unmodified channels are usually in areas without other types of flood protection measures and generally occur in the foothills or higher elevations of the Program Renewal Area.

Refer to Chapter 2 for the full descriptions of modified and unmodified channel types. Representative photographs of the modified and unmodified channel types are provided in Figures 2-7 and 2-8. Beyond these broader types, channel types can be further broken down. Specifically, four primary channel types are found in which maintenance may occur: natural or mixed channels on alluvial fans, mixed or concrete tributary channels on the Bay plain, mixed or concrete mainstem channels on the Bay plain, and tidally influenced channels. An overview of each of these channel types is described next; proposed maintenance activities related to channel morphology also are discussed.

Type 1: Natural or mixed channels on alluvial fans

As streams transition from headwaters and canyons in the bedrock uplands to the foothill alluvial fans, channel slopes decrease, and channel widths generally increase. As a result, sediment transport capacity decreases and bedload deposition increases. Unmanaged, sediment deposition in Valley Water-maintained channels reduces flow conveyance capacity, resulting in increased flooding risks. Consequently, under the existing Stream Maintenance Program (SMP-2), Valley Water actively maintains channel capacity by removing accumulated sediment and managing vegetation (to control hydraulic roughness), and it would continue to do so under the Program Renewal. Under the existing SMP-2, these

maintenance activities have occurred on numerous creeks throughout the foothills region, including streams such as Permanente, Calabazas, Penitencia, and Alamitos creeks, and such maintenance would continue under the Program Renewal.

Type 2: Mixed or concrete tributary channels on the Bay plain

This stream type includes the small to medium sized channels on the Bay plain that are tributary to the main streams that discharge to the Bay. Some of these channels have been engineered and straightened for flood protection and land development purposes, while others remain in a more natural state. Most of these drainages have seasonal stream flows, unless fed by artificial drainage (e.g., golf courses) or dam releases.

Channels on the Bay plain are depositional under natural conditions. Historical modifications to these channels, such as expanding cross-sectional areas for flood protection, often increase the rate of sedimentation. In-channel structures (such as weirs, bridges and culverts that control stream grade or alter hydraulics) also may influence sediment transport capacity and depositional patterns in these channels. Valley Water actively maintains channel capacity by removing accumulated sediment and managing vegetation. Streambank protection also is common in this channel type.

Type 3: Mixed or concrete mainstem channels on the Bay plain

This channel type includes the major drainages on the valley floor, such as the lower reaches of Adobe, Permanente, Stevens, Calabazas, San Tomas Aquino, and Coyote creeks, the Guadalupe River, and Sunnyvale East and West channels. **Figure 2-9** provides a diagrammatical cross section of this channel type.

Similar to the tributary channels, the main drainages on the Bay plain are depositional under natural conditions. Channelization and channel modification activities that have straightened, widened, and deepened these stream channels have further supported depositional processes. Valley Water has undertaken several CIPs that were intended to reduce the need for ongoing sediment management by restoring the geomorphic function of these channels. This has involved construction of multistage channels and bypass features to more efficiently manage sediment discharge. Nevertheless, in many situations Valley Water must still actively maintain channel capacity by removing accumulated sediment. Bank stabilization, vegetation management, and streambank protection activities also are common in this channel type.

Type 4: Tidally Influenced channels

The delta (river to estuary interface) portions of the Type 3 channels described above are tidally influenced. The channels in this region are typical of brackish tidal sloughs with wide and shallow cross sections and tall emergent vegetation on the channel margins. Substrate is generally poorly consolidated, fine-textured marine and alluvial sediment. Program Renewal maintenance activities in this channel type generally would include bank stabilization, sediment removal, and vegetation management.

Stream Dynamics and Sediment Balance

In general, the flood protection channel network is a depositional environment and sediment accumulates over time. This applies especially to modified channels that are lower in the

watershed; however, unmodified channel reaches may also be net depositional due to the factors discussed below.

The cause for this net depositional condition is primarily based on the flood management channels mostly being located in lower watershed locations that are naturally more depositional, as they receive sediment inputs from higher areas in the watershed. Additionally, because flood management channels contain flows up to their design magnitudes, the sediment in these flows is contained within the channel and does not go into overbank locations, except during floods that exceed the channel capacity. This results in the flood control channels accumulating sediment. In addition to this, land use practices and other watershed drainage modifications that have resulted in increased sediment transport to lower watershed locations have also exacerbated this situation. Historically, before development and channelization, the streams in the Program Renewal Area periodically overtopped their banks and deposited sediment onto the adjacent floodplain. Non-channelized streams also migrated across the floodplain, seeking the most efficient pathway downstream. These pre-channelization geomorphic processes can be reviewed in standard geomorphic texts such as Dunne & Leopold (1978), Ritter (1986), or Mount (1995). Once flood protection channels were established in the Program Renewal Area to reduce overbank flooding, these channels lost their ability to spread and distribute sediments across adjacent floodplains. Upstream sediment sources, however, have not been reduced. The net result of these processes is that sediment is delivered to channels that are restricted from depositing and storing this sediment on their adjacent floodplains. The channels themselves have become the reservoirs for sediment storage. The baseline flood protection channel system is and will continue to be largely depositional and requires periodic sediment removal to help the streams' design flow conveyance capacities to be maintained.

With respect to the WMAs and streams discussed above, the stream reaches higher in the watershed areas are most likely to remain in an unmodified or "unknown" condition (see Figures 2-2 through 2-6). These reaches typically experience more variable flows based on their position at higher elevations and are more likely to serve as sediment sources (e.g., be net erosional). These stream reaches also are often not surrounded by substantial urban development. For unmodified stream reaches lower in the watershed (i.e., closer to the Bay), these reaches could be subject to the factors described above – and thus, be net depositional in nature. In particular, the unmodified streams within urban areas may still be constrained from depositing sediment in adjacent floodplains due to the nearby urban and suburban development.

Groundwater

The Program Renewal Area overlies two primary groundwater subbasins, as mapped by DWR (DWR 2024): the Santa Clara Valley Groundwater Basin, Santa Clara Subbasin (2-009.02) and the Gilroy–Hollister Valley Groundwater Basin, Llagas Area Subbasin (3-003.01). As noted above, both of these subbasins are designated high priority by DWR, pursuant to CASGEM and SGMA (DWR 2024).

The Santa Clara Subbasin underlies the northern portion of the Program Renewal Area and has an area of 153,600 acres (DWR 2004a). The subbasin is bounded by the Diablo Range on the west and the Santa Cruz Mountains on the east, extending from the northern border of Santa Clara County to the groundwater divide near the Town of Morgan Hill. Water bearing formations of the Santa Clara Subbasin include Pliocene to Holocene age continental deposits

of unconsolidated to semi-consolidated gravel, sand, silt, and clay (DWR 2004a). Natural recharge occurs principally as infiltration from streambeds that exit the upland areas within the drainage basin and from direct percolation of precipitation that falls on the basin floor. Additionally, Valley Water conducts an artificial (facility) recharge program that accounts for approximately 35 percent of total recharge in Valley Water's jurisdiction (DWR 2004a). Land subsidence has been a problem in the Santa Clara Subbasin in the past; however, groundwater levels have generally increased since 1965 as a result of increases in recharge and decreases in pumpage. The operational storage capacity of the Santa Clara Subbasin is estimated to be 350,000 acre-feet (AF) (DWR 2004a).

The Llagas Subbasin occupies a northwest trending structural depression to the southeast of the Santa Clara Subbasin, and in the southeastern portion of the Program Renewal Area. The basin is bounded on the east by the Diablo Range and on the west by the Santa Cruz Mountains, stretching from the groundwater divide at Cochrane Road near the City of Morgan Hill in the north to the Pajaro River in the south (DWR 2004b). The water bearing formations of the Llagas Subbasin include Pliocene to Holocene age continental deposits of unconsolidated to semi-consolidated gravel, sand, silt, and clay. These include the Santa Clara Formation and the valley fill materials (alluvial and alluvial fan deposits) which constitute the principal water producing formations (DWR 2004b). Recharge to the Llagas Subbasin occurs from a variety of sources: natural recharge from streams, principally Uvas and Llagas Creeks; percolation of precipitation and surplus irrigation waters; seepage along canals; subsurface inflow; and artificial recharge. Groundwater well monitoring has generally indicated that groundwater levels in the Llagas Subbasin have remained fairly stable over time. The operational storage capacity of the Llagas Subbasin is estimated at 150,000 AF (DWR 2004b).

Flooding

The Program Renewal Area is inclusive of all major streams within Valley Water's jurisdiction, and Program Renewal activities would generally take place within or adjacent to streams (i.e., within the floodplains). Depending on the specific characteristics of streams, the mapped FEMA flood hazard area of a given stream may be limited to the immediate channel (e.g., if a levee is protecting adjacent areas) or extend some distance laterally from the defined channel.

3.9.4 Impact Analysis

Methodology

The impact analysis baseline for this section is the existing conditions at the time of the May 2022 publication of the Notice of Preparation. The section evaluates potential impacts from the maintenance activities that would be implemented for the Program Renewal. In general, the maintenance activities would be a continuation of Valley Water's current SMP-2 practices, albeit with some modifications, as described in Chapter 2, *Project Description*.

Potential impacts to hydrology and geomorphology were evaluated based on a qualitative assessment of how the Program Renewal could affect hydrologic or geomorphic functions (e.g., runoff, erosion, sedimentation), considering implementation of Valley Water BMPs (see below). Alterations to flooding conditions also were considered, under the basic assumption

that stream maintenance activities would be intended to reduce flood risk. Potential short-term and long-term impacts of maintenance activities were considered.

Criteria for Determining Significance

For the purposes of this analysis, the Program Renewal would result in a significant impact on hydrology or geomorphology if it would:

A. substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;

B. substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

   i. result in substantial erosion or siltation on- or off-site;

   ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;

   iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems;

   iv. impede or redirect flood flows;

C. conflict with or obstruct implementation of a sustainable groundwater management plan.

Environmental Impacts

Impact HYD/GM-1: Substantially Decrease Groundwater Supplies or Interfere Substantially with Groundwater Recharge Such that the Project May Impede Sustainable Groundwater Management of the Basin (Less than Significant)

The Program Renewal could use relatively minor amounts of groundwater (e.g., for dust control, equipment cleaning, mixing concrete). Given the region's dependence on groundwater for supply, it is likely that any water used during implementation of Program Renewal activities could have ultimately been sourced from groundwater. However, given the limited scale of the activities and need for water, the effects would be less than significant and would not substantially decrease groundwater supplies. Moreover, none of the maintenance activities would involve substantial creation of new impervious surface area (apart from minor amounts potentially associated with "hard" bank stabilization treatments) over the long-term, and thus would not substantially interfere with recharge processes. Establishment/use of staging areas for certain maintenance activities could potentially lead to soil compaction at specific sites (e.g., due to vegetation clearing and operation of heavy equipment), which could limit groundwater recharge; however, the scale and severity of these effects would not be substantial.

The majority of the creek channels maintained by Valley Water are earthen, as opposed to having concrete-lined beds and banks. These creek channels provide passive avenues for groundwater recharge under existing conditions, as water is allowed to percolate through the streambed to shallow and deeper groundwater aquifers below. The current sediment

transport conditions in the Program Renewal Area generally encourage accumulation of fine materials in stream channels, particularly where vegetation is overgrown and where the longitudinal slope of the channel is low. Groundwater recharge capacity is reduced in these locations as fine sediments clog pores and interstices between bed sediments. Over time, this reduces the rate at which surface water in the channels percolates to groundwater.

In this regard, sediment removal activities under the Program Renewal (which typically would remove accumulated fine sediment) would improve groundwater recharge conditions relative to baseline. Similarly, bank stabilization activities would assist in reducing fine sediment inputs to the channels, which would minimize adverse effects to groundwater recharge rates. Implementation of BMPs (see Chapter 2, *Project Description*, and the summary descriptions below) would ensure that bank stabilization design provides protection to prevent potential downstream erosion and associated transport/deposition of fine sediment and would help to minimize erosion and sedimentation caused by implementation of the Program Renewal activities (e.g., via ground disturbance within and adjacent to stream channels).

Over the longer term (following maintenance activities), implementation of BMPs would ensure that channels are left in a condition such that substantial erosion and sedimentation would not occur – thereby minimizing any impacts to groundwater recharge rates due to fine sediment deposition. Additionally, any new impervious surface associated with certain "hard" bank stabilization treatments (see **Table 2-4** in Chapter 2, *Project Description*) would be minor in the context of the larger stream channel/bank and would not substantially affect groundwater recharge.

In some respects, vegetation management activities could increase stream flow velocities and thereby possibly reduce groundwater recharge rates. As water passes over the streambed more freely (with reduced channel roughness), it would have less time to percolate through to groundwater aquifers below. However, the vegetation management activities (e.g., invasive plant management) also would support the growth of healthy riparian vegetation along channel banks, which could assist in the reduction of fine sediment inputs to the channels, thus resulting in beneficial impacts to groundwater recharge. Likely, these factors would balance out and the overall effect of vegetation management on groundwater recharge/supplies would be neutral or positive. Other maintenance activities (e.g., downed tree management, management of animal conflicts, and various minor maintenance activities) would likely have a minimal effect on groundwater supplies and recharge.

As discussed further in Impact HYD/GM-3, the Program Renewal Area is underlain by the Santa Clara Subbasin and Llagas Subbasin, both of which are designated high priority by DWR (2024). Valley Water is responsible for managing these subbasins and implements its GWMP pursuant to SGMA. The discussion in Impact HYD/GM-3 further discusses how the Program Renewal would not substantially affect groundwater supplies or recharge and would not impede Valley Water's ability to sustainably manage the subbasins.

Applicable Best Management Practices

The BMPs summarized below would be implemented as part of the Program Renewal activities to help minimize impacts to groundwater supply and recharge. A full description of each BMP is provided in Chapter 2, *Project Description,* **Table 2-10**.

- **BMP GEN-1: In-Channel Work Windows** would require that ground-disturbing maintenance activities occur between June 15 and October 15 unless an extension is granted, based upon identified criteria, and would minimize potential for erosion and sedimentation associated with ground-disturbing activities.
- **BMP GEN-21: In-Channel Minor Activities** would require that in-channel minor work activities be conducted from the top of bank if access is available and there are flows in the channel; this would minimize potential for disturbance of the streambed and banks during the maintenance activities.
- **BMP GEN-25: Erosion and Sediment Control Measures** would require that erosion and sediment control measures (e.g., silt fences, straw bale barriers, brush or rock filters, storm drain inlet protection, temporary sediment traps, temporary sediment basins, erosion control blankets and mats, soil stabilization, wood chips, and straw mulch) be implemented during Program Renewal activities. BMP GEN-25 would also require visual inspections and corrective actions to ensure BMPs are functioning correctly and would help to limit potential adverse hydrology and geomorphology impacts from Program Renewal activities, particularly those involving ground disturbance.
- **BMP GEN-26: Staging and Stockpiling of Materials** would impose requirements on staging and stockpiling of materials to minimize potential impacts to hydrology/water quality, such as requiring that staging areas be located on access roads, surface streets, or other disturbed areas that are already compacted and only support ruderal vegetation. BMP GEN-26 would also require that stockpiled soils or other materials not remain exposed during the wet season, unless adequately stabilized/contained, which would further minimize potential for sediments to be discharged to stream systems.
- **BMP GEN-27: Sediment Transport** would require that truck beds used to transport spoils to disposal locations be lined with an impervious material or that the tailgate be blocked, so as to prevent sediment-laden water from being released back into waterways.
- **BMP GEN-28: Stream Access** would require that Valley Water personnel use existing ramps and roads to the extent feasible in accessing Program Renewal work areas. When temporary access points are necessary, disturbed areas must be revegetated or otherwise stabilized, and disturbance of the stream bottom will generally be avoided. This will further limit potential erosion and sedimentation associated with Program Renewal activities.
- **BMP SED-2: Prevent Scour Downstream of Sediment Removal** would require that channels be graded to ensure a smooth transition zone following sediment removal activities to prevent potential erosion following restoration of flows. This would help to minimize undesired effects on channel characteristics resulting from Program Renewal activities.
- **BMP SED-3: Restore Channel Features** would require that low-flow channels within non-tidal streams be contoured to facilitate fish passage and emulate the pre-construction conditions as closely as possible within the finished channel topography.
- **BMP VEG-1: Minimize Local Erosion Increase from In-channel Vegetation Removal** would require that the toe of the bank be protected by leaving vegetation to the maximum extent possible, such as to minimize the potential effect of localized erosion.

This would reduce potential for erosion of streambanks, and associated downstream sedimentation, associated with the Program Renewal activities over the long term.

- **BMP VEG-3: Use Appropriate Equipment for Instream Removal** would require that low–ground pressure equipment (e.g., tracked wheels) be utilized for cutting or removing instream vegetation to reduce impacts to the streambed.
- **BMP BANK-1: Bank Stabilization Design to Prevent Erosion Downstream** would require that the site design for bank stabilization activities provide proactive protection of vulnerable areas within the reach of the worksite (e.g., appropriately keyed-in coir logs, riparian planting, strategic placement of rock, and flow deflectors) to prevent potential downstream erosion impacts. Bank stabilization shall also include appropriate transition designs to prevent potential erosion impacts.
- **BMP REVEG-1: Seeding** would require that sites where maintenance activities result in exposed soil be stabilized to prevent erosion; specifically, through seeding with native seed after maintenance activities are complete.

Conclusion

Given the Program Renewal's minimal effects on groundwater, and with implementation of the BMPs, Program Renewal activities would not substantially decrease groundwater supplies or substantially interfere with groundwater recharge, and there would be no impedance of sustainable management of the groundwater basin. The impact would be **less than significant.** No mitigation would be required.

Impact HYD/GM-2: Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River or Through the Addition of Impervious Surfaces, in a Manner Which Would:

i. Result in substantial erosion or siltation on- or off-site (Less than Significant)

The Program Renewal would alter the existing drainage pattern of the site or area in the sense that sediment removal, vegetation management, bank stabilization, and related activities would change the physical characteristics of stream channels (e.g., capacity, channel roughness, cross-sectional area). This, in turn, would change the flow patterns and rates within the channels, although largely this would be to return or restore the channels to historical norms or design. The Program Renewal would not add substantial new impervious surfaces; however, certain activities could potentially increase surface runoff rates from specific areas (e.g., staging areas), as discussed further below. Generally, the potential erosion/siltation effects of the Program Renewal can be separated into shorter term, construction-related effects and longer term, operational effects – these two categories are discussed separately below.

Construction/Short-Term Effects

As described in Section 3.14, "Water Quality" (Impact WQ-1), various Program Renewal activities, including bank stabilization and sediment removal, would disturb soil on the bed and banks of streams. To a lesser extent, vegetation management, management of animal conflicts, and minor maintenance activities (e.g., limited grading) may involve ground disturbance near or within stream banks. Such ground disturbance could loosen soils and potentially lead to subsequent erosion and sedimentation/siltation. In addition to impacts to

the stream channel, establishment and use of staging areas and temporary access roads or ramps for Program Renewal activities could result in erosion and siltation, particularly if protective measures are not implemented. Additionally, stockpiled soils (if not properly stabilized) could erode and allow for discharge of fine sediment to nearby surface waterbodies.

Moreover, removal of vegetation (e.g., cattails, instream woody vegetation, etc.) can increase erosion potential in the short-term where bare ground is left exposed. Sediment that erodes from these areas during subsequent flow events could travel downstream and aggrade in a downstream location. Additionally, apart from the active ground disturbance from construction equipment/activity during bank stabilization activities, erosion could occur during the period when banks are left exposed (e.g., before new plantings have become established) following stabilization treatments.

As discussed above, under existing conditions, the geomorphology of many streams within the Program Renewal Area has been affected by hydromodification, including hardscape development, constraining of the natural floodplain, and operation of dams/reservoirs. While erosion and sedimentation/siltation are natural processes, and many streams are more depositional in their lower reaches, the dynamics are changed in Program Renewal Area systems due to the anthropogenic factors listed above. In this respect, prior adverse effects are incorporated into baseline and the Program Renewal is serving to counteract the excessive accumulation of sediment (and vegetation growth) that is contrary to flood protection objectives. Nevertheless, if Program Renewal activities were to cause substantial erosion and siltation over the short-term due to ground-disturbing activities, this would be a significant effect under CEQA. The longer-term effects of sediment removal and other Program Renewal activities on stream systems/geomorphology are discussed further under "Operation/Long-Term Effects" below.

Valley Water would implement BMPs during Program Renewal activities (see the summary descriptions below), which would ensure that erosion and siltation over the short-term due to ground-disturbing activities would not be substantial.

Operation/Long-Term Effects
